a magical double of himself, that he ascended to heaven to
teach his mother who had died, and that he tamed a wild
elephant. The Buddha also formed a monastic order of
monks and nuns, though the Buddhist community
(sangha) included laymen and laywomen as well. During
this time, other accounts also suggest that the Buddha’s
authority was challenged by his cousin Devadatta.

At age eighty, the Buddha died. Just prior to his
death, the Buddha delivered one final message and lay
down between two trees. According to tradition, the
Buddha’s death signaled his parinirvāṇa, or his release
from the cycle of birth and rebirth. Following this event,
his followers cremated his body and distributed his relics to be enshrined in what are known as stupas.

With no named successor, a council of elders formed and orally perpetuated the Buddha’s teachings. Centuries later, canonical collections of his teachings were created, such as the Tripitaka. These scriptures contain material directly attributed to the Buddha (buddhavacana) as well as authoritative commentaries. Elaborate works of art depicting various events from the Buddha’s life were also developed. Devotees lavished gifts on relics associated with the Buddha and annually celebrated his birth, enlightenment, and entrance into nirvana. Sites associated with the Buddha’s life served as places of pilgrimage. These included his birthplace (Lumbini), the setting where he achieved enlightenment (Bodh Gayā), the location of his first sermon (Deer Park), and his place of death (Kuśinagara).

GROWTH OF BUDDHISM

Because Buddhism— unlike Hinduism— operated outside of the caste system, allowing its followers to interact freely with others, this helped it to spread beyond India and into other parts of Asia following the Buddha’s death. Different Buddhist traditions eventually took shape, spreading and elaborating on the Buddha’s teachings within various cultural contexts. The Theravāda tradition (literally “doctrine of the elders”) claims to adhere strictly to the Buddha’s original teachings. The Mahāyāna tradition, however, often referred to as the “Great Way,” recast many of the more traditional positions. In one key example, the Mahāyāna give a higher priority to the bodhisattva—the person who puts off nirvana to help others achieve enlightenment—as opposed to the arhat ideal, in which individuals focus on achieving enlightenment for themselves. The Buddha’s life, then, was reread as the quintessential model of the bodhisattva ideal. Numerous other traditions would follow as the religion initiated by the Buddha spread, ultimately attracting followers across the globe. By the nineteenth and twentieth centuries, for example, many Westerners became fascinated by the Buddha’s life and teachings, as can be seen in the popularity of Siddhārtha (1922), a novel by Hermann Hesse. As Buddhism attracted adherents in countries such as the United States, however, many criticized Westerners for promoting superficial forms of Buddhism and of the Buddha’s teachings.

At the start of the twenty-first century there were approximately 400 million Buddhist adherents worldwide. Though the various Buddhist schools differ on the exact nature of the Buddha’s teachings and how to interpret them, the Buddha remains a venerated figure for all Buddhists; his life and teachings continue to shape the religious sensibilities of numerous followers around the world.

BUDDHISM

With roughly 400 million adherents worldwide, Buddhism represents one of the world’s largest religious traditions. Originating in India, the majority of Buddhists are now found in China, Japan, North and South Korea, Mongolia, Sri Lanka, Thailand, Tibet, and North and South Vietnam. Buddhism also spread to Western nations such as the United States and Canada beginning in the nineteenth century. Since its inception, Buddhism has developed along numerous trajectories and in different cultural settings. Though certain commonalities historically unite the various Buddhist communities—such as a commitment to the “Three Jewels of Refuge” (i.e., the Buddha, his teachings, and the Buddhist monastic community)—it is difficult to isolate a definitive set of beliefs and practices shared by all Buddhists.

EARLY HISTORY AND PRACTICES

The history of Buddhism begins with the career of Siddhārtha Gautama. Scholars generally deem Gautama a historical figure who passed along to his followers the foundations of Buddhist philosophy and practice. Traditionally, Gautama was believed to have lived circa 560–480 BCE, while more-recent scholarship suggests the later dates of circa 485–405 BCE. Though Buddhists
maintain that there have been numerous buddhas throughout history, most consider Gautama the Buddha for this age (though some hold that there can be more than one buddha per age). Accurately reconstructing the precise details of the Buddha's life and teaching, however, proves difficult. The first biographies of his life did not appear until centuries after his death and it is often impossible to ascertain exactly where the biographies reconstruct the Buddha's life according to ideal patterns as opposed to historical realities.

According to tradition, Gautama's previous lives prepared him for his final reincarnation before achieving the status of Buddha. At age twenty-nine, Gautama's life was profoundly altered when he ventured outside the palace and encountered “four signs”: an old man, a sick person, a corpse, and a mendicant (Buddhist sources indicate that the gods orchestrated these events). Troubled by what he saw, Gautama embraced the life of an ascetic for the next several years and searched for an answer to the suffering he had encountered. According to Gautama's biographers, six years after leaving the palace he finally experienced enlightenment. One night he sat under a bodhi tree, determined not to leave until he found an answer to the perennial problems of suffering and death. Though some traditions differ as to the exact nature of his enlightenment that night, the biographers agree that Gautama achieved the status of a buddha; he eliminated the ignorance that trapped individuals in the suffering (dukkha) associated with the endless cycle of reincarnation.

Following this experience, the Buddha preached his first sermon, often referred to as the “first turning of the wheel of dharma.” Though it is important to note that many of the Buddha's teachings reflect the influence of Hinduism, the Buddha thoroughly modified various Hindu concepts and did not embrace the Hindu caste system. The theme of his teaching revolved around the Four Noble Truths. The first Noble Truth stipulated the reality of suffering. Put simply, suffering persists throughout all the various stages of life. The second Noble Truth indicated that desire (trṣṇa) originated from ignorance (avidyā) and inevitably caused suffering. According to the Buddha, humans mistakenly posit the existence of an autonomous, permanent self (ātman). As such, they inevitably experience suffering as they try to maintain a permanent hold on things that are constantly changing and impermanent. Instead, the Buddha's teachings advanced the doctrine of "no-self" and insisted on the impermanence of all things. The third Noble Truth, the cessation of suffering (nirvāṇa, literally “blowing out”), claimed it was possible to eliminate desire and ignorance and free an individual from suffering. Finally, the fourth Noble Truth pointed to the path that brings about the cessation of suffering, often referred to as the Eightfold Path. The path includes (1) right view, (2) right intention, (3) right speech, (4) right conduct, (5) right livelihood, (6) right effort, (7) right mindfulness, and (8) right concentration. This “Middle Path” avoids both the extreme of self-denial and the extreme of self-indulgence and leads an individual to recognize the impermanence of all things.

Often, the different parts of the Eightfold Path are grouped under three main headings: moral precepts, concentration, and wisdom. The moral precepts (āśīla) usually include basic prohibitions against killing, stealing, lying, sexual promiscuity, and intoxication (these are commonly accepted by most Buddhists, though monks and nuns usually adhere to more stringent guidelines). Concentration (samādhi) involves various forms of meditation that differ among Buddhist traditions. Generally, however, Buddhist meditation requires careful control of the process of breathing and discipline of the mind. Finally, wisdom (prajñā) reflects the necessary insights required to eliminate desire and ignorance and achieve enlightenment.

Following his experience of enlightenment, the Buddha continued to teach throughout northeastern India for the next forty-five years. With no named successor upon his death, a council of elders formed and orally perpetuated the Buddha's teachings. Centuries later, the oral traditions associated with the life of the Buddha were codified in Buddhist scriptures; these scriptures contained material directly attributed to the Buddha (buddhavacana) as well as authoritative commentaries. The earliest extant canon, the Pāli canon (also referred to as the Tripitaka), consists of Vinaya (monastic law), Sūtras (the Buddha's discourses), and Abhidhamma (commentaries). The Chinese canon and the Tibetan canon took shape at later dates and incorporated new material.

As Buddhism grew following the Buddha's death, ritual practices developed along various trajectories. For example, though differences appeared among the various Buddhist traditions regarding their view of the Buddha, he remained a venerated figure for all Buddhists. Devotees lavished gifts on relics associated with the Buddha and annually celebrated his birth, enlightenment, and entrance into nirvana. Sites associated with the Buddha's life soon became places of pilgrimage. These included his birthplace (Lumbini), the setting where he achieved enlightenment (Bodh Gayā), the location of his first sermon (Deer Park), and his place of death (Kuśinagara). Beginning in the common era, artists created images of the Buddha. Furthermore, Buddhist monastic communities (sangha) quickly formed after the Buddha's death. Ordination ceremonies took shape for both monks and nuns, signaling their abandonment of worldly pursuits. Laypersons also began to venerate monks for their spiritual attainments and frequently showered them with gifts and offerings. Buddhist funeral and protective rites also emerged.
In time, Buddhism spread beyond India and also began to influence the activities of states. Beginning in the third century BCE, for example, Asoka (c. 300–232 BCE), the emperor in India, took on the title of “righteous king” (dharma-rāja) and formally supported the monasteries. Asoka’s son, Mahinda (c. 270–c. 204 BCE), then carried the Buddhist message outside his homeland and attracted followers in Southeast Asia. At the beginning of the common era, Buddhist missionaries entered China and spread their message through the efforts of figures such as Bodhidharma (c. early fifth century CE) and Kumārajīva (350–409/413 CE). While early Hindu missionaries also accompanied traders and merchants and helped spread Hinduism to Southeast Asia during the same period, Buddhism had key advantages that facilitated its growth. In particular, unlike Hinduism, Buddhism operated outside of the caste system, allowing its followers to interact freely with others. (This advantage carried over into the twentieth century as the Indian politician B. R. Ambedkar gained a large following among fellow Dalits [“untouchables” within the Hindu caste system]; Ambedkar viewed Buddhism as a solution to the social inequality associated with the Hindu caste system and encouraged Hindus to convert.) Through these missionary efforts, different Buddhist traditions formed as Buddhist practices and beliefs often underwent significant modification as they took root in various cultural contexts.

MAJOR BUDDHIST TRADITIONS

The Theravāda (literally “doctrine of the elders”) tradition claims to adhere strictly to the Buddha’s original teachings. It treats the Pāli canon as the only authoritative Buddhist scriptures and perpetuates the Hinayāna tradition from the earliest days of Buddhism (within Buddhist literature, Hinayāna, literally the “Inferior Way,” served as a pejorative term directed at more conservative Buddhists). The Mahāyāna tradition usually focuses on particular teachings of the Buddha, referred to as the “second turning of the wheel of the dharma,” believed to have been passed along by a select group of Buddhists for centuries following his death. Unlike Theravāda Buddhism, Mahāyāna allows for the possibility of multiple buddhas to exist at the same time. Not surprisingly, alongside the historical Buddha, a number of other buddhas and bodhisattvas have appeared over the centuries. Accordingly, various Mahāyāna festivals have developed to venerate these figures. In general, Mahāyāna gives a higher priority to the bodhisattva, the person who puts off nirvana to help others achieve enlightenment; it also stresses the virtues of compassion (karuṇā) and wisdom (prajñā). The Buddha’s life is reread as the quintessential model of the bodhisattva ideal that values highly a strong sense of communal responsibility. Usually, the Mahāyāna sense of communal responsibility is read as a reaction to the Theravāda arhat ideal in which Buddhists focus on achieving enlightenment for themselves in an individualistic quest for nirvana. Some scholars, however, have begun to complicate the sharp historical distinctions between the Mahāyāna and Theravāda traditions.

A third major tradition in Buddhism, Vajrayāna (literally the “Diamond Way,” also referred to as tantric Buddhism) emerged around the third or fourth century CE as an amalgamation of Buddhism, Hinduism, and other popular religious practices in the region. According to Vajrayāna teachings, principles in the world that appear to be fundamentally opposed are actually united and one. Enlightenment occurs when individuals grasp this reality. Whereas earlier Buddhist sources emphasized a long path to enlightenment, Vajrayāna offers instead enlightenment in this lifetime through the disciplined practice of meditation. Often, adherents visualize various deities during meditation. Among elite practitioners, these deities are often considered representations of inner states within the individual, though this is less often the case for the average adherent.

Vajrayāna proved very influential in the formation of Tibetan Buddhism, though the two terms are not synonymous. (Tibetan Buddhism is often considered a branch of...
Mahāyāna Buddhism, as is Vajrayāna.) According to Tibetan sources, Buddhism arrived in the region during the reign of the first Buddhist emperor Songtsen Gampo (Tib., Srong-btsan sgam-po, d. 649/650). By the twelfth century various Tibetan Buddhist sects emerged. One particular religious order, the Gelukpa (Tib., Dge-lugs-pa, literally “Virtuous Ones’), began to rule in Tibet by the mid-seventeenth century.

Tibetan Buddhists consider the Dalai Lama (a member of the Gelukpa school) an incarnation of the lord of compassion (Avalokiteśvara) and the rightful spiritual and temporal leader of the state. Each Dalai Lama is believed to be a reincarnation of the first Dalai Lama, Gedun Drupa (Tib., Dge-dun-grub-pa, 1391–1474). As a result of the Dalai Lama’s role, Buddhism has historically been intimately tied to politics in Tibet more so than in any other state. The current Dalai Lama (b. 1935), however, lives in Dharmsala, India, following the Chinese invasion of Tibet in 1950 and his exile from there in 1959. Nevertheless, he has gained international recognition for his nonviolent protests against Chinese abuses of Tibetans and received the Nobel Peace Prize in 1989.

Various schools within the three main traditions named above (Theravāda, Mahāyāna, and Vajrayāna) have developed over time. In Japan, for example, the Shingon school represents a form of tantric Buddhism, whereas the eclectic Tendai school adheres more closely to traditional Buddhist practices. Tendai was eventually overshadowed by its more popular offshoots: Pure Land Buddhism, Zen Buddhism, and Nichiren Shōshū, a particularly mission-oriented form of Buddhism that was reinvigorated beginning in the twentieth century through the Sōka Gakkai organization. Numerous other schools have also formed as distinct Buddhist movements within different Asian countries.

MODERN BUDDHISM

Buddhism has undergone important changes during the modern era. Beginning in the sixteenth century, Buddhist nations for the first time came into contact with Western culture as well as Western imperialism. At times, adherents adapted Buddhist practices to Western—and particularly Christian—ways, as can be seen in the adoption of Sunday meetings and Sunday schools by some Buddhists (in the West, some Buddhist groups also called themselves “churches”). In another sign of changes brought about through globalization, Buddhist societies formed to unite Buddhists worldwide. These include the Maha Bodhi Society (1891), the World Fellowship of Buddhists (1950), and the World Buddhist Sangha Council (1966).

Ultimately, Buddhism spread to the West during the nineteenth and twentieth centuries. One form of Mahāyāna Buddhism, Pure Land Buddhism, would eventually find a significant following in the United States. One of the most prominent subbranches of the Mahāyāna tradition, Pure Land Buddhism focuses on the figure of Amida Buddha, who was believed to have formed the “Pure Land” once he achieved buddhahood. In turn, individuals who devote themselves to the Amida Buddha are reborn in this Pure Land and achieve enlightenment. In a significant revision of traditional Buddhist teachings, Pure Land Buddhism emphasizes trust in the Amida Buddha as the key to enlightenment and places less stress on self-effort. Scholars often point to the strong similarities between these teachings and aspects of Christianity to help explain the success of Pure Land Buddhism in the West.

Zen Buddhism, another Mahāyāna school, has also been successful in the West. Literally Japanese for “meditation,” the Zen tradition grew out of the Chan school in China and traces its lineage back to the historical Buddha. The movement stresses experience through the disciplined practice of meditation and often plays down the importance of Buddhist scriptures. There are three contemporary schools in Japan—Rinzai, Šôtô, and Obaku—that perpetuate these highly specialized forms of meditation.

In the West, Rinzai Zen first gained attention when Shaku Šōen (1859–1919) attended the World’s Parliament of Religions in Chicago, Illinois, in 1893. He wrote books extolling Zen as a rational religion that fit well with modern trends. During the first half of the twentieth century, Shaku Šōen’s disciple, D. T. Suzuki (1870–1966), then continued to promulgate a form of Zen in the United States that was less rigorous than traditional Zen. As awareness of Zen grew in the United States, it eventually became incorporated into popular culture. Though sometimes criticized for promoting a superficial form of Zen, figures such as Allen Ginsberg (1926–1997), Jack Kerouac (1922–1969), Gary Snyder (b. 1930), and Alan Watts (1915–1973) developed what is commonly referred to as “Beat Zen.” Focusing on Rinzai Zen, which stresses sudden enlightenment, these figures embraced a popularized form of Zen during the social upheavals of the 1950s and 1960s in the United States. Here, Zen represented the ideals of liberation and freedom and served as a tool to combat the perceived materialism, imperialism, and consumerism of American society. In addition to Rinzai Zen, Šôtô Zen (which lacks Rinzai Zen’s focus on sudden enlightenment and instead emphasizes quiet meditation) has also attracted a significant number of adherents in various parts of the United States as individuals such as Suzuki Shunryū (1904–1971) established meditation centers. The growth and popularity of both Rinzai and Šôtô Zen in the United States during the twentieth century reflect the increased awareness of Buddhism in the West.
The very practical, empirical nature of Buddhism has also facilitated various forms of spirituality that intermix elements from other religious traditions with Buddhism. Thomas Merton (1915–1968) serves as a prominent example. Merton, an American Catholic monk, sought to develop a dialogue between Christian and Buddhist forms of meditation during the mid-twentieth century (see, for example, his Mystics and Zen Masters [1967]). Also indicative of combinative trends, many Jews have either embraced Buddhism or sought to combine Buddhist insights with their own heritage (see, for example, Rodger Kamenetz’s The Jew in the Lotus: A Poet’s Rediscovery of Jewish Identity in Buddhist India [1994]). Some individuals have also combined Buddhist concepts with various aspects of Western science. While figures such as Watts sought to explain Zen using the terminology of Western science and psychology, others such as Mark Epstein (b. 1953) have also used Buddhist concepts to inform psychotherapeutic models.

Finally, Engaged Buddhism (sometimes referred to as Socially Engaged Buddhism) also represents a recent development within Buddhism. Initiated by figures such as the Vietnamese monk Thich Nhat Hanh (b. 1926), the movement is in part a reaction to a perceived passivity in the contemporary practice of Buddhism. Followers attempt to enlist Buddhism on behalf of various causes and address social and ecological ills. Engaged Buddhism has attracted attention from Buddhist laypersons and monks in both the Eastern and Western world, and had an impact on mainstream Buddhism as a whole. Diverse in its forms and dispersed across the globe, Buddhism has shaped the religious sensibilities of countless adherents throughout history.

Bull and Bear Markets

BULL AND BEAR MARKETS

The origin of the terms bull and bear markets is unclear. Don Luskin (2001) cites an English book by a Thomas Mortimer, printed in 1785 (Every Man His Own Broker, or, A Guide to Exchange Alley), that identifies a “bull” with a trader who invests heavily in stocks on borrowed money in the hope of selling at a profit before the loan repayment date. In contrast, a “bear” was a short-seller, that is, someone who borrows shares and sells them in the present and perhaps lends out as the proceeds at interest because he expects the price of stocks to decline after which he can buy the securities cheaply and return them to the lender.

In any case, the terms bull and bear markets are popularly used and understood to mean durations of successive large stock price increases and large stock price decreases, respectively. The implication is that there is duration dependence in stock prices—that is, once prices begin increasing in a bull market, they tend to continue increasing, whereas decreasing prices in a bear market tend to continue decreasing.

However, there has been disagreement amongst researchers as to whether bull and bear markets exhibiting such duration dependence even exist. It is known that even if price changes are independent, they can after the fact seem to exhibit bull and bear phases; theories based on this idea hold that bull and bear markets are simply the result of after the fact categorization of stock market data. Other theories hold that bull and bear markets do exhibit predictability. And even if there is predictability in prices, they can be of two kinds—rational and irrational. Irrational cycles might be fueled by fads that ignite an increase in stock purchases and then die out, leading to mean reversion in prices. Rational cycles might exhibit bubble-like characteristics—although they might satisfy no-arbitrage conditions, they might still be influenced by nonfundamental factors.
One example of stock price predictability is an economy where, for some reason, a bubble develops, that is, asset prices differ from the present value of all future expected dividends. Prices each period are, nevertheless, equal to the sum of the present values of next period’s expected dividend and next period’s expected asset price. Each period, the economy finds itself in one of two regimes—one where the bubble persists and another where the bubble bursts; the greater the size of the bubble, the greater the probability of the bubble bursting. Simon van Norden and Huntley Schaller (2002) use U.S. stock market returns to test the (irrational) fads hypothesis set in a regime-switching model against a (rational) bubble alternative. They find in favor of the bubble alternative. However, the power of such tests depends strongly on the auxiliary assumptions used, as well as the alternative hypothesis specified. As a result, it is very difficult to reject the “irrationality” hypothesis entirely. For example, Jerry Coakley and Ana-Maria Fuertes (2006) find that market sentiment does play an important transitory role.

There is also a parallel literature that looks at mean reversion in stock prices and the existence of momentum effects in the context of investment strategies (e.g., Jegadeesh and Titman 1993). This literature finds negative autocorrelation in stock prices at short intervals and positive autocorrelation at longer intervals. In any case, there is now a solid body of work that seeks to use quantifiable rules to document and measure the bull and bear markets. There are two widely used algorithms—one by Gerhard Bry and Charlotte Boschan (1971) that mimics the qualitative rules used by the National Bureau of Economic Research to decide upon turning points of business cycles, and another that uses a Markov regime switching model (Maheu and McCurdy 2000).

Asset prices are used as signals by economic agents in several ways. First, because asset prices are considered to be aggregators of information and generally forward-looking, higher asset prices in a given sector are interpreted as greater growth potential in that sector, or concomitantly as a reduction in the cost of capital; this then allows investment to go where there is the greatest potential. Second, they are used as measures of value in various other contexts, such as in executive compensation. Third, asset prices, particularly real estate values, are also used by individuals as measures of wealth to help plan consumption. Finally, the Federal Reserve also uses asset prices to set monetary policy. When asset prices are divorced from true value, all these uses are affected. This is also true when there is a lot of asset price volatility, because the signal to noise ratio drops.

The integrity of the financial infrastructure can also be affected if there is an unexpected swing in asset prices, particularly downward, such as in October 1987, when the U.S. stock market dropped 23 percent in one day. The payments system could be affected, as well as the mechanisms for settling trades in securities markets. Also, because bank loans are often tied to property and stock market values, swings in asset prices are related to swings in lending and hence to swings in consumption and investment. These effects vary across countries. In financial systems characterized by a greater degree of arm’s-length transactions, households are more sensitive to asset prices because market forces are used more than customary relationships for borrowing and investment purposes. Of course, such systems are overall more resilient and able to adjust to changes in growth opportunities. The empirical validity of asset market price swings causing swings in real activity is difficult to establish because any correlation in asset prices and real activity might be due simply to the reflection of future real activity in forward-looking asset prices.

There is also research that shows the generally negative effect of fluctuations in economic activity, that is to say business cycles on growth and human welfare. However, Matthew Rafferty (2005) shows that although unexpected volatility is related to lower growth, expected volatility is related to higher growth. Similarly, Jaume Ventura (2004) suggests that asset price bubbles could moderate the effect of financial market frictions and improve the allocation of investment across countries.

There has been more work recently on the globalization of business cycles and asset price cycles. This is related to the issue of correlation between different geographical asset markets, because lower correlation implies greater value for international portfolio diversification. François Longin and Bruno Solnik (2001) find that correlation between international equity markets has increased in bear markets, but not in bull markets. Javier Gómez Biscarri and Fernando Pérez de Gracia (2002) find that European stock markets seem to have become more concordant over time, as would be expected from the continuing integration of European financial markets. Furthermore, Christian Dunis and Gary Shannon (2005) find that, at least for the United Kingdom and the United States, there are still benefits from diversifying over emerging economy stock markets, ranging from Indonesia, Malaysia, and the Philippines to Korea, Taiwan, China, and India. However, the extent of such benefits may drop off with the continuing integration of India and China into world security and product markets.

BULL MARKET

SEE Bull and Bear Markets.

BUNCHE, RALPH JOHNSON

c. 1904–1971

Ralph Johnson Bunche was an American social scientist and statesman. Two weeks after the State of Israel was established in May 1948, the United Nations Security Council sent a delegation to restore peace between the Arabs and Israelis. Under the leadership of Bunche, the delegation would be singularly successful in achieving direct negotiations between the two groups over territory, an armistice, and a UN peacekeeping force. Yet, fate would have to intervene to put Bunche in the Nobel Prize–winning position when the original head of the delegation, the Swedish diplomat Folke Bernadotte (1895–1948), was assassinated, along with everyone in his car, on an Israeli road. Fortunately for Bunche, he was delayed by the police on his way to meet Bernadotte in their efforts to strengthen the UN role in the region.

Long before going to the Middle East, Bunche had built an academic foundation for his influential career in political science and international relations. That foundation is illustrated by his involvement with a diverse group of Howard University colleagues in a 1935 national conference on “race” in New York. In concert with sociologist E. Franklin Frazier (1894–1962), economist Abram Harris (1899–1963), and philosopher Alain Locke (1886–1954), among others, Bunche gave definition to the second (professorial) phase of his scholarly leadership. For much of his life he would engage in an evolving struggle to balance race-conscious and class-conscious approaches to political and economic analysis. At the same time, he could never easily abandon political engagement for scholarly detachment. He wanted to “change the world” enough to join leftist labor union protests as a young professor and to participate in civil rights demonstrations even after retirement. Yet, he often withdrew to Howard University social science conferences or immersed himself in African- or African American–oriented research. By 1953, however, when he returned to campus for the inaugural Phi Beta Kappa lecture, he had already reached the pinnacle of the third and defining phase of his career: he was a celebrated United Nations diplomat.

Somewhere between his work as a U.S. delegate in the formative weeks of the United Nations in the 1945 talks in San Francisco, and his mediation of the 1949 negotiations leading to an agreement on the Palestinian issues and a foundation for the State of Israel, Bunche left academics to become a renowned international peacemaker. However fragile the peace resolutions he helped fashion in Israel and Africa, they were as solid as any that followed. For example, he labored under hopeless circumstances with limited success in the former Belgian Congo to bring Patrice Lumumba (1925–1961) into reconciliation with military and separatist Congolese factions.

Although his indefatigable pursuit of international conflict resolution earned him the 1950 Nobel Peace Prize, he repeatedly expressed skepticism about the primacy of peace in the foreign policies of UN member nations.
states. In addition to cautions about nuclear war in his speeches, he warned in his Nobel lecture that “some in the world … are prematurely resigned to the inevitability of war.” He added: “among them are the advocates of the so-called ‘preventive war,’ who … wish merely to select their own time for initiating it” (Bunche 1950).

Returning to the United States, the discomfort he had long felt with American racism had become more difficult to tolerate. The optimism of his successful school-days in Los Angeles had long since faded. He had gone from valedictorian at UCLA (1927) to become the first black PhD (1934) in political science, graduating from Harvard University. Although it had not been easy, raised largely by his grandmother in Los Angeles after his early years in Detroit, he worked his way through the universities with some critical scholarship assistance. While supporting his wife, Ruth, with whom he would later have three children, he began working at Howard before he completed his doctorate. Yet the global demands of his career would continually place strains on his family life.

Once settled in the Political Science Department chairmanship at Howard, the black experience and the international exposure came together for him when he worked on the 1940s publication of the groundbreaking study of race relations with the Swedish sociologist Gunnar Myrdal (1898–1987). Although Bunche is not credited as an author of Myrdal’s An American Dilemma (1944), the 3,000-plus pages of research he contributed to the Carnegie report attest to his indispensable role. Better suited to his earlier years than to the second phase of his life, when he saw class conflict as a pivotal issue, the study was optimistic about race relations. The country was increasingly coming to recognize the contradiction for the “democratic creed” that racial discrimination entailed, according to Myrdal, and a positive resolution of this “moral dilemma” could soon be expected. As for Bunche’s views, they were less reflected in this conclusion than they were in his own short book, A World View of Race (1936), which suggests a more deeply rooted material basis for racial inequality (Henry 1995).

While Bunche continued to break racial barriers—for example, becoming the first black president of the American Political Science Association in 1954—he grew more race conscious. He shared the stage with Martin Luther King Jr. (1929–1968) in 1963 March on Washington, and he shared King’s reservations about the progress made and to be expected in American race relations. Ironically, the complexity of his thought and beliefs on this and many social issues was largely obscured by his success in world affairs. Still, given the breadth of his political views, he could not escape the intrusive attention of the Senate Judiciary Subcommittee on Internal Security in the heat of Washington’s anticommunist hysteria. He was interrogated in 1953 about his presumed association with black communists and communist sympathizers. In particular, his 1930s organizing role in the National Negro Congress was targeted. An FBI initiative to charge him with perjury for denying membership in the Communist Party fell through because it was built on a misunderstanding of his civil rights politics.

In 1904, when Bunche was born, the United States was an isolationist country internationally that further isolated African Americans internally from access to society’s resources. When he died in 1971, the United States was internationally engaged and interracially progressing, and he, far more than most leaders, had helped to make the changes possible.

**BURAKU OR BURAKUMIN**

The buraku people, or burakumin (literally, “village people”), are a group of approximately three million ethnic Japanese that is discriminated against by the majority Japanese population. This discrimination manifests itself in higher illness rates and higher unemployment than for mainstream Japanese, lower wages for the same jobs, the existence of illegal blacklists that corporations buy and use to avoid hiring buraku people, the discouragement of
marriage between burakumin and non-burakumin Japanese, and the historic complicity of Japanese religious bodies in segregating temples and bestowing prejudicial death names (kamiyō). From the 1990s to 2006, the Internet has been used to post defamatory statements against the buraku.

The discrimination ostensibly is based on historic, familial occupations that were deemed “unclean” by Japanese religions (Buddhism and Shinto), such as butchery, tanning, and leatherwork; however, in modern Japan, although descent is an operative factor, the primary determinant of buraku identity is location, as many buraku people live in designated government-supported housing and support areas (dōwa chiku). Today, an emergent issue is the question of what constitutes buraku identity: some residents of dōwa chiku claim ancestral buraku lineages, and others are socially defined as buraku people simply because they live in areas designated for burakumin.

There is scholarly debate as to the historical origin of buraku discrimination. During the Heian period (794–1185) the lowest in society (semmin, as opposed to the ryomin, the “good”) often handled leather armor for warlords (datimyo), and in return they usually were provided with some tax relief and poor land. They were also given “unclean” jobs such as jailer and executioner, and were expected to be the first line of defense in case of attack. Some scholars conjecture that this social segmentation was the beginning of what came to be the buraku designation; however, it was distinctly in the Tokugawa period (1603–1867) when the discriminatory policies and structure were established in a stratified social order (samurai, farmer, artisan, and merchant) that excluded the eta and the hinin. (These discriminatory terms, which respectively mean “much filth” and “nonhuman,” were used as social designations at the time.) The ostracized eta and hinin groups are considered the precursors of today’s burakumin. In 1871 discrimination against this subgroup was abolished by the Emancipation Edict (Eta Kaibō Rei), but the edict had little effect on bettering conditions.

In March 1922 the National Levelers Association (Zenkoku Suiheisha) was founded to address the persistent discrimination against the buraku people. With the rise of the Japanese military establishment, the organization was outlawed in 1937, then reinstated itself in 1946 as the National Committee for Buraku Liberation (then the Buraku Liberation League in 1955). In 1969, through sustained political activism by the buraku organizations and their supporters, the Japanese government enacted special legislation (Laws on Special Measures for Dowa Region) that dramatically bettered conditions for the buraku people. It remains to be seen how the expiration of this legislation in 2003 will continue to affect the buraku community and the notable advances they have made in such areas as education, housing, and employment. While living conditions have improved and exogamous marriage increases, the major issue for the buraku liberation effort—as with many human rights efforts across the globe—is how to sustain the energy and communal effort to improve the majority Japanese attitude toward the buraku people into the next generation.

BUREAUCRACY
History discloses political orders different from each other. These orders evolve as a result of each society’s self-organization toward representative structures that confer validity on its rules and continuity. It was German sociologist Max Weber’s insight that these structures rely on systems of authority, such that every system attempts to establish and cultivate the belief in its legitimacy, as the grounds of authority, for which he found three pure types: charisma, tradition, and instrumental reason.

Bureaucracy, a term that literally means government by offices or agencies with prescribed functions, exemplified for Weber the organizational structure associated with legitimacy grounded in instrumental reason. He devoted considerable attention to bureaucracy in part because he believed that, despite exhibiting no unilinear development or progress, history had demonstrated a trend toward
increasing rationalization, or what he referred to as a “disenchantment,” so that bureaucracy represents in organizational structure a deeper cultural tendency, especially in the West. In order to grapple with increasing rationalization, he had to understand what it meant for the ordering of society.

Bureaucracy has a distinct character, which Weber delineated. Individuals with documented qualifications fill positions circumscribed by rules, in order to ensure the perpetual fulfillment of the bureau’s function. These rules tend to be stable and exhaustive. The resulting structure trends toward hierarchy. Incumbents are expected to keep their work separate from their private lives, so they can concentrate on their duties, which are based more on the processing of documents or files in the abstract and not on interactions with individual persons directly. Consistent with this tendency toward abstraction, the official is then rewarded abstractly by means of job security and a salary in a money economy, thereby making this career a distinct profession.

James Burnham examined the significance of bureaucratic administration as a profession in *The Managerial Revolution*, published in 1941. Burnham worried as a disillusioned leftist that the managerial revolution would derail the transition from capitalism to socialism. His work influenced the British futuristic novelist George Orwell, author of *Animal Farm* (1944) and *1984* (1949). It also inspired social scientists to conduct empirical studies of his primary thesis, and even in the 2000s Burnham’s book “occupies a prominent place in postindustrial theories of society” (Demers and Merskin 2000, p. 105). Burnham foresaw the rise of a new ruling elite composed of managers with organizational skill and technical knowledge. These managers were going to displace owners and capitalists in day-to-day operations. The research conducted since tends to bear him out.

The economist John Kenneth Galbraith extended Burnham’s argument in *The New Industrial State* (1967), noting that managers as a ruling elite had given way to a group even more embedded in the staff of bureaucracy, a group named by Galbraith as the technostructure. Due to increasing complexity, decision making in bureaucracy requires the specialized scientific and technical knowledge, talent, and experience of multiple persons exchanging and testing information. In this group, one might include engineers, accountants, and lawyers. Without the requisite mastery and information, managers must rely on the resulting apparatus for group decision. Although the apparatus known as the technostructure puts a check on individual initiative and ambition, taken as a whole it works toward its collective survival, autonomy, and growth, in that order. For Galbraith, the technostructure is the decision-making apparatus emblematic of bureaucracy. Seventeen years later, Galbraith saw no reason to amend these findings, except to emphasize the technostructure’s “deteriorative tendencies” (1988, p. 375).

At one time, scholars such as Ludwig von Mises might have wanted to isolate bureaucracy as a phenomenon that thrives only in the public sector, in government, but the evidence suggests that it is precisely in the technostructure described by Galbraith that the public and private sectors intertwine to share an overlapping fate, as large firms in the private sector attempt to manage their environment and as the government increasingly executes the laws by means of the technostructure within private firms. According to Galbraith, bureaucracy has emerged in every sector.

Bureaucracy not only has a distinct character, it also plays a distinct role in the routinization of charisma, the ordering of society into a rational form. Bureaucracy exerts pressure to domesticate creativity and genius, removing the element of mystification that accompanies charisma, in order to bring it into service without allowing it to supplant instrumental reason as the legitimating ground for authority. Bureaucracy thereby tends to channel or frustrate freedom, with astonishing success, which is why Weber famously lamented the “iron cage” that rationalization was building throughout society.

In the second chapter of *Images of Organization* (1986), Gareth Morgan echoed Weber by associating bureaucracy with an image of organizations that would be construed as mechanistic, structures invented and developed to perform a goal-oriented activity. Not surprisingly, with the mechanization of the Industrial Revolution came the widespread mechanization of organizational structures. Writers such as Frederick Taylor then made the process conscious, offering a scientific approach to managing organizations, on the principle that mechanistic thinking had succeeded in so many other aspects of life. And it had.

Bureaucracy contributes to the goal-oriented activities of any organization. Weber listed these advantages: “[p]recision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, reduction of friction and of material and personal costs….” (1958, p. 214). In contradistinction to previous structures, bureaucracy exists to remove less predictable elements such as individual favor from the conduct of business. This means it offers stability to a regime. Disputes are more easily resolved by appeals to reason and rules, which guide officials in their work. Bureaucracy also fits many purposes of large-scale government especially, where other bases of legitimacy have been outlawed or discredited. Since the Enlightenment, Western culture especially has preferred legitimacy based on instrumental reason.
Despite its promise of efficacy, bureaucracy meets with considerable resistance, especially from two sources. One source of resistance has been the concern previously expressed already by Max Weber that bureaucracy inhibits freedom and all that freedom promises. Ralph Hummel sharpened the critique in The Bureaucratic Experience (1994): Over time, given its prevalence and power, bureaucracy shapes human psychology, language, and culture, transforming what it means to be human in exchange for values including security and efficiency. Critics such as Orwell, Franz Kafka, Aldous Huxley, and in cinema Terry Gilliam (e.g., Brazil, 1985) have depicted an implicit terror and malaise in bureaucratic regimes that can only be described as inhuman. In his 1995 book Kinds of Power, for example, psychologist James Hillman cited the predatory practices of bureaucratic fascism and communism as the logical extension of the Enlightenment's emphasis on instrumental reason.

The resistance to bureaucracy from this source emphasizes the trade-off that comes with empowering an elite of professionals at the expense of democratic participation in the decisions that affect our lives, since bureaucrats are not supposed to be directly responsive to voters, to markets, or even to beneficiaries of the services provided by that bureau. Weber noted that bureaucracy accompanies the rise of mass democracy, in that it promises status only in exchange for meritorious service and not kinship, for example, or race, yet bureaucracy by no means enhances the power of the people to govern themselves directly.

Principles of diversity challenge the basis for choosing officials as somehow biased in favor of certain privileged social groups who acquire credentials disproportionate to their numbers in the population.

The second source of resistance to bureaucracy derives from the claim that there are more effective ways for organizations to work, since bureaucracy has a number of limitations. For instance, bureaucracy tends to hide its work from scrutiny, even from one bureau to another, whereas in an information age secrets impede innovation and cast doubt on a bureaucracy’s legitimacy. Bureaucracy also offers persistence at times that organizational structures should adapt to changing circumstances. The bureaucrat’s loyalty to the bureau might displace his or her loyalty to the bureau’s originating purpose; accusations leveled at fascist administrators who were “only doing their jobs” have been especially vivid.

Since the 1970s, organizational theorists such as Gifford and Elizabeth Pinchot have called for flattened hierarchies, cross-functional coordination, greater transparency, and shorter timelines than a conscientious bureaucracy can meet. These theorists borrow principles from the marketplace, urging bureaucracies to cultivate a more entrepreneurial spirit, taking risk and competing. Theorists also notice the power of flexible networks, rather than rigid silos. Writing in 1999, Richard Brinkman uncovered as evidence of bureaucracy’s weakening hold the tendency of management to pursue short-term profit in part by downsizing elements of the technostructure, yet it can be said that reports of bureaucracy’s demise are greatly exaggerated.

BUREAUCRAT

The term bureaucrat refers to a professional administrator, a career official employed to serve a bureau or office. Often used pejoratively, the term describes a predominantly stabilizing function in which the career interests of the administrator align with the bureau’s norms and values. The German sociologist Max Weber (1864–1920) embedded in his classic analysis of bureaucracy in Economy and Society (originally published in 1925 and translated in 1958) a section on the position of the official whose activities are fixed and ordered by rules, so that authority will be seen to derive from a rational and impersonal basis. For Weber, the bureaucrat is simply intrinsic to this process of rationalization that so typifies moder-
nity. Such an official would have been expected to possess certain qualifications in order to occupy the position in the first place, presumably as a result of rigorous training in management generally and in the rules of the bureau. At all times, official activities are supervised by a higher authority within the organization; nevertheless, the official owes loyalty not to the supervisor, but to the bureau and its purpose. A bureaucrat assumes appointment to the office by accepting “a specific obligation of faithful management in return for a secure existence” (Weber 1958, p. 199). As a result, the official is meant to enjoy a status commensurate with rank. An official’s expertise and authority will tend to protect the officeholder from “arbitrary dismissal or transfer” (Weber 1958, p. 202). Weber held that for the sake of stable employment the bureaucrat will accept a lower salary compared to the private sector, although presently bureaucrats appear in every sector, including the private sector—to the consternation of critics. One critic, James Burnham, famously warned in 1941 against their domination as a class.

According to the economist Ludwig von Mises in *Bureaucracy* (1944), allegiance to the bureau and relative insulation from “arbitrary dismissal or transfer” contributes to the perception that bureaucrats tend to be unresponsive to external complaint. The primary reason is that there exists no way to calculate the bureaucrat’s performance, except of the extent to which he or she adheres to the prescribed rules and stays within budget.

Bureaucrats stabilize the office in part because they learn not to take risks. Ralph Hummel explains in *The Bureaucratic Experience* that the supervisor assumes the role of conscience and ego function, deciding what needs to be done and how, and leaving it to the bureaucrat to fulfill the explicit terms of the employment contract. Any other than instrumental rationality is not required. Mises spoke for many critics when he argued that bureaucracy “kills ambition, destroys initiative and the incentive to do more than the minimum required” (Mises 1983, p. 61). Rather than undertake risk, a prudent bureaucrat will not only conform but also take steps to secure the future by protecting the bureau from threat of dissolution. For this reason, whatever the originating and legitimating purpose had been for the creation of the bureau, the bureaucrat owes a primary allegiance to the perpetuation of the bureau itself. Keeping a job becomes more important than doing the job, which is goal displacement. For example, in 1978 the communist Rudolf Bahro identified bureaucrats in socialist states as jealous and exploitative rulers, responsible for alienated consciousness and preventing further liberation.

The virtue of bureaucrats, according to Gareth Morgan (1986), lies in professionalism based on expertise, concentration, a relatively transparent mission, and the impersonal nature of workplace relationships—all of which fulfilled the ambition of rational administration consistent with a mechanistic model of organizations, in contrast to prior models based for example on kinship, personal loyalty, or profit seeking.

**BURIAL GROUNDS**

A burial ground is a place of interment. It is a tract of land, a yard, or an enclosure for the subterranean deposition of human remains. Often the objects of legend, burial grounds have varied throughout time according to the cultural practices and religious beliefs of different peoples. Whereas Aubrey Cannon (1989) maintains that human expressions of death in burial grounds follow a general cross-cultural pattern that cycles between elitism and emulation, James Deetz (1996) suggests that burial grounds showcase culturally specific symbols that are evident in every aspect of a given society’s lifeways.

The first hominids to bury their dead were probably Neanderthals that lived between 20,000 and 75,000 years ago. In fact, many Neanderthal interments exhibited evidence of burial customs that are still practiced, including the placement of flowers and other grave goods with the deceased and the orientation of the dead along an east-west axis. Group interments in large earthen mounds, also called *tumuli, kofun, barrows,* or *kurgans* in different cultural contexts, became common across Europe, Asia, and the Americas in the centuries before and after 1 BCE. Gigantic stone temples that housed burial chambers also occurred across the globe during this time. These mammoth structures included Egyptian and Mayan pyramids and ancient Greek necropolises.

In the centuries leading up to the 1700s, Westerners buried their dead in sacrosanct churchyards according to
specific spatial norms that tied directly to their faith in resurrection. Wealthy individuals were interred within the church itself and on the east side in order to get the most direct view of the rising sun on Judgment Day, the poor were laid to rest to the south of the church, and the north churchyard was reserved for stillborns, bastards, and individuals who committed suicide. Even though these shallow churchyards often teemed with bones, scavengers, and maggots, they were still a center of social activity and frequently hosted markets, gaming events, and other gatherings. It was not until the late 1600s that the English Parliament linked these unsanitary practices with the spread of the plague and outlawed shallow graves, large funerals, and unnecessary burial-ground activities. A chronic shortage of space in churchyards in the 1700s forced a change to burial strategies. The north side of the church was no longer for social outcasts, all of the deceased were packed closer together, and numerous coffins were stacked on top of one another under the top-soil, leading many churchyards to tower a dozen feet or more above the floor of the church.

Just as the stone walls surrounding many European churchyards began to collapse under the pressure of the overcrowded burial ground, Parisian officials enacted a drastically different interment policy, transporting the bones of millions of deceased individuals into catacombs beneath the French capital. This initial act of the eighteenth-century cemetery reform movement also led to the creation of the first garden cemetery—the Père-Lachaise—which spanned hundreds of acres in an uninterrupted picturesque landscape that was far away from the church and the crowded urban city center. Père-Lachaise was the first municipal cemetery, as the government now controlled burial procedures and planning instead of the church. Others quickly followed suit; Boston’s Mount Auburn Cemetery, established in 1831, was the inaugural cemetery in the Western hemisphere to embrace this change in burial-ground planning, and it set the standard for large rural garden cemeteries in the United States that persists into the present day.

**BURIAL GROUNDS, AFRICAN**

The final resting places of enslaved and free people of African descent have been examined in diverse contexts throughout the New World. Ranging from late sixteenth-century Mexico to postemancipation Arkansas, these sites reflect the range and complexity of the African diasporic experience. Although many of these sites were examined within a historical forensic paradigm, the greater involvement of African Americans as both clients and producers of burial ground studies is fostering a historically and culturally grounded biocultural approach that is more responsive to the needs and interests of the descendant communities (Blakey 2001; Epperson 1999).

In 2000 construction activity in the city of Campeche on Mexico’s Yucatan peninsula resulted in discovery of the foundation of an early cathedral and an associated multiethnic burial ground that was used from the mid-sixteenth century until the construction of a new cathedral in the late seventeenth century. Some 180 individuals were interred at this site, including at least 10 of African ancestry. The presence of dental modifications, in conjunction with strontium isotopic analysis, indicates that at least four of these individuals were born in West Africa. Although there is ample documentary evidence of African slavery in the Campeche region during this period, it should not necessarily be assumed that these individuals were enslaved (Handler and Lange 2006).

At the site of the Newton Plantation in southern Barbados the remains of 104 African-descent individuals interred between 1660 and 1820 have been analyzed. Of particular interest is Burial 72, a male about fifty years old who was buried during the late 1600s or early 1700s with a distinctive assemblage of grave goods suggestive of status as a healer/diviner (Handler 1997; Handler and Lange 1978). In a very different plantation context, investigation of the Bellevue Plantation near Charleston, South Carolina, included a sample of twenty-seven individuals who died between 1840 and 1870. These individuals had a high incidence of anemia and infection as well as skeletal changes associated with very demanding physical labor (Rathbun and Scarry 1991).

Excavations in the multiethnic St. Peter Street Cemetery in the French Quarter of New Orleans recovered remains of eighteen individuals, at least ten of whom were of African descent. This cemetery was in use as early as 1720 until the end of the eighteenth century. Within the African American burials, investigators noted the presence of Roman Catholic grave goods and suggested the presence of two occupational groups: house servants and laborers (Owsley et al. 1987).

The African Burial Ground in New York City was in use from the late seventeenth century until about 1795.
Excavations conducted in 1991–1992 recovered the remains of more than four hundred African-born and African American individuals. Analysis of these remains revealed evidence of the rigors of urban slavery as well as the survival and nurturance of West African cultural traditions. Pressure from the descendant community resulted in the development of a research design that placed greater emphasis on the historical and cultural context of the burial ground. The remains were reinterred on the site in 2003 (General Services Administration 2006; LaRoche and Blakey 1997).

Analysis of over 140 burials recovered from the First African Baptist Church Cemetery (in use c. 1822–1848) in downtown Philadelphia, Pennsylvania, revealed that antebellum free African Americans shared many of the rigors of their enslaved kin, suffering high infant and childhood mortality, periodic malnutrition and infectious diseases, and degenerative joint diseases (Angel et al. 1987; Rankin-Hill 1997). Similarly, the rural Cedar Grove Cemetery in southwest Arkansas provides stark evidence that the health of African Americans did not improve during the postemancipation period. Cortical bone analysis of a sample of fifteen females and fourteen males indicates a population that was under extraordinary disease and nutritional stress (Martin, Magennis, and Rose 1987).

BURIAL GROUNDS, NATIVE AMERICAN

In nearly every culture—and certainly in every religion—there is some promise of life after death. It is often necessary, therefore, to connect one’s mortal remains with after-existence, whether by freeing the soul from its worldly dwelling or preparing those remains for their later state. The meaning attributed to such preparations and the forms they take mirror much of the society they serve and often carry, through the intensity of their attendant emotions, the ideas upon which a culture depends when death threatens the very order of things.

The disposition of the dead by American Indians is as varied as the organization of the groups themselves. For many ancient peoples (c. 1000–200 BCE), as seen particularly in the eastern United States, elaborate burial mounds probably replicated the social order of settlements or the vision of the cosmos at large; for others, like the Choctaw, Plains Indians, or Northwest Coast tribes, the spirits of the dead could only be released by first exposing them to the elements, the scattered remains sometimes being subject to secondary interment; for still others, as among those groups of the Southeast, the dead were often placed in large earthenware jars before burial. As many Indians and Aleuts were converted to Christianity by Hispanics,
Europeans, or Russians, burial in cemeteries, with appropriate religious insignia, became far more common. To the extent that one can generalize, for Native Americans, locale and cosmos came together in the rituals of daily life, including, with special force, the treatment of the place with which the remains of one's predecessors were associated.

Just as white Americans will go to extravagant lengths to recover the bodies of their dead or visit their final resting place, so, too, for Native Americans, deprivation of their dead has been felt with special intensity. The forced removal of Indians from the East, the creation of reservations, and the loss of Indian lands exacerbated the sense of separation from ancestors. Throughout the Indian wars of the nineteenth century, the remains of fallen Indians were collected by the U.S. Army, the bodies stripped of their flesh, and the bones sent back to Washington, D.C. Housed for decades in government and private institutions, thousands of skulls and bones were hidden away or subjected to every passing scientific notion—from the relation of cranial size to intelligence, to the development of civilization as determined by denture, diet, or DNA. Often, too, the remains were placed on view in public or private museums, commonly with unflattering labels or surroundings. To Indians, these collections and exhibits, whether for science or for profit, were nothing short of the desecration to which, they argued, non-Indian remains were never subjected.

Many of these issues came to a head in the 1970s and 1980s, when Indian legal groups filed lawsuits seeking the discontinuance of offensive displays and the return of Indian remains. There was, however, no clear legal right to the return of such remains—whether the 18,500 sets of remains in the Smithsonian Institution or the hundreds of skeletons plundered in the late 1980s from a site in Kentucky. In 1990, therefore, the U.S. Congress passed the Native American Graves Protection and Repatriation Act (NAGPRA), which explicitly classifies human remains as “cultural items” that could be returned to related successor tribes. As museum and university inventories were constructed and tribes asserted the right of return, archaeologists and native groups sometimes came into conflict: Most native peoples object to any scientific studies of their ancestors’ remains, while scholars often asserted the benefits of allowing their studies to go forward. A number of states (e.g., California) also passed statutes or entered into agreements with tribes allowing the return of burial remains even from private sites. Further federal protection criminalizing the illegal excavation or trafficking in human remains is afforded by the Archaeological Resources Protection Act of 1978. Tribes themselves have also adopted codes affecting archaeological work on their reservations, and have even sought to make their laws extend to remains housed off Indian lands. Several international human rights conventions have proved an effective basis for the return of remains to peoples of the South Pacific, but since the United States is not a signatory to some of these treaties, international standards have yet to be applied to Native Americans.

Perhaps most difficult has been the question of ancient remains. When a set of 8,000- to 9,000-year-old bones, known as Kennewick Man, was discovered in Washington State, the Army Corps of Engineers sought to transfer the bones to the five tribes who claimed a connection to them. In 2004 the Ninth Circuit Court of Appeals (in Bonnichsen v. United States) held that the requirement that there be some relation of the remains to an existing tribe, people, or culture had not been met in this case, and the court permitted scientists to gain access to the materials. Other cases may also test the meaning of indigenous and the criteria for showing cultural affiliation, terms that are not clearly defined in the statutes themselves. Nevertheless, where historical connections can be asserted, the capacity of tribes to regain control over their people’s burial remains has significantly increased since the 1980s.

Americans have long had a deep-seated ambivalence toward their native peoples. From the restraints that Chief Justice John Marshall (1755–1835) sought to place on the federal government’s care of its “domestic dependent nations” to the willingness of white Americans who would never adopt a black child to extend their kinship boundaries to include Indians, the course of American history has never been a simple story of conquest and oppression. The question of science versus heritage, identity versus property, replicates much of white-Indian relations and the ambivalence with which each approaches the actions and intentions of the other. The idea that Indians are like the miner’s canary—that they give an early indication of the quality of the environs in which everyone operates—is no less true where archaeological remains are concerned than where land, natural resources, or the constitutional limits of indigenous sovereignty are also at issue.

BURKE, EDMUND
1729–1797

Edmund Burke was an Irish Protestant author and member of the British House of Commons. Burke's legacy rests on his profoundness as a political thinker, while his relevance to the social sciences lies in his antirevolutionary tract of 1790, *Reflections on the Revolution in France*, for which he is considered the founder of conservatism.

Born in Dublin to a Protestant father and Catholic mother, Burke was raised as an Anglican and received his education at a Quaker school and Trinity College. Rejecting a career in law, Burke wrote a treatise on aesthetics, *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757), and edited the political review *Annual Register*. Burke's talents as an intellectual attracted the attention of a politically powerful patron, the marquis of Rockingham, for whom Burke worked as private secretary and to whom Burke owed his entry into Parliament.

As a member of Parliament from 1765 to 1794, Burke employed his oratorical skills and propensity to connect legislative policy to political philosophy in the interests of the Whig party. Foremost among his causes was the mitigation of harsh penal laws in Ireland. Although a steadfast member of the Anglican Church, Burke's experience in Ireland and his Catholic connections made him deplore the discrimination against Irish Catholics. Burke also urged reconciliation with American colonists, opposing the Stamp Act of 1765 as bad policy even as he defended the theoretical right of Parliament to tax. Throughout his career Burke condemned the East India Company's mismanagement, calling after 1782 for parliamentary control of that body and for the impeachment of Bengal's governor-general, Warren Hastings. In addition, Burke's position in the opposition led to repeated cries for "economical reform," or a diminution in the power of the Crown by limiting the number of government employees who sat in Parliament. Finally, Burke contributed to British constitutional theory in important ways: He defended the formation of political parties, defined as "bod[ies] of men united for promoting by their joint endeavours the national interest" (Ayling 1988, p. 48); and he insisted that in Parliament he represented the common good rather than simply the interests of his Bristol electors.

Burke's *Reflections on the Revolution in France* offered a conservative interpretation of Britain's Glorious Revolution in 1688 and a condemnation of France's revolution in 1789. For Burke, the Whig-led Glorious Revolution merely protected civil liberties and Protestantism by overthrowing the tyrannical and popish James II; it did not usher in an era of natural rights, democratic politics, and the separation of church and state. As such, 1688 constituted a restoration of British liberties under the protection of strong institutions, notably the Church of England and a constitution balanced between a hereditary monarchy and a governing class of landed aristocrats.

Burke exorciated the French Revolution for its radical destruction of the past. Considering society a complex historical development—"a partnership not only between those who are living, but between those who are dead, and those who are to be born" (Burke 1987, p. 85)—he rejected contemporary theories of the social contract. Convinced of the limitations of human reason, he mocked the revolutionaries' reconstruction of the polity on abstract philosophical principles as a chimerical "new conquering empire of light and reason." Viewing rights and liberties as historical patrimony (for example, English liberties founded in the Magna Carta), he recoiled at the notion of universal human rights enshrined in the French Declaration of the Rights of Man and Citizen. Reckoning "the restraints upon men" to be among their rights, Burke found such restraints in religion and the establishment of a state church that sanctified the social and political order. Unmoved by paeans to equality, he insisted that "the natural order of things" entitled men of ability and property to govern. In sum, Burke saw the French Revolution as a rejection of the handiwork of God as expressed in the slow development of institutions in history.

Standing at the threshold of a new age of democratic politics, Burke exclaimed: "I put my foot in the tracks of our forefathers, where I can neither wander nor stumble" (Burke 1889). Although such reverence for the past might justifiably merit Burke the title "founder of conservatism," several points are in order. First, *conservative* is not synonymous with reactionary; Burke was no arch-conservative enslaved by the status quo, as evidenced by his advocacy of issues ranging from Catholic relief to the abolition of the slave trade. His guiding principle was conservatism and correction, by which he meant that reform was necessary to preserve institutions. Second, Burke's conservatism was British (or "Anglo-American"); in rejecting the French Revolution, he sought to conserve what he considered the liberal and modern order in eighteenth-century Britain. Subsequent thinkers have employed Burke’s sus-
picion of reason; his respect for the past; his insistence on religion and property as the foundations of society; and his antipathy to democracy in order to defend absolute monarchy, a hereditary nobility, and religious discrimination—but their doing so only serves as a reminder of the differences between what and why Burke wrote and how he was read.

Burr, Aaron
1756–1836

Grandson of Jonathan Edwards and son of the second president of the College of New Jersey (Princeton), Aaron Burr seemingly showed great promise. He sided with the revolutionary cause and served with courage and skill in various campaigns. The real leadership skills he displayed, however, were overshadowed by George Washington's (and Alexander Hamilton's) distrust, which somehow Burr earned in his first contacts with Washington. After the American Revolution he began a career in law and quickly became immersed in politics. His political views, to the extent that they are known, tended toward radical republicanism. Burr was a vigorous opponent of slavery early in his career, and he supported expanding the rights of women. But his enlightened views were tarnished by his ambition and political opportunism. He was elected to the Senate in 1791, where he served one undistinguished term. He was included on the Republican ticket in 1800 in order to secure a victory in New York, where he had created an effective political machine. The outcome of the election plunged the nation into crisis because Burr received the same number of electoral votes as Jefferson. Rather than step aside, as might have been expected from someone who was almost universally held to be the vice-presidential candidate, Burr forced the election into the House of Representatives. Jefferson was eventually victorious in the House, but by then his suspicions of Burr had hardened into hatred and for the next four years he simply ignored his vice president. Burr did preside with competence and fairness over the Senate, including the impeachment trial of Supreme Court Justice Samuel Chase.

Hamilton had thrown his political weight behind Jefferson in the struggle of 1800. Again in 1804 Hamilton worked actively to thwart Burr's campaign to become governor of New York. Burr had had enough. He and Hamilton met on the dueling field on July 11, 1804. Hamilton's death at Burr's hands was the death knell for Burr's conventional political career. He then embarked on the unconventional political career in the American Southwest that would see him charged with treason. The goals of Burr's extensive and well-documented efforts to put together a private military force remain unclear. Did he mean to dismember the Union? Or did he mean only to subvert Spain's empire? Were his goals in some way republican? Or would he have preferred to become the Napoléon of the Southwest? Would he have liberated slaves in the territories he conquered? Was he indifferent among these alternatives?

Significant doubts remain regarding the answers to all of these questions. Burr's own most unequivocal statement as to his intentions came late in his life when, after the Battle of San Jacinto paved the way for an independent Texas, he is said to have remarked, "I was only thirty years too soon. What was treason in me thirty years ago is patriotism today." Whatever the case, rumors of Burr's plans swept the country and, after a period of inaction, Jefferson pursued Burr ruthlessly. He had Burr captured and charged with the capital offense of treason. A spectacular and controversial trial followed. Chief Justice John Marshall strictly construed the constitutional provisions on treason. Only an "overt act" of "levying war" against the United States witnessed by two persons could amount to treason. The jury found that Burr's various plans and meetings fell short of this standard and rendered a verdict of not guilty. After the trial Burr left for Europe, where he spent four years and continued to seek support for his southern scheme.

The rest of Burr's life was sad and uneventful. Burr had admirers such as Andrew Jackson, and impressive figures such as Marshall and John Jay did not view Burr with the same hostility as did Jefferson and Hamilton. Yet it is hard not to conclude that Burr was an anomaly in his generation. When many Americans thought they were walking with history, Burr seemed strangely detached from the
great republican experiment that was going on around him. This is perhaps one key reason why his life is full of extraordinary episodes but his lasting contributions are negligible.

BUSH, GEORGE H. W.
1924–

When George Herbert Walker Bush became the forty-first president of the United States on January 20, 1989, he entered the Oval Office as one of the most experienced political figures to become president in modern times. He had just completed eight years as Ronald Reagan’s vice president, and before that he served as U.S. ambassador to the United Nations and to China, had headed both the Central Intelligence Agency and the Republican National Committee, and had been a member of the U.S. House of Representatives from Texas. When he left the White House four years later, Bush’s presidency seemed far more successful in terms of foreign policy than in economic policy.

Bush, born into one of the United States’ most influential families, graduated Phi Beta Kappa from Yale University after flying fifty-eight missions as a naval aviator during World War II (1939–1945). After graduation Bush moved to Texas to enter the oil business and, eventually, Republican politics. He first ran for president as a Republican moderate in 1980 and became Ronald Reagan’s running mate despite criticizing Reagan’s fiscal policies as “voodoo economics.” Despite Reagan’s reliance on Bush throughout the 1980s, the vice president became the 1988 G.O.P. nominee only after defeating several more conservative rivals. Bush then defeated Democrat Michael Dukakis of Massachusetts in a tough campaign waged over prison furloughs and flag burning and marked by Bush’s vow: “Read my lips: no new taxes.”

As president, Bush pursued a centrist course legislatively, winning support from Democratic majorities in Congress for social programs such as the Americans with Disabilities Act and the 1990 Clean Air Act. As the federal budget deficit expanded, Bush agreed in 1990 to tax increases that he previously had vowed to oppose.

Bush’s four years as president were marked by many foreign policy challenges, most notably the collapse of communist governments across Eastern Europe and the dissolution of the Soviet Union itself. Bush’s diplomatic negotiating secured reductions in superpower nuclear arsenals, a peaceful end to the cold war, the reunification of Germany, and the development of democratic nation-states in areas that had been under Soviet control for decades. Bush had less success in handling China, which brutally crushed prodemocracy demonstrators in Tiananmen Square in 1989, killing or injuring thousands. When Iraqi president Saddam Hussein invaded Kuwait in August 1990, the diplomatically oriented president built an international coalition that dislodged the dictator from Kuwait.

Bush’s 89 percent approval rating after the first Gulf War in early 1991 deterred many prominent Democrats from running for president in 1992. The eventual Democratic nominee, Arkansas governor Bill Clinton, focused on public anxieties over the state of jobs under Bush. Ross Perot, an independent presidential candidate, also attacked Bush’s economic policies, saying the president’s policies would trigger “a giant sucking sound” as U.S. jobs moved to Mexico. Voters did focus on the economy, not on Bush’s foreign policy performance. In addition, some Republicans were angered by what they viewed as Bush’s broken promise on taxes. In the end, Clinton received 43 percent of the vote, Bush received 38 percent, and Perot received 19 percent.

BIBLIOGRAPHY
George Walker Bush, the forty-third president of the United States, presided over the country during the September 11, 2001, terrorist attacks and led the nation in the resulting overthrow of the Taliban regime in Afghanistan and the invasion and occupation of Iraq.

The son of George H. W. Bush, the forty-first president of the United States, George W. was born in New Haven, Connecticut, in 1946 and grew up in Texas before attending the Phillips Academy prep school in Andover, Massachusetts. In 1968 Bush earned a bachelor’s degree from Yale University, his father’s alma mater. After serving in the Texas Air National Guard, Bush received a Masters of Business Administration degree from Harvard Business School in 1975 and moved to Texas, where he was an executive in a series of oil-exploration ventures. He also ran unsuccessfully for the U.S. House of Representatives in 1978.

In 1989 Bush bought a stake in the Texas Rangers baseball team and became the managing general partner of the team. The public visibility of this position helped him secure the Republican nomination in the 1994 Texas race for governor. He subsequently defeated the incumbent Democrat, Ann Richards, in the general election.

After being reelected as governor in 1998 by a wide margin, Bush became the leading Republican contender for the U.S. presidency. Fighting off a strong primary challenge from Senator John McCain of Arizona, Bush won the GOP nomination. During the 2000 campaign against Bill Clinton’s vice president, Al Gore, Bush carefully positioned himself as a “compassionate conservative,” who supported education reform, tax cuts, and private accounts in Social Security.

On election night Gore won the popular vote, but it appeared that Bush had won the Electoral College and thus the presidency. However, Gore’s aides discovered that Florida was essentially tied, and the vice president retracted the concession he had offered Bush. Gore’s campaign quickly requested hand recounts in several counties and the election shifted into a legal battle. The Florida Supreme Court issued a decision allowing the results of such recounts to be incorporated into statewide vote totals, but the U.S. Supreme Court halted the recounts in a controversial 5 to 4 decision. With Bush still ahead in the official state count, the election was over. Bush and his father became the second father and son to both serve as president, following John Adams and John Quincy Adams.

Some observers expected Bush to govern as a centrist and seek bipartisan cooperation in response to the circumstances of his election. Instead, Bush, a self-proclaimed conservative, pushed ahead with his campaign plan for a sizeable tax cut, which was passed into law by June 2001 with significant Democratic support.

Then on September 11 of that year, members of the Al-Qaeda terrorist organization struck the United States, flying jetliners into the World Trade Center in New York and the Pentagon in Washington, D.C., and crashing a fourth jet in a field in Pennsylvania. More than three thousand Americans were killed. After this national trauma, the public united behind Bush, pushing his approval ratings to unprecedented levels. Within months, U.S. air strikes helped the Northern Alliance overthrow the Taliban regime in Afghanistan, which had provided safe haven to Al-Qaeda’s leader Osama bin Laden and his followers. However, the United States failed to capture bin Laden.

In the fall of 2002 the Bush administration began to push for an invasion of Iraq, arguing that Iraq’s leader Saddam Hussein was an evil dictator who posed a grave threat to the United States due to his possession of weapons of mass destruction and links to Al-Qaeda. Bush and British Prime Minister Tony Blair secured a United Nations Security Council resolution calling on Saddam to disarm and submit to weapons inspections. Yet Saddam continued to resist the inspections, and in response the United States and the United Kingdom called for military action against Iraq. Independent observers and many foreign countries questioned the Bush administration’s claims about Saddam’s possession of weapons of mass destruction and ties to Al-Qaeda. The United States and the United Kingdom failed to secure a second United Nations resolution approving military action against Iraq, but decided to invade without it, beginning the attack on March 20, 2003. Saddam’s regime quickly fell with minimal casualties, and Saddam himself was captured on December 13.
The occupation of Iraq proved more difficult than anticipated. A governing regime was set up, and elections were held, but an insurgency composed of disaffected Iraqis and foreign jihadists became an increasingly deadly threat to coalition forces. By spring 2006, more than two thousand U.S. troops had died in Iraq, and a majority of Americans told pollsters that the war had been a mistake. In addition, convincing evidence that Saddam possessed weapons of mass destruction at the time of the invasion was never found, nor was hard evidence of operational links between Iraq and Al-Qaeda. Over time, Bush increasingly emphasized the cause of creating a democracy in Iraq, which had received relatively little attention before the war.

In the domestic arena, Bush passed several major initiatives after September 11, including the No Child Left Behind Act (which enacted a new accountability regime of school testing), a second tax cut, and a bill adding prescription-drug coverage to Medicare. In 2004 he defeated his Democratic opponent, Senator John Kerry, in a reelection campaign that emphasized security concerns and such social issues as gay marriage. Bush won 51 percent of the vote and 286 electoral votes in the narrowest presidential reelection victory since Woodrow Wilson in 1916.

The first major initiative of Bush's second term was an effort to create private investment accounts in Social Security, but his proposal failed to gain significant momentum in Congress. By spring 2006 Bush's approval ratings had plunged to less than 40 percent; conservative discontent with his presidency had grown; and calls for U.S. withdrawal from Iraq had begun to mount. However, Al-Qaeda had not successfully attacked the United States again and economic growth remained relatively strong.

BUSINESS

Business is a commercial activity engaged in as a means of livelihood or profit, or an entity that engages in such activities. The concept mainly applies to activities that are designed to supply commodities (goods and services). The term business pertains broadly to commercial, financial, and industrial activity. Business involves managing people to organize and maintain collective productivity toward accomplishing particular creative and productive goals, usually to generate revenue and profit. The etymology of the term refers to the state of being busy, in the context of the individual as well as the community or society. In other words, to be busy is to be doing a commercially viable and profitable activity.

Business is distinguished from households and government, the remaining economic actors in any economy. Households play a pivotal role as suppliers of resources and demanders of final products. Household consumption is the total expenditure by the household sector, which is financed by the sale of resources, mainly labor, in return for income. As society is deeply concerned, on normative grounds, with the equity of income distribution as well as with efficiency of production, the role of government is indispensable to a market economy. The market system generates a range of inefficiencies as a result of market failure (failure to produce goods and services efficiently, or failure to produce goods and services demanded), so ongoing regulatory and redistributive roles are defined for government in a market-driven economy.

PRIVATELY OWNED BUSINESS

The term business has at least three usages, depending on the scope of analysis: the aforementioned general usage; the singular usage to refer to a particular company or corporation; and the usage to refer to a particular market sector, such as agricultural business or the business community, that is, the aggregation of suppliers of goods and services. The singular business can be a legally recognized entity within a market-based society, wherein individuals are organized based on expertise and skills to bring about social and technological progress. In this case, the term business is associated with a corporation in which a number of shares are issued, and the firm is owned by shareholders who have limited liability. These corporations are legal entities. The businesses or corporations owned by the shareholders are treated by law as an artificial person.

The corporation becomes a legal entity through registration as a company and through compliance with company law. The owners of the company are issued shares in the company entitling them to any after-tax company profits in proportion to their share ownership. A major advantage of the corporation is that many individuals can pool their resources to generate the finances needed to initiate a business. An additional advantage is limited liability, meaning shareholders' liability for any losses is limited to the value of their shares. A final advantage of this form of organization is that the corporation
has a life as a legal entity, separate and apart from those of the owners. The company continues to exist even if ownership changes hands, and it can be taxed and sued as if it were a person. A corporation’s shareholders may not know anything about the actual production of the firm’s product, whereas the managers of the firm may not be concerned about the current state of the share market.

With some exceptions, such as cooperatives, nonprofit organizations, and government institutions, in predominantly capitalist economies, privately owned businesses are formed to earn profit and grow the personal wealth of their owners. In other words, the owners and operators of a business have as one of their main objectives the receipt or generation of a financial return in exchange for their work, that is, the expenditure of time, energy, and money. Private business is the foundation of the market capitalist economies.

GOVERNMENT-OWNED BUSINESS

Private business is in contrast to government ownership of business enterprises. Since ancient times, governments have owned and conducted many businesses, such as water systems, sports, theaters, mining, and public baths. In the United States, government units own and manage the public school system, public highways and bridges, dams, land, power, and many other businesses. The importance of public utilities to the community has frequently led to municipal ownership of water, sewerage, electricity, power, gas, and transportation systems. In Europe, where public ownership is more extensive and of longer duration than in the United States, it may include railroads, telephone, radio and television, coal mining, other power resources, and banking. Since World War II, many nations in Europe and North America have practiced public ownership of business through public corporations such as Amtrak. Many developing countries also have large-scale public ownership, especially of vital industries and resources. The distinct characteristic of a government-owned business is that its goal is to serve the wider community by offering services as efficiently as possible, but at the same time as inexpensively as possible. In other words, a government-owned business has a mandate to maximize social welfare, not make a profit, which is the goal of a private business.

Frequently it is argued that government ownership is necessary when private businesses fail to work effectively and fairly. Private businesses may fail to safeguard private property and enforce contracts, or collude to avoid competition. Certain industries may be most efficiently organized as private monopolies, but the market may allow such industries to charge prices higher than are socially optimal. Private businesses may not find it profitable to produce public goods. Prices set solely by the market often fail to reflect the costs or benefits imposed by externalities. Private businesses operating in markets can lead to an extremely unequal distribution of income. Finally, private business behavior does not guarantee full employment and price stability.

When private businesses yield socially undesirable results, governments may intervene to address these market failures. Government programs are designed to (1) promote full employment, price stability, balance of trade equilibrium, and sustainable economic growth in real gross domestic product (GDP); (2) promote competition; (3) regulate natural monopolies; (4) provide public goods and externalities; (5) discourage negative externalities and encourage positive externalities; (6) provide a more equitable distribution of income; and (7) protect private property and enforce contracts.

NONPROFITS

In contrast to a private business, a nonprofit business is a business that supports private or public interests for nonprofit purposes. Nonprofit organizations may be involved in numerous areas, most commonly relating to charities, education, religion, sports, arts, and music. Another class of business is the nongovernmental organization (NGO), an organization that is not directly part of the structure of any government. Many NGOs are also nonprofit organizations and may be funded by private donations, international organizations, or the government itself, or some combination of these. Some quasi-autonomous NGOs may even perform governmental functions. Many NGOs are key sources of information for governments on issues such as human rights abuses and environmental degradation.

COOPERATIVES

A cooperative is an autonomous association of people united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly owned and democratically controlled enterprise. Cooperative members usually believe in the ethical values of honesty, openness, social responsibility, and caring for others. Cooperatives are often seen as an ideal organizational form for proponents of a number of sociopolitical philosophies. A cooperative comprises a legal entity owned and democratically controlled by its members. Under this structure, ownership and control are exercised by all members of the cooperative in the form of group property. All members of the cooperative have equal rights to participate in the decision-making process. The fundamental characteristic of a cooperative is that it is democratically administered. The decision-making process in cooperative firms is based on the democratic principle of one vote per person, rather than one vote per share. This
is the standard the International Co-operative Alliance requires its members to embrace, and it is also the rule assumed in the theoretical literature.

In private business firms, management employs labor and has the ultimate decision-making power, whereas in cooperatives, labor employs management and ultimate decision-making power remains with the cooperative. In small cooperative firms the cooperative is able to carry out all managerial functions. However, as the size of the firm increases the complexity of organization also increases. Large cooperative firms need some delegation of authority; that is, the appointment of managers. Using their specialized skills, which are distinct from labor skills, managers assist in the formulation of decision-making by the collective; however, decision-making power still resides with the cooperative. Hence, managers are hired and dismissed by the cooperative. Whereas in private business firms managers are ultimately accountable to shareholders, in cooperatives managers are ultimately accountable to the collective.

The cooperative firm requires from its members loyalty, self-monitoring, solidarity, and commitment to the firm and to the ideas of cooperative management. As a result, cooperative firms do not need to dedicate so many resources to monitoring. Bowles and Gintis (1996, p. 320) and Doucouliagos (1995) argued that the proposition that cooperatives are inherently inefficient was not accurate. Participation in decision-making and productivity are positively related. Cooperatives can be as efficient as capitalist firms. Cooperatives do not suffer undue problems associated with investment, monitoring, and incentives, or face higher transaction costs, as assumed in the traditional literature. The dominance of capitalist firms in mature market economies and the relative scarcity of the cooperatives are independent of efficiency considerations. Institutional bias, credit rationing, path-dependent behavior, and the impact of the forces of conformity contribute to cooperative firms being outnumbered in mature market economies (Doucouliagos, 1995, pp. 1097–1098). In mature market economies the prevailing institutions, and not market oscillations, reinforce the duplication of capitalist firms. Therefore, cooperative firms must be considered an alternative to private property.

INTERNATIONAL BUSINESS
International business consists of business transactions (private and governmental) between parties from more than one country. (Daniels et al. 2004, p. 3). International business can differ from domestic business for a number of reasons, including the following: the countries involved may use different currencies, forcing at least one party to convert its currency into another; the legal systems of the countries may differ, forcing one or more parties to adjust their practices to comply with local laws; the cultures of the countries may differ, forcing each party to adjust its behavior to meet the expectations of the other; the availability of resources may differ among countries; and the way products are produced and the types of products produced may vary among countries.

The significance of business, and especially of international business, in the twenty-first century is largely determined by the following: globalization and economic integration; technological improvements in communications, information processing, and transportation; new organizational structures and restructuring processes adopted by companies in order to become more competitive and effective; the changing framework of international competition; and finally the deregulation of key sectors such as telecommunications, which led to the liberalization of capital flows among countries. The increase in international business was largely related to the sharp increase in investments and especially in foreign direct investments in the high-tech and telecommunication sectors in the advanced economies, and in the increase of mergers and acquisitions and cross-border transactions. In addition, developing and transition countries were increasingly liberalizing their economies, opening their borders, and abolishing barriers and obstacles in order to receive decisive foreign direct investment (FDI) flows. Increased FDI flow and international business is also supported by the abolition of monopolies, the elimination of tariffs and quotas, and by increased free-trade transactions as a complement to FDI flows (Bitzenis 2005, pp. 550–551).

E-BUSINESS
E-business (electronic business) is a term used when transactions for business purposes take place online on the World Wide Web. E-business, a name derived from such terms as e-mail and e-commerce, describes the conduct of business on the Internet, not only for buying and selling, but also for servicing customers and collaborating with business partners. In addition, companies are using the Web to buy inputs from other companies, to team up on sales promotions, and to initiate joint research. Companies are exploiting the cost saving, convenience, availability, and world-wide reach of the Internet to reach customers. Companies such as Amazon.com, originally only a bookseller, are diversifying into other areas and using the Internet profitably. The term e-commerce also describes business using the Internet, but e-business generally implies a presence on the Web. An e-business site may be extremely comprehensive and offer more than just products and services: some feature general search facilities or the ability to track shipments or have threaded discussions. IBM was among the first to use the term
Business Cycle, Empirical Literature

Business cycle researchers study the temporary deviation of macroeconomic variables from their underlying trend. During the nineteenth century, theories explaining business cycles were typically driven by real factors (as opposed to monetary factors), invariably of agricultural origin. Of course, given the relative size and importance of the agricultural sector at that time, these theories had some degree of success. However, as agriculture began to decline in importance, macroeconomists searched for other driving forces for the business cycle. Friedrich August von Hayek (1899–1992) suggested monetary policy, while John Maynard Keynes (1883–1946) surmised that business cycles were driven by a force he called “animal spirits,” with nontrivial roles for sticky prices and wages.

The 1970s saw the birth of the rational expectations approach to macroeconomics, coming mainly out of the new classical economics school of thought. In fact, the rational expectations revolution is often credited with returning real driving factors to the forefront of business cycle research. According to this school of thought, given that people are rational and can accurately forecast future events and the actions of policymakers, monetary and fiscal policies are likely to be ineffective in stimulating the economy (one could say that money is neutral in the former case of monetary policy, and that Ricardian equivalence holds in the latter case of fiscal policy). Additionally, in the absence of market frictions (all markets clear), an assumption held by new classical economists, sticky prices and wages are rendered nonfactors in causing macroeconomic variables to deviate from trend. Therefore, the following questions naturally arise. What are the sources of business cycle movement if people can correctly (or with a great degree of accuracy) anticipate the actions of policymakers? And given that the economy is perpetually self-adjusting so that all markets quickly return to equilibrium (no market friction), how do business cycles arise? That is, given the well-functioning macroeconomy proposed by the new classical school, what causes macrovariables to temporarily deviate from trend? The answer, according to new classical macroeconomists, is that observed cycles are driven by (unanticipated) shocks to real factors, specifically by supply-side factors that alter factor productivity and the capital-labor ratio. This led to the rebirth of real business cycle (RBC) theory with technology shock as its driving force, instead of agricultural factors as previously suggested.

In order to assess the applicability of the RBC theory, it should readily lend itself to empirical testing, as should any good economic theory. Economic theory, therefore, should be parsimonious while containing (enough) important features that, when estimated, the theory produces results that accord with the data, in some statistical sense. The RBC theory is no exception, and its success, hitherto, has been the ease with which it lends itself to estimation. To be clear, the purpose of RBC research, the narrow focus of this entry, is to investigate how much output variation or, more broadly, the degree to which cyclical fluctuations in key macroeconomic data over business cycle frequency, can be accounted for by technology shocks.

Calibration and regression methods are the commonly used techniques for empirically testing the RBC paradigm. Each technique, if properly applied, can be a useful tool in testing the merit of a particular model or in differentiating among various classes of models. Unfortunately, however, within the RBC framework, each tool can be subject to abuse by the researcher who wants to promote his or her own agenda at the expense of science. However, such blatant misuse of the empirical tools has been the exception rather than the rule, and the Cowles Commission (a research institute established in 1932 by businessman and economist Alfred Cowles, dedicated to linking economic theory to mathematics and statistics) should be proud to see both theory and estimation, of one form or another, appearing in more and more published articles. If only macroeconomists could agree on a particular theory or method!

BIBLIOGRAPHY

Aristidis Bitzenis
John Marangos
BUSINESS CYCLE FACTS
There are four facts that any RBC model should be able to capture (see, for example, Hansen and Wright 1992, p. 3, Tables 1 and 2), namely:

1. Investment is three times as volatile as output.
2. Consumption (nondurable goods) is less volatile than output.
3. Labor input is nearly as volatile as output.
4. Labor and productivity are essentially uncorrelated.

Another auxiliary feature of business cycles is that most variation in output, at business cycle frequency, is due to labor input. In addition, macroeconomic data exhibit a high degree of persistence over the cycle. Researchers invariably interpret the former as implying that movements in capital are unimportant at business cycle frequency and can thus be ignored when modeling business cycle fluctuations, whereas the latter points to the use of driving forces in our model economy that display some degree of persistence. The persistence of the driving forces will find its way into the model data via what is commonly called the transmission mechanism. (See Cogley and Nason [1995] for reasons why having the persistence in the data solely due to the driving process is a weakness rather than strength of the model.)

CALIBRATION
Made popular by Finn Kydland and Edward Prescott (1982), calibration is defined as the estimation of some parameters of a model, under the assumption that the model is correct, as a middle step in the study of other parameters. Thomas Cooley (1997) describes it as a strategy for finding numerical values for the parameters of artificial economic worlds. Basically, the researcher chooses values for certain parameters (the parameters that he has no interest in making economic predictions) and has the model spit out values for those parameters, left free in the exercise, for which he wants the model to make predictions.

Prescott in his 2004 Nobel Prize lecture lays out what a sound calibrating exercise of an RBC model would entail and closes by stressing the need for scientific discipline during the process by the researcher (see also Cooley 1997). Such discipline can generally be thought of as choosing the relevant parameter values based on sound microeconomic evidence and choosing functional forms for technology and preferences that display properties characteristic of the economy of interest. For example, Prescott (1986) chose his utility function based on the observation that per capita leisure displays no observable trend over time, and he used a Cobb-Douglas production function because of the constancy of capital share over the said period.

In an attempt to match the aforementioned business cycle facts, Prescott calibrates a baseline one-sector neoclassical growth model emphasizing technology shock as the main driving force behind cyclical fluctuations. He found that such a model was able to match not only the magnitude of output fluctuations but also the relative volatilities of both consumption and investment to output. The model failed, however, in its inability to match the facts pertaining to labor (facts three and four in the previous section). The ability of such a simple model, driven solely by technology shock, to match so many elements of the data is what led Kydland and Prescott (and others) in many of their papers, together and singly, to strongly advocate for technology shock and the RBC paradigm as being the impetus behind cyclical fluctuations in macroeconomic data.

An attractive feature of the calibration approach to estimation is its flexibility. A calibrated RBC model can be judged a success or failure depending on how many, and which, of the key business cycle facts it can capture. To be fair, one will scarcely find a model that is able to mimic all features of an economy—that is why it is a model. Therefore, economic researchers have to be prepared to judge a model as successful even though it fails on certain grounds—this is where calibration and calibrated RBC models fall short, since no goodness-of-fit statistic is provided with which to judge a model’s success. However, this too is where calibration has been unfairly criticized, since any unmatched moment can be considered essential depending on the reader. That said, calibration can prove useful in pointing out dimensions along which existing models can be improved. For example, to improve upon the baseline RBC model, Gary Hansen and Randall Wright (1992) incorporated additional shocks, specifically to fiscal policy, and other features to technology and preferences (for example, accounting for household production) that mainly affected the moments of labor market while leaving the other (successful) elements of the model economy intact. These modifications resulted in modified RBC models that came closer to mimicking the actual U.S. economy. However, Hansen and Wright did not promote one particular modification over another; they left that up to the reader.

There are advantages and disadvantages of calibration over its econometric counterpart. Promoters of calibration usually point to the selection of parameters based on microeconomic evidence as an indication of the strength of the exercise. They claim that more information can be incorporated into the calibration exercise (compared to the econometric approach), which allows the calibrated model to be held to higher standards. The second issue, alluded to
earlier, is the meaning of rejection or acceptance of a model based on statistics. A model that fits the data well along every dimension except one (unimportant) may be rejected based on some statistical test, or a model may fail to be rejected because the data is consistent with a wide range of possibilities (see Chari et al. 2005).

Those opposed to using calibration as an estimation device usually point to the extreme faith that one has to have in the model. Pure calibrators literally accept their model as truth. They also point to the fact that calibrated models are bad for forecasts (making predictions of the future), since they assume constancy of the selected parameters over time. Finally, calibration is only useful in times of structural stability, a point related to the lack of forecast ability.

REGRESSION METHODS
The most popular regression approach to the study of real business cycles and measures of technological innovation was developed by economist Robert Merton Solow (1956). The Solow approach measures inputs to capital and labor, and it labels as technology (more precisely, total factor productivity, or TFP) the difference between output and the measured inputs. In a more recent paper, Susanto Basu, John Fernald, and Miles Kimball (2004) modify the Solow approach by incorporating capital utilization and effort on the part of labor. They then measure technology shocks as the difference between output and measures of inputs, capital and labor, at both the extensive and intensive margins.

A more direct approach to the measure of technology shocks can be found in John Shea (1998). Shea uses estimates of research and development and patents to gauge technological changes over time.

More recently, macroeconomists have used the structural vector autoregressive (SVAR) approach to study the technology-driven RBC paradigm (see Gali 1999; Francis and Ramey 2005). Researchers using this method take key identifying assumptions from the theoretical model and impose them on the data. They then perturb the technology shocks identified this way and examine the responses of key macroeconomic variables to such perturbation. The responses are then compared to the business cycle facts in order to make a judgment about the plausibility of the RBC model in driving economic fluctuations.

Overall, the studies employing one or the other regression approach have not been good for the RBC model. These studies have failed to match the business cycle facts and have thus put into question the validity of the technology-driven RBC paradigm.

CONCLUSION
Other empirical RBC studies have brought to life the study of business cycles. The debates have centered on two important themes: (1) finding the correct empirical approach to use when studying this phenomenon; and (2) coming up with an answer to the question of what happens after a technology shock. As of 2006, there was no resolution for either of these problems, leaving room for clever young macroeconomists to shed new light and ideas on a long-standing subject at the heart of the work of many policymakers and academics.

BUSINESS CYCLES, POLITICAL

Understanding why the economy contracts and expands at regular intervals, commonly called a business cycle, has puzzled economists for centuries. One explanation, dubbed the political business cycle theory, posits that the economy shifts or cycles during presidential election years, or when power is transferred from president to president. Partisan varieties of political business cycle theories associate the political business cycle with the president’s political party. The opportunistic approach argues that the desire to be reelected drives the cycle without reference to political party affiliation.

POLITICAL BUSINESS CYCLE THEORIES

Michal Kalecki in Political Quarterly (1943) pioneered the idea that governments stimulate the economy prior to elections to garner constituency support and capitalists reverse the stimulus after elections. Kalecki hypothesized that capitalists were opposed to interventionist government spending to create full employment. Capitalists would therefore exploit their influence on politicians after elections creating a political business cycle. His idea was extended decades later by William Nordhaus in the Review of Economic Studies (1975). Nordhaus posited that as an election approaches, incumbents reduce unemployment by exploiting the short-run tradeoff between inflation and unemployment described by a Phillips curve. Once elected, the party in power follows a policy of austerity to reduce the inflation that was created earlier by the expansionary policy. The early “opportunistic” models predicted that output growth increases in the year-and-a-half before each election as incumbents stimulate economic growth to improve their chance of reelection. However, if the public is rational then it would be impossible for incumbents to systematically fool the public, and so more advanced models were developed.

In the second wave of these models Ken Rogoff and Anne Sibert, in the Review of Economic Studies (1988), demonstrated that opportunistic cycles can occur when voters are assumed to be rational, as long as individual leaders had private information about their competence; that is, the ability to provide government services at a low cost.

The second class of political business cycle models (termed partisan models) requires differences in policy objectives of political parties to be the impulse for the cycle. Left-wing governments stimulate the economy once elected whereas right-wing governments contract the economy due to ideological differences concerning aversion to higher inflation versus higher unemployment. In the most widely accepted specification adopted by Alberto Alesina in the Quarterly Journal of Economics (1987), only the unanticipated effects of monetary policy differences between the two parties can be a cause of the political business cycle.

These two approaches to understanding political business cycles generate the following important predictions. First, the partisan model predicts that left-wing governments expand while right-wing governments contract early to midyear through their terms. Second, according to the opportunistic model, presidents whose parties subsequently hold on to the presidency at the following election (either by reelection or another member of their party winning) will have expanding economies as the election approaches.

EVIDENCE ON POLITICAL BUSINESS CYCLES

Since World War II the real U.S. economy has grown more rapidly after every Democratic president has begun his term and has grown more slowly after every Republican president has begun his term, providing support for the partisan approach. There is less consistent empirical support for the opportunistic approach to the political business cycle.

Although establishing the empirical regularities of output is an important first step for establishing the existence of a political business cycle, the transmission mechanism through prices is less evident in the data. Inflation should be higher under Democratic administrations than under Republican administrations. For the United States, there is little evidence to support this conclusion. As Allan Drazen noted in Political Economy in Macroeconomics (2000), “Democratic administrations have lower average inflation than Republican administrations in the first half of their terms, exactly opposite what the rational partisan theory of inflation surprises predicts” (p. 262).

An alternative theory of the political business cycle, termed the real political business cycle, is found in the Journal of Public Economics, in a 2003 article by S. Brock Blomberg and Gregory Hess. Rather than explain the political business cycle as the natural consequence of shifts in regime between two parties who have different tastes for inflation, Blomberg and Hess model the political business cycle as a dynamic process that responds to both partisan and individual leader characteristics in the size and scope of the government. While the parties themselves differ on the size of government, individual leaders also differ in their abilities to deliver on their promises at the lowest cost. Methodologically, their article blends a partisan and opportunistic explanation for the political business cycle with fiscal policy being the impulse for the cycle.
There appears to be stronger empirical support for the transmission mechanism in the real political business cycle. Both tax revenue and spending reveal a strong partisan influence: there is a sharp increase in spending and taxes for Democrats in the second or third years of the election term, with a symmetric decrease in spending and taxes by Republicans. These fiscal changes coincide with the business cycle movements consistent with a real political business cycle. Still, given the mixed evidence supporting certain aspects of real business cycle models, future research is necessary to explain these same aspects in the real political business cycle.

BUSINESS CYCLES, REAL

It is accepted knowledge in empirical macroeconomics that aggregate data are typically characterized by trend and cyclic components. A natural by-product of this is a dichotomy of (empirical) macroeconomics into those who concentrate on growth and those whose main concern is with the cyclical aspects of the data. Although this entry focuses exclusively on the cyclical side of the dichotomy, the business cycle and growth processes are not mutually exclusive features of macroeconomics. That is, one cannot draw any meaningful conclusion about one feature of the data without a comprehensive understanding of the other. It is invariably the case that empirical results hinge on the methodology used to isolate the trend and cyclical components of the data.

What drives business cycles is an important issue for economists and policymakers alike. In his 1994 article “Shocks,” John Cochrane reiterated R. E. Lucas’s 1977 assertion that “business cycles are all alike” (p. 296) in that each cycle exhibits co-movements among macroeconomic variables that are so remarkably similar that the cycles are more likely to be driven by a common force and less so by a composite of several shocks. To that end macroeconomic theories have been written suggesting one shock or another that could possibly explain this cyclical phenomenon.

With abundant research devoted to real business cycles (RBC), the search for that one driving force is still ongoing, and from the early-twenty-first-century state of the literature little progress has been made. (Even though the literature does not seem to be converging on one particular shock the search process has resulted in the development of solution techniques that have contributed greatly to macroeconomics and other related literature. For example, researchers have witnessed the birth of dynamic general equilibrium models and the use of dynamic programming to solve such models.) The literature has presented a gamut of candidate shocks responsible for business cycle movements; shocks to individual preferences and tastes (fads), oil price shocks (e.g., OPEC crises in the 1970s and the Gulf War in 1990), monetary policy shocks, government spending and tax shocks, and technology shocks (shocks that shift the production possibility frontier of a nation). All these shocks, with the exception of technology shocks, have been discredited on grounds of either failing to qualitatively match actual business cycle movements or failing to explain a sizeable portion of the forecast error variance in output. That is, they fail to match the data on quantitative grounds. However, since 1999, empirical studies have begun to question the role of technology shocks in the real business cycle. A host of studies finds results that contradict the technology-driven real business cycle hypothesis. However, Finn Kydland and Edward Prescott received the Nobel Prize in economics in 2004 “for their contribution to dynamic macroeconomics: the time consistency of economic policy and the driving forces to business cycles.” It is obvious, therefore, that there is indeed some benefit to real business cycle research.

The remainder of this entry provides a brief history of business cycle research and the transition of the literature over the years. This account of the history and transition of the literature to the present will be deliberately brief and could be considered an injustice without any objections from the author of this entry. However, this allows the entry to devote more time to the recent developments in real business cycle research. In the end this entry provides suggestions as to where real business cycle theory should be heading.
A BRIEF HISTORY

Business cycle research examines the periodic upswings and downswings in macroeconomic activity that is a feature of industrialized nations. The notion that business cycles are driven by real factors—termed the real business cycle hypothesis—has itself experienced periods of high and low activity over the years. Prior to the Great Depression real theories was the cornerstone of macroeconomics. The onset of the Great Depression then turned the tide in favor of monetary theory. In fact, monetary policy, more accurately monetary policy errors, was believed to be the impetus behind the devastation of the 1930s and it was widely believed at the time that corrective monetary policy and/or more active fiscal policy were the most likely candidates to turn around the economy.

Since the late twentieth century, real shocks have been the focus of macroeconomists and since the 1970s and early 1980s real business cycle research can be characterized as a period in which candidate shocks began to be eliminated for one reason or another. For example, shocks to government policy fail to deliver the requisite co-movements among macro variables by predicting a fall in household consumption in time of economic expansion. Changes in capital and labor income taxes occur too infrequently to make them serious candidates for business cycle fluctuations. Oil price shocks, even with volatile energy prices are too small a fraction of value added in production to have any sizeable effect. Monetary policy shocks, even with the addition of some type of economic friction, have small effects. However, research conducted in the 2000s has shown that monetary policy used in tandem with technology shocks can produce responses very similar to those observed in the post–World War II U.S. economy.

Technology shock has been the only survivor of this elimination process and thus the literature has accepted it as the main driving force of business cycles. The argument is that when there is a positive technology shock, peoples’ marginal productivity increases, causing real wages to rise; workers will work more hours and output subsequently rises. The opposite holds when the technology shock is negative. This is a pattern economists have observed for industrialized economies since the beginning of the nineteenth century.

Kydland and Prescott (1982) have convincingly argued that a dynamic stochastic general equilibrium model driven by technology shocks can mimic the main statistical features of U.S. macroeconomic time series when calibrated using means and variances of macroeconomic data (using reasonable parameter values to fit the real world) from the U.S. economy. An oft-quoted statement used in support of technology shocks attributed to Prescott (1986) can be found on page 7 of Rebelo (2005), asserting that such shocks "account for more than half the fluctuations in the postwar period with a best point estimate near 75%.” This conclusion has received its fair share of criticisms but somehow the technology-driven paradigm has addressed any serious criticism hitherto leveled against it: the theory survived by adding new features such as labor hoarding, indivisible labor, or capital utilization, which make technology shocks less volatile (thus reducing the probability of technological regress) and enable the theory to better match microeconomic measures of labor supply elasticities.

However, since 1999 a new wave of attacks on the real business cycle hypothesis appears to have delivered the biggest blow yet. These recent studies have found that positive technology shocks, identified using an econometric technique known as structural vector autoregressions, are contractionary on the part of labor input, contrary to business cycle experiences. Contemporary research conducted by Neville Francis and Valerie A. Ramey (2005a) has concluded that the technology-driven real business cycle hypothesis appears dead. The reaction to such a bold statement has been swift and numerous, giving the literature new life. Real business cycle research has reemerged to the forefront of macroeconomics since the mid-1990s.

CONTEMPORARY DEVELOPMENTS

In 1999 Jordi Galí published an article in the American Economic Review that empirically challenged the notion that all factors of production should respond positively to positive technological innovations. Using the econometric technique, structural vector autoregression, Galí identified as technology that shock which has positive effects on labor productivity in the long run. Such identifying assumption is a feature of most RBC models. Using this technique to identify technology shock leads to a fall in per capita hours and not a rise as predicted by the standard RBC theory and as evidenced from actual business cycle experiences. Therefore, the empirical prediction for the role of technology shocks in driving business cycles contradicts the underlying theory. In this regard the literature seems to have undergone a paradigm shift and the search for a new theory of business cycle, which matches with the empirics, should be under way.

However, proponents of the technology-driven RBC paradigm have not taken this blow lightly and have tried to save one of the hitherto cornerstones of macroeconomics. Their criticisms of Galí’s approach are twofold. First, they state that the manner in which the trend in hours per capita is removed is erroneous. In fact they assume that per capita hours being a bounded series should not be treated as having a long run trend and thus no attempt of removing any such trend should be made. If one agrees with this suggestion one will recover, using said structural vector autoregressions, the result from standard theory...
that all factor inputs rise after a technological innovation—here is an example of where the method used to remove trend has implication for the cyclical results as stressed in the opening of this entry. The second point they make is that the tool used in the empirical search, structural vector autoregression, is inappropriate and introduces bias into the results.

In their work in 2004 and 2005, Francis and Ramey address the “trend versus no trend” issue in per capita hours for the United States, both for the post–World War II era and the late twentieth century. They suggest that in order to align the theory to the data there are certain demographic features of the data that are absent from the theory, for example, trends in schooling, aging of the population, and the composition of workers into private and public enterprises. Since the real business cycle theory does not address these issues and they factor so prominently in the data, one might consider removing them from the data. Their removal will make the theory and empirics more compatible. The prediction of labor hours after this exercise is not beneficial to supporters of the technology-driven real business cycle hypothesis as per capita hours again respond negatively to a positive technological innovation.

FUTURE DIRECTION

The search for the driving force of business cycles is ongoing. While researchers have been unsuccessful in finding the candidate shock responsible for this phenomenon they have made some strides in macroeconomics along the way. In particular, research efforts have developed tools like dynamic programming that should figure prominently in economics for some time to come. They have also gone beyond static models and have begun to write models in more dynamic settings. Certainly, this is a practice that is good for the profession, though some researchers have taken it to the extreme by being so mathematical in their approach they have neglected the economics.

The driving force(s) of business cycles is an interesting concept and it will definitely continue. Some have suggested that researchers should first refine the existing model to account for the demographics that are absent from the theory. They maintain that it should not be too much of a stretch to incorporate schooling, aging, and employment composition in the commonly used models of the early twenty-first century. Finally, there are perhaps other shocks out there that have not yet been eliminated. For example, in 1997 Jeremy Greenwood, Zvi Hercowitz, and Per Krusell suggested technology shocks that work through investment goods; however, as of 2006 no consensus has been reached on the plausibility of these types of shocks.

BUSINESS CYCLES, THEORIES

Economic crises of various kinds (financial and commercial failures, crop failures or overabundance, etc.) have afflicted agricultural and industrial societies for centuries. Toward the mid-nineteenth century, however, it was becoming apparent that crises linked to industrial produc-
tion were recurring with some regularity, with common features, and with approximate periodicity. While previous debates on such crises focused on the partiality or generality of “gluts,” the emphasis slowly started shifting from the explanation of individual crises (whose cause could be attributed to one or another historical accident) to the determinants of the general pattern. The theory (or theories) of crises gradually gave place to theories of the recurrence of crises, and eventually to theories of cycles.

The first stages in the transition were the recognition that crises tended to come in “waves” (Tooke 1823, vol. 1, p. 6), mainly described in terms of prices rising and abruptly falling instead of gently gravitating toward their natural level. The distinction of a number of phases regularly succeeding each other followed: Lord Overstone (1837) and S. Mountiford Longfield (1840), for instance, listed ten, but quickly the list boiled down to three to five. Then, estimates of the average period were formulated. An anonymous American reported in 1829 that “an opinion is entertained by many” that the average period of these “fluctuations” that “do take place, and … always will take place in countries, where paper money has been extensively introduced” is about fourteen years (pp. 303–304). In 1833 John Wade estimated it at about seven years, while a few decades later most writers agreed on a period of about seven to eleven years (see Jevons [1878] 1884, pp. 222–224; Miller 1927, pp. 192–193). The seminal intuition that the explanation of the whole sequence requires phases to be linked to each other seems to be due to Clément Juglar (1862). This now paved the way for theorists to look for a cause, set of causes, or at least some premises common to all crises.

During the latter part of the nineteenth century, however, the emphasis remained on crises. Whether conceived as anomalies and interruptions in the normally smooth working of the system, or as the result of intrinsic malfunctioning of industrial economies, crises—with the havoc they brought—remained the focus of theorists’ and practical people’s concerns. This is reflected in the asymmetry of the explanations, often focusing on the interruption of the phase of advance, in the asymmetry of the division in phases, and in the asymmetry of the cycle itself, as almost all authors stressed the abrupt and destructive character of the crisis as opposed to the gentleness of the recovery. This is also witnessed by the terminology of the time; in most languages, the subject was named “theory of crises.”

In truth, the terminology (especially in German, Italian, and French) was slow to adapt to the theoretical change that rapidly intervened at the turn of the century and was completed in the interwar years. In the hands of authors such as Mikhail Tugan-Baranovsky (1865–1919), Dennis Holme Robertson (1890–1963), Arthur Spiehoff (1873–1957), Albert Aftalion (1874–1956), and others, the explanation of the sequence of events became more and more detailed; the other phases were described not only as a launching pad for, or consequences of, crises, but as phenomena of interest on their own ground; and the focus gradually shifted from the crisis to the overall movement. Crises at first became the name of the upper turning point (Lescure [1907], quickly followed by Aftalion [1913] and Mitchell [1913]), and eventually disappeared altogether. Finally, in the hands of the “econometricians” who formulated the first mathematical theories of the cycle in the early 1930s, the cycle became symmetrical, with an even number of phases, all of which were equally important in the overall sine-curve representation of the cycle. Gradual and smooth transitions from one phase to the next substituted for the violence and suddenness of the crises. The prevalent metaphor also changed: while in the prewar literature crises were frequently depicted as a disease of the system (the normal, healthy state of which corresponded to the prosperous phase), the analogy introduced by mathematical economists was that of the pendulum (or rocking horse).

The cycle was thus becoming a new phenomenon: no longer a sequence of crises, but an entity of its own. It became identified by related fluctuations (not necessarily synchronous nor simultaneous, lags were actually called to play a relevant role) in a number of variables, among which prices gradually lost importance (only to regain the center of the stage with the real and equilibrium business cycles theories). Accordingly, the cycle deserved a proper name of its own: the term cycle evokes the returning of the system to a same round of states. The attribute “business” seems to be due to Wesley Clair Mitchell (1874–1948), and reflects his institutionalist creed that the cycle is a phenomenon rooted in the nature of capitalist economies and his emphasis on processes rather than equilibrium. The expression was first used in a number of articles that appeared between 1909 and 1913 and was quickly established in the American literature after the publication of Mitchell’s Business Cycles (1913). The expression trade cycle was already in use in 1879 (Arthur Ellis); it appeared in an article title in 1902 (George Charles Selden), but became established in British usage after the publication of Frederick Lavington’s book with the same title in 1922. The term takes up the emphasis on “commercial crises,” widely spread in Britain, Germany (Handelskrisen) and France (crises commerciales).

**CYCLES AND EQUILIBRIUM**

Almost anyone who counted anything in economics in the first three decades of the twentieth century contributed to the debate on the causes of the business cycle. Not surprisingly, there are as many theories as there are
economists, each emphasizing different mechanisms capable of explaining how the system could go out of gear. New doctrines were formulated, but some of those pronounced in the nineteenth century were further elaborated. Among these doctrines are to be cited those relying on the mechanisms of credit and banking, which often blamed overspeculation, and especially the tradition focusing on the lack of demand with respect to supply, whether in the form of underconsumption or of overproduction. The denomination of these and other causes, with its stress on excesses or shortages, reveals the general attitude of arguing in terms of a comparison to some norm, not always explicitly identified but providing nonetheless a reference point.

Other authors focused on the development of vertical or horizontal imbalances, overinvestment, overindebtedness, or psychological mechanisms. The result is a plethora of causal explanations of variegated (and sometimes irreconcilable) character giving rise to currents of thought based on different views as to the working of the economic system, in particular between those who blamed the supply side of the economy and those who lamented the lack of sufficient demand. (For a still-classical classification of theories based on the alleged causes of cycles see Gottfried Haberler [1937], who also attempted to synthesize what is good in these explanations.)

Parallel to the proliferation of cycle theories and models, the interwar years were also marked by reflections on the ultimate nature of crises and cycles and the possibility of theorizing the phenomenon. The divide between two mutually exclusive groups became apparent. On one side, the “orthodox” approach conceived of equilibrium as a state toward which the system ultimately tends. In this view, fluctuations can only be explained as the result of some external force temporarily maintaining the system in disequilibrium. Accordingly, the system’s rhythmic movement results from the variable’s tendency to return toward its “natural” state (or to move toward a new position, to become the “natural” one), perhaps with some kind of impediment (such as Aftalion’s construction lag) in response to an exogenous disturbance to equilibrium. The latter is the cause of the crisis, while the system’s structure determines the mode in which movement takes place. The “heretics,” on the contrary, believed that the economic system does not have an intrinsic tendency to move toward a position of rest (or a path of balanced growth), but tends instead to further depart from it. In this view, movement is the “natural” state of the system, and the problem is that of explaining how movement is constrained and why the system does not explode or collapse. The cycle results from endogenous forces, although exogenous events can be called to explain the specificity of individual cycles.

The “heretics” themselves (the terminology is due to John Maynard Keynes [1883–1946], who in 1934 claimed to be one of the dissidents) were keen to stress that the “orthodox” assumed cycles and crises away from their premises, and some clearly pointed out that this exclusion regarded the relationship of cycles and equilibrium (e.g., Keynes 1934; Löwe 1987; Boulatian 1922). Two aspects were involved. One concerned the possible divergence between the individuals’ optimizing behavior and the system’s capacity of reproducing its own state. While most orthodox economists argued that the individuals’ maximization of utility or profit brings an overall satisfactory state of affairs by clearing all markets, a number of heretics argued that this is not necessarily so, and found in this divergence one of the possibility of crises.

The second aspect concerns the stability of equilibrium. The most explicit discussion is due to Adolf Löwe (1893–1995; name changed to Adolph Lowe), who argued that a theory of the cycle is impossible within the premises of equilibrium economics because “the structure of a process which is always in equilibrium over time cannot undergo any change by definition” ([1926] 1997, p. 269); Löwe concluded that the presupposition of the stability of equilibrium should be rejected (see also Kuznets 1930). Friedrich Hayek (1899–1992) agreed that the logic of equilibrium theories (he referred to the general equilibrium theory as developed in Lausanne; the argument, however, applies in a wider sense) requires that the disturbances of equilibrium must come from outside. However, he disputed Löwe’s conclusion by arguing that the proper procedure is to examine how a suitable disturbance of equilibrium—in particular an expansionary banking policy—gives rise, by the operation of the fundamental forces tending to bring the system back to equilibrium, to permanent oscillations (Hayek [1929] 1933, pp. 42–43). Roy Harrod (1900–1978) dispensed with Hayek’s concern with the departure from equilibrium and, as Löwe, focused on the possibility and the persistence of disequilibrium. Harrod’s “instability principle,” that is, a destabilizing factor introduced at the outset, is a premise to the “very kind of explanation” required for a “rational account of the trade cycle” (Harrod 2003, p. 304; 1934, pt. 3).

The stability issue, in relation to the necessity of relying on exogenous factors, was also one of the main methodological issues among macrodynamic mathematicians, whose contribution was also notable for the introduction of modeling in terms of functional equations, linked to a definition of dynamics as the description of “how a situation grows out of the foregoing” (Frisch 1933, 1936). Michal Kalecki’s (1899–1970) mathematical model producing constant-amplitude fluctuations (1935) is perhaps the best-known case: it was criticized as being structurally unstable and dependent upon a special
configuration of parameters (Frisch and Holme 1935).
Ragnar Frisch (1895–1973), who had originally postu-
lated that one should distinguish the impulse from the
propagation problems (1935), suggested instead that
Kalecki's interesting model should be damped but kept
alive by exogenous shocks. Kalecki struggled all his life
with this problem, but failed to solve it to his own satis-
faction. Nicholas Kaldor (1908–1986) criticized one of
Kalecki's attempts by arguing, similarly to Harrod, that
equilibrium must be unstable if the system is to generate
endogenous fluctuations (1940).

Richard M. Goodwin (1913–1996) showed that the
problem of the persistency of fluctuations, to which
Frisch's proposal was a solution, is rooted in the assump-
tion of linear relationships and incapable of giving rise to
fully endogenous sustained cycles (1951). If this assump-
tion is relaxed, it is possible to deal at once with cycles and
growth (an issue dear to a number of interwar economists,
particularly Robertson [1915, 1926] and Joseph Alois
Schumpeter [1883–1950, from 1910]). In addition, per-
sistent cycles consist in oscillations (or chaotic movement)
around an unstable stationary state—precisely the point
advocated, in more generic and intuitive terms, by the
"heretics"—kept within bounds by endogenous or semi-
exogenous constraints, such as population or resources.

Equilibrium and real business cycle theories took a
different route, reviving the "orthodox" approach by tak-
ing up two different threads: Hayek's (Lucas [1977]; who,
however, eventually admitted [1994] he had misread
Hayek) and the impulse approach (more Slutsky's [1937]
than Frisch's; see Lines [1990]). The cycle is viewed as the
result of the economic agent's rational reaction to signals,
transmitted via the price system (in conditions of imper-
fect information, in the monetary business cycle theory)
triggered by exogenous impulses coming either from the
monetary system or the real economy (productivity
shocks, in particular), respectively. The cycle is no longer
the result of a tendency to equilibrium: each configuration
of the system is understood as an equilibrium state—as
declared by the rational expectations hypothesis.

The contrasts among contemporary business cycle
theories therefore reflect the same fundamental conflict of
views on the working of an economic system that has
characterized the long history of attempts to explain
fluctuations. Some believe depressions to be the result of
frictions or to be caused by external forces or by misman-
agement of the economy on the part of the government.
Others, on the contrary, interpret them as the result of the
intrinsic absence (or, at least, serious and systematic fail-
ures) of self-regulating properties of economic systems (to
which, perhaps, only public intervention can give rem-
edy). It would not seem that these lines of thought, rely-
ing not only on different worldviews but also on
antagonistic methodologies and having different objects
of research, can be reconciled. Perhaps this is all for the
good of the discipline, for actual crises have always been
the stimulus of fruitful theoretical debates, which can only
thrive insofar as different viewpoints are held.

The technical name for the butterfly effect is sensitive dependence on initial conditions. It was first proposed in meteorology but has an impressive array of implications in a variety of fields. Simply put, the butterfly effect occurs when a very small event has exceedingly large and far-reaching impact. The metaphor of the butterfly is used because a butterfly’s wings, fragile as they are, do not stir up much air as they flap, but even that minute movement may initiate a series of changes that grow such that they eventually cause a large storm thousands of miles away. In broad terms, then, the butterfly effect implies that large events may be tied to small, or even minuscule, occurrences.

The butterfly effect was used initially to explain why weather forecasts were frequently inaccurate. Initial conditions, sometimes quite subtle, tended to go unnoticed, so forecasters did not take them into account—yet those minute conditions eventually created hurricanes or similar sizeable changes in the weather. It is this insight concerning the large potential impact of minor occurrences that gives the butterfly effect broad appeal in many other fields, including psychology: It explains why predictions are often inaccurate. Recognizing the importance of initial conditions can dramatically improve the accuracy of scientific predictions.

The butterfly effect was discovered serendipitously and shows the benefits of interdisciplinary research efforts. The meteorologist Edward Lorenz, who first described the butterfly effect, saw meaningful patterns in what appeared to be random events in weather patterns. He studied them mathematically, and eventually caught the attention of other meteorologists. These ideas contributed significantly to the new science of chaos. To simplify, what appears to be chaotic may in fact reflect a nonlinear pattern in which seemingly negligible events have dramatic impact. This process is chaotic neither in the sense of being unpredictable, nor in the sense that the contributing factors cannot be determined. Instead, causes are related to effects in a nonlinear fashion, and although the
results may appear to be chaotic, they are in fact deducible if nonlinear reasoning is applied.

Physicists, biologists, epidemiologists, ecologists, and psychologists now consider the butterfly effect, chaos, and nonlinear reasoning when making certain predictions. This has proven to be very useful in various social and behavioral sciences, as well as the physical and biological sciences. Data from a measles epidemic in New York City, for example, supported the new ideas of chaos and the butterfly effect, as did studies of the population variations of the Canadian lynx. Lightning and clouds showed the same trends and patterns, as did phenomena on much smaller scales, such as blood vessels and proteins, and on much larger scales, such as oceans, stars, and galaxies. This is one of the attractions of chaos theory: It applies regardless of scale.

The implications for the social sciences are suggested by the population patterns noted above, but implications for individuals are at least as clear. The butterfly effect in particular has been used to describe a variety of seemingly unpredictable behaviors and seemingly unpredictable thinking patterns. What may appear to be random or meaningless ideation, such as that of some psychotics, can, for example, be understood as a result of nonlinear reasoning. Along much the same lines, creative insights, which are by definition original, may be understood by taking initial perspective into account and allowing for nonlinear cognitive processes that may lead to a surprising insight or creative solution to a problem. Behavioral tendencies such as these were for many years difficult to understand, but the butterfly effect has improved our understanding of them in dramatic fashion.

Mark A. Runco
Amílcar Lopes Cabral was born on September 12, 1924, in Bafatá, Guinea-Bissau. His father, a Cape Verdean, was a poet, polemicist, and schoolteacher; his mother was a shopkeeper, guest house owner, and later, seamstress. The family moved to the Cape Verde when Cabral was four. He was home-schooled until twelve. He did his primary schooling in Praia and subsequently went to Gil Eanes Lyceum in Mindelo, São Vincente Island. Gil Eanes was then a literary and social beehive, alive with discussion groups and social activists examining Cape Verde’s social and economic deprivation amid continuing droughts and famine. Cabral was deeply influenced by these discussions and the reality surrounding him. By the time he left for Portugal to pursue university studies in the autumn of 1945, he was transformed, committed to leading an active, socially transformative life.

During his seven years in Portugal Cabral studied agronomy. He developed an aptitude for detailed field-work and quantitative analysis. He deepened his qualitative analytical skills and mastered the art of public speaking and diplomacy. And he proved highly successful at organizing discussions, meetings, and study groups while foiling surveillance.

Cabral graduated in 1952. He subsequently returned to Guinea-Bissau, where he stayed intermittently until 1959. While there, he helped found Partido Africano da Independência de Guinea e Cabo Verde (PAIGC), or the African Party for the Independence of Guinea and the Cape Verde Island.

Cabral and his leadership have attracted wide-ranging views. As a doer, however, Cabral is more graspable. He helped found the PAIGC as a binationalist party, tying the Cape Verde Island’s political future and logistical fate to that of Guinea-Bissau. As a political strategist he was said to have masterminded a countrywide mobilization campaign preparing Guinea-Bissauans for liberation. As the PAIGC’s chief negotiator and diplomat, he traveled internationally for nearly thirteen years, paying over eighty visits to twenty-odd countries, logging some 600,000 miles. These visits brought in much-needed military aid and humanitarian assistance vital to sustain the war effort and nation building.

Cabral was shot dead at point blank range on January 20, 1973, just as he was getting out of his vehicle outside his home in Conakry. His killing was politically motivated. His murderer, Innocencio Kani, led a group of dissidents who wanted Cabral replaced with someone less “Cape Verdean” and more “Guinea-Bissauan.” On the other hand, the Portuguese armed forces, then led by General António Spinola, aided and abetted this group to have Cabral replaced with someone willing to reach a negotiated settlement for Guinea-Bissau only.

Cabral wrote extensively. His poems sought to capture the travails of Cape Verdeans, the fragility of their culture in a rapidly emaciating economy, and the social and emotional consequences of such hardships on culture, identity, and social cohesion. Of his numerous professional monographs, none surpass in importance the 1956 200-page fieldwork document evaluating Guinea-Bissau’s agricultural demography. The study took several years to complete and entailed traveling some 37,000 miles to visit 2,248 peasant holdings.
Cabral’s work on race and colonialism is steeped in his lived-in experience. He deeply felt the need for Africans, and for that matter anyone under colonial rule, to “re-racialize”—to return to the source. He saw this as an imperative for self-determination, a preconditional rediscovery of one’s identity and culture, as it were, to begin the real overt fight to set oneself free from coloniality and colonialism.

CALIFORNIA CIVIL RIGHTS INITIATIVE
The California Civil Rights Initiative, a 1996 ballot measure also known as Proposition 209, ended affirmative action for women and minorities in California public education and contracting. It gained little attention when it was first written by two California academics, Thomas E. Wood and Glynn Custred, in the early 1990s. However, during their second attempt to put the initiative on the 1996 ballot, it won the support of Governor Pete Wilson and the financial backing of the state Republican Party. Both Wilson and the party saw it as a potent way for the Republicans to win California’s fifty-four electoral votes in the 1996 presidential election. They hoped it would become the same type of political wedge issue that the anti-immigrant Proposition 187 became in 1994, the year the Republican Party took control of Congress and nearly every state office in California.

Midway through the 1996 campaign, the conservative African American businessman Ward Connerly, appointed to the University of California (UC) Board of Regents by Wilson, became the chair and chief spokesman for the initiative. The language of the initiative and the campaign were both designed to take advantage of what polls have consistently demonstrated: that whereas in general a slight majority of Americans support affirmative action for women and minorities, the vast majority will oppose it if it is described as preferences for women and minorities. Both the initiative’s language and the political campaign to support it used the word preferences and omitted any mention of affirmative action.

The opposition campaign, run by a collection of grassroots organizations—the Feminist Majority, NOW, the ACLU, and the NAACP Legal Defense and Education Fund—began its fight early, but never earned the political or financial support of the state or national Democratic Party. President Clinton, who visited California several days before the vote, never urged voters to reject the initiative.

In the end, the initiative won approval with 54.6 percent of the vote, including 58 percent of white women voters and 66 percent of white men. Although some voters remained confused on Election Day about the initiative’s intent, it was the use of the word preferences, and the public’s long aversion to affirmative action when described using this word, that insured the measure’s victory.

Moreover, voters who benefited from affirmative action or preferences no longer connected their success to these programs. White women, for example, had been the main beneficiaries of affirmative action or preferences, but polling by both campaigns showed that white women no longer connected their success to these programs and many believed that affirmative action hurt job prospects for their male children and husbands.

A Los Angeles Times exit poll showed that the initiative was rejected by 74 percent of African Americans voters, 76 percent of Latinos, and 61 percent of Asians. The Asian vote surprised some analysts because Asians are well represented at the state’s premiere universities, but their own experience of facing discrimination after graduating from college and the leadership of the late UC Berkeley chancellor Chang-Lin Tien encouraged Asians to support affirmative action.

The impact of the California Civil Rights Initiative has been tremendous. Latino and African American enrollment at UC Berkeley and UCLA has never recovered. State contracting for firms owned by women and minorities has dropped sharply. Copycat initiatives have failed in Florida and Houston, but succeeded in Washington and in Michigan.

CALYPSO

Calypso is a style of Caribbean music associated with the island of Trinidad in the West Indies and linked very closely to the annual celebration of the pre-Lenten carnival. The music, as well as the name itself, has uncertain roots, yet scholars generally agree that calypso is an example of a hybrid musical form resulting from the interactions of colonizers, slaves, and others from the eighteenth century onward. While calypso grew out of a myriad of traditions, it has spawned a number of separate musical genres such as soca, rapso, talkalypso, chutney soca, and others.

Although there is no general agreement as to the origin of the term, there are references in Trinidadian newspapers of the nineteenth century to cariso and kaiso, both song forms characterized by the performance of extemporaneous, satirical lyrics. The term kaiso, which was shouted to encourage or praise successful singers, is considered a possible source for the word calypo, and indeed is still used instead of calypso. The cariso is only one of many song forms to emerge from the colonial era in Trinidad. Creole slaves and free Africans contributed a variety of songs and dances, including the bel air (derived from both African and French sources), the juba, the bamboula, the calinda (both a martial art and a song style), and the lavwa (a road chant performed during carnival processions). Combined with these forms were British ballads, French folk songs, Venezuelan string music, and other types of Creole West Indian songs. Furthermore, as new musical forms were created or introduced to the island—American jazz, Venezuelan paseos, and ultimately such diverse forms as Hindi film music, reggae and dance-hall, soul, and rhythm and blues—they were incorporated into calypso.

HISTORICAL BACKGROUND

Claimed for Spain by Christopher Columbus in 1498, Trinidad has played host to colonizers, slaves, indentured laborers, and immigrants from diverse cultural backgrounds, many of whom contributed their own musical forms to the mix. However, the African musical forms of the slaves and the musical styles of French, English, and Spanish colonizers exercised perhaps the greatest influence.

Trinidad was opened by Spain to French colonists first in the 1770s and later in 1783. The French dominated the cultural life of the island up to and even beyond the English conquest in 1797. The French imported their pre-Lenten festival of carnival, and much of the earliest carnival music was sung in Creole or patois. During the nineteenth century, English culture, language, and religion increased in importance and influence, and many of the folk musical styles gradually changed from French Creole to English. As the English extended their hegemony over the island, they also embarked on a mission of reforming the carnival. By the 1880s unruly masqueraders and riots against police repression resulted in a massive campaign of controlling and channeling the public celebration into a manageable event. By the early 1900s calypso music, marked lyrically now by social satire, political commentary, humor, and sexual innuendo, was largely being performed in “calypso tents,” temporary venues in which calypsonians competed against each other for prizes offered by private sponsors.

The first calypso recordings were made in 1914, and by the 1920s and 1930s Trinidad’s finest calypso singers, such as Attila the Hun, Roaring Lion, and Lord Invader, were regularly recording and performing in the United States. “Rum and Coca-Cola” (1944) by the Andrews Sisters, a sanitized reinterpretation of a Lord Invader song, became an American hit. It also spawned a landmark lawsuit by Lord Invader against the American actor Morey Amsterdam, who illegally copyrighted the lyrics. Invader won the suit.

Although they faced routine censorship by the British colonial authorities, the calypsonians of this period, sometimes referred to as the golden age of calypso, displayed enormous creativity and invention in circumventing restrictions placed on them and creating songs rife with double entendre, inside jokes, and subtle parody. Audiences relied on clever calypsonians for insight into the ironies of colonial rule, the hypocrisy of the ruling classes, the meaning of certain scandals and outrages, and so on. Savvy politicians could often “take the temperature” of the public by the attitudes of their calypsonians.
SOCIAL COMMENTARY

From its earliest days, calypso music served as a forum for the expression of social and political views within the Caribbean. Remarkably, the criticism mounted by calypsonians was not limited to broad appeals against inequality, racism, poverty, and oppression, but tackled precise specificity laws, domestic policy, proposed legislation, foreign policy, labor relations, actions by public figures, and even speeches given by notable persons. Thus, in addition to humorous rivalries between singers, songs about the beauty of the land, and compositions with a ribald flavor, calypsos were composed with such titles as “Prison Improvement,” “Shop Closing Ordinance,” “The Commissioner’s Report,” “The European Situation,” “Devaluation,” “Slum Clearance,” “Reply to the Ministry,” and, fittingly, “The Censoring of Calypsos Makes Us Glad.”

AFRICAN-INDIAN RELATIONS

The arrival of indentured laborers from South Asia from the 1840s until 1917 dramatically changed the ethnic makeup of Trinidad. Competition for work and land created tensions between the island’s Africans and South Asians that ultimately manifested in political divisions being drawn along ethnic lines. Although never reaching the violence and discord of Guyana, where a similar immigration took place, the presence of Indians in Trinidad was closely followed by calypsonians. Initially, many calypsos dealing with Indians discussed “strange” customs, delicious food, and beautiful women. Creole calypsonians often commented in song on how they fell in love with an Indian girl or how they were able to participate in an Indian feast. As political tensions heated up during the 1950s, however, calypsos became more pointedly political. By 1961 the calypsonian Striker, registering his dismay at the deep ethnic division present in local politics, remarked in song that “Negro can’t get a vote from Indian.” Today there are a number of noted Indian calypsonians, both men and women, as well as African artists performing in the Indian-influenced genre of chutney soca. Even so, tensions between the two communities persist and are often played out musically over the airways and in the calypso tents of Trinidad.

In addition to the rebellious and resistant side of calypso, there was a strong dose of patriotism (songs in favor of England during the Boer War [1899–1902], World War I [1914–1918], and World War II [1939–1945], for instance, were common). Furthermore, calypsonians recorded the achievements of the British Empire and the royal family with great enthusiasm. Compositions in favor of the Empire coexisted with little discomfort alongside songs detailing the often oppressive conditions under which the children of the Empire labored.

Although not technically a calypso, the well-known “Banana Boat Song,” a traditional Jamaican folksong whose best-known rendition was recorded by Harry Belafonte on his 1956 album Calypso, helped to make that album the first to sell more than a million copies.

CALYPSO SINCE INDEPENDENCE

In 1956 a calypsonian known as the Mighty Sparrow penned “Jean and Dinah,” a commentary in song about the sudden availability and desperation of prostitutes in Port of Spain after the departure of the free-spending American sailors stationed in Trinidad during World War II. While the song became an international hit, and won the calypso “crown” for Sparrow, it is perhaps even more important as a testimony to the renewed sense of cultural and political confidence then being experienced across the Caribbean as independence movements were flourishing. The 1950s marked a pivotal point in the development of calypso and perhaps inaugurated what might be called the “independence period” in calypso.

As Trinidad, Jamaica, Barbados, and other English-speaking islands continued their drive toward independence from the United Kingdom, folk idioms such as calypso, carnival, steel band, the musical form ska, and even sports such as cricket began to take on a nationalist tone. Nation-building calypsos, as they are sometimes called, emerged to praise the efforts of certain political parties and politicians and to encourage proper behavior and decorum among the populace.

The 1960s brought to the Caribbean not only independence but also the Black Power movement. Calypso reflected this new cultural consciousness lyrically; it also reflected the cultural source from which it came—the United States. One of the most important figures to emerge at this time was the Mighty Chalkdust, a teacher and calypsonian who obtained his Ph.D. from the University of Michigan and has, under his given name, Hollis Liverpool, researched and published widely on calypso, carnival, and Trinidadian culture in general.

Traditionally accompanied by acoustic music, calypso increasingly came to incorporate electronic instrumenta- tion and the influence of North American musical styles such as rhythm and blues and soul. Alongside Black Power came the women’s liberation movement and increasing (though still small) numbers of women singers. Indeed, women as calypsonians are not given nearly the attention they deserve in the literature. Although largely excluded from the ranks of early recorded calypsonians, and often derided in songs such as “Jean and Dinah,” women have been instrumental in the development of Trinidadian music as chantwells (praise singers for stickfighters and
singers of road marches) and in religious music. In the 1960s, attitudes toward women calypsonians began to change, and it was, perhaps ironically, the Mighty Sparrow who gave the then-unknown singer Calypso Rose her start. Along with Singing Francine and Denyse Plummer, Rose has become one of the most popular calypsonians of all time.

With the rise of outside influences from North America came further influences from diverse musical sources, including Jamaican reggae and (due to the presence of a large and thriving Indian population) Hindi film music. The result has been the development of new musical forms, such as soca, chutney soca, rapso, raga, and others.

Born in 1941, Garfield Blackman, known as Lord Shorty, would become the creator of soca music. Concerned that calypso was declining in relation to reggae, Lord Shorty experimented with the calypso rhythm. He combined Indian instruments such as the dholak, tabla, and dhantal with traditional calypso instrumentation. The result was a new musical hybrid that he called solka. With his 1974 album Endless Vibrations and the single “Shanti Om,” Shorty sparked a revolution in Caribbean music. Initially the term solka referred to an attempt to recapture the “soul of calypso,” which he felt was one of inclusion, common struggle, and resistance to oppression. Shorty hoped that the “Indianization” of calypso would bring together the musical traditions of Trinidad and Tobago’s two major ethnic groups, the descendants of African slaves and of indentured laborers from India. The name was later changed to soca, and it is routinely if erroneously explained as a fusion of soul and calypso.

By the turn of the 1980s soca was rapidly becoming the music of choice for Trinidadians during carnival time. The Montserratian singer Arrow did much to popularize soca internationally with his 1983 number-one soca classic “Hot Hot Hot.” Due to the globalization of the music industry, soca has evolved swiftly and has incorporated many outside influences, spawning such diverse subgenres as ragga soca and chutney soca. Although soca has become increasingly popular, many critics within the region have pointed to its reluctance to be anything more than “party music.” The political and social commentary once so central to calypso has had to find a new home in other Caribbean musical genres. In Trinidad this mantle has largely been taken up by rapso. Rapso is a unique style of street poetry from Trinidad and Tobago that originated in the 1970s (although it was not named rapso until the 1980s by Brother Resistance). Often credited to Lancelot Layne, rapso was created in a spirit of political protest and social justice. Layne’s 1970 hit “Blow Away” is considered the first rapso recording. Layne is also well remembered for his 1971 recording “Get Off the Radio.”

Beginning as a folk music of protest, social commentary, and political satire, calypso has emerged as one of the most important, internationally recognized, and fecund musical forms of the twentieth century.

CAMBRIDGE CAPITAL CONTROVERSY

The Cambridge capital controversy refers to a debate that started in the 1950s and continued through the 1970s. The core of the debate concerns the measurement of capital goods in a way that is consistent with the requirements of neoclassical economic theory. The debate involved economists such as Piero Sraffa, Joan Robinson, Piero Garegnani, and Luigi Pasinetti at the University of Cambridge in England and Paul Samuelson and Robert Solow at the Massachusetts Institute of Technology in Cambridge, Massachusetts. In a now-famous Quarterly Journal of Economics publication from 1966, Samuelson admitted the logical validity of the British critique of the neoclassical theory of capital (Samuelson 1966). Yet, Solow (1963) claimed the debate was largely a sideshow to the core of neoclassical analysis.

The essence of the debate revolved around the fundamental premises of the theories of value, distribution, and growth, each of which depends upon an aggregate production function where the inputs or factors of produc-
tion for capital and labor are aggregated in some fashion prior to the determination of the rate of profit (interest) and the wage rate. According to neoclassical theory, the price of each factor of production is determined by its marginal contribution to production; furthermore, there exists substitutability between factors of production that gives rise to diminishing returns. As a consequence, the rate of profit (or interest) is the price of capital and as such reflects capital’s relative scarcity; more specifically, a relative abundance of capital, in combination with the law of diminishing returns of a factor of production (whereby the greater use of an input will imply a lower marginal product, other things being equal) will give rise to a low rate of profit (interest). The opposite would be true in the case of a relative scarcity of capital. Capital income would amount to the product of the rate of profit times the amount of capital employed.

Piero Sraffa pointed out that there was an inherent measurement problem in applying the neoclassical model of value and income distribution, because the estimation of the rate of profit requires the prior measurement of capital. The problem is that capital—unlike labor or land, which can be reduced to homogenous units stated in their own terms (for example, hours of the same skill and intensity or land of the same fertility)—is an ensemble of heterogeneous produced goods, which must be added in such a way as to enable a cost-minimizing choice of techniques. From the various alternatives, neoclassical theory chooses to measure capital goods in value terms; that is, the product of physical units (buildings, machines, etc.) times their respective (equilibrium) prices. Joan Robinson (1953), inspired by Sraffa’s teaching and early writings, and later Sraffa himself (1960), argued that the value measurement of capital requires the prior knowledge of equilibrium prices, which in turn requires an equilibrium rate of profit that cannot be obtained unless we have estimated the value of capital.

Clearly, there is a problem of circularity here that the Cambridge, Massachusetts, economists sought to resolve. Paul Samuelson, in particular, presented a model based on the heroic assumption that capital-intensity is uniform across sectors, which is equivalent to saying that there is a one-commodity world. In such an economy, as income distribution varies, the subsequent revaluation of capital gives rise to results that are absolutely consistent with the requirements of neoclassical theory. In fact, Samuelson derived a straight-line wage–profit rate frontier (the mirror image of the usual convex isoquant curves), each one representing a cost-minimizing technique, and this gave rise to a well-behaved demand-for-capital schedule. Parenthetically, Samuelson attacked Marxist value theory for its alleged inability to explain relative prices. However, if one applies Samuelson’s heroic assumption of an equal capital intensity across all industries to Marx’s labor theory of value, then all of Samuelson’s criticisms of Marx become irrelevant. This irony was not unnoticed by the British participants in the capital debates.

Samuelson’s assumption was attacked for lack of realism by Garegnani, Pasinetti, and Amartya Sen, among others, who showed that once we hypothesize different capital intensities across industries, the neoclassical results do not necessarily hold. The idea is that as relative prices change the revaluation of capital can go either way, and it is possible for an industry that is capital-intensive in one income distribution to become labor-intensive in another. As a consequence, we no longer derive Samuelson’s straight-line wage–profit rate frontiers, which are consistent with the cost-minimizing choice of technique and give rise to well-behaved demand-for-capital schedules. In the presence of many capital goods and various capital intensities across industries it follows that the wage–profit rate frontiers are nonlinear and may cross over each other more than once, which means that for a low rate of profit one may choose a capital-intensive technique. As the rate of profit increases, the technique with a lower capital intensity may be chosen, and for a higher rate of profit the original technique of higher capital intensity is chosen again. We observe that a capital-intensive technique may be chosen for both low and high rates of profit, a result that runs contrary to the neoclassical theory of value and income distribution. Under these circumstances we cannot determine a well-behaved demand for capital schedule and so the whole neoclassical construction is under question.

It is important to point out that the capital theory critique does not affect the classical theory of value and income distribution, because the classical theory does not claim that relative prices of factors of production reflect relative scarcities; additionally this theory assumes one of the distributive variables, usually the real wage, as a datum that in combination with the given technology and output level determines the relative equilibrium prices together with the equilibrium rate of profit. Furthermore, the evaluation of heterogeneous capital goods can be achieved in terms of labor values; hence there might be a problem of consistency because variables estimated in terms of labor values will differ from those estimated in terms of equilibrium prices. This, however, is mainly an empirical question and the empirical research has shown that the two types of prices are close to each other, and variables estimated in labor values or equilibrium prices are approximately equal to each other (Shaikh and Tonak 1994, p. 143).

The capital controversy had an initial effect on neoclassical economics, but soon it was forgotten to the point that the new generation of neoclassical economists either dismisses it or simply does not know it. As a result, both
theoretical and empirical neoclassical research makes use of aggregate production functions, where capital is still used along with labor in the determination of output and the marginal products of these inputs are estimated on the assumption of substitutability between factors of production, as if the capital controversy never happened. At the close of the twentieth century, there were new efforts by the so-called modern classical economists to revive the classical approach, and once again the capital theory began to surface in mainstream journals, which may revive theoretical questions that puzzled the best Cambridge economists in England and the United States.

The Cambridge capital controversy revived interest in Marxian economics, contributed to the founding of neo-Ricardian or Sraffian economics, and inspired the development of post-Keynesian economics. Indeed, it was Sraffa’s 1920s critique of the neoclassical theory of the firm and Sraffa’s proto-critique of neoclassical value theory that greatly influenced Keynes’s General Theory of Employment, Interest, and Money (1936). British interpretation of Keynes’s influential publication assumed a classical theory of value and distribution, while the U.S. interpretation sought to integrate Keynes into the neoclassical theory of value and distribution. This difference in understanding Keynes led Joan Robinson to refer to her American counterparts as “bastard Keynesians” (Harcourt 1982, p. 347). Finally, in another famous barb, Robinson once said that because she never learned math she was always forced to think. Robinson’s mathematics never went beyond basic algebra and very elementary geometry—the kind of math mastered by many American students in the first two years of high school. On the other hand, Samuelson’s economic analysis has led the way in the use of calculus, linear algebra, differential equations, real analysis, and mathematical programming. Robinson’s biting comment is a warning to economists not to allow mathematical technique to triumph over substantive understanding of how real-world economies operate.

CAMBRIDGE UNIVERSITY
The University of Cambridge, it is generally accepted, came about as a result of a migration from the University of Oxford in 1209. The existence of a studium at Cambridge was recognized by a papal degree of Gregory IX dated June 14, 1233, and by about 1250 a draft of its statutes had arrived in Rome (Anglica MS 401). These were preceded by recognition from the Crown in 1231. The university’s first college, Peterhouse, was founded in 1284, and today there are thirty-one colleges, the latest, Robinson, founded in 1977.

The earliest studies of the university followed the usual pattern for medieval universities, with a particular emphasis on canon law, a trend encouraged by the foundation in Cambridge of large Franciscan and Dominican houses, to be followed by several other orders.

In 1381, in a manifestation of the Peasants’ Revolt, the townspeople of Cambridge made assaults on both the university and the colleges, notably on Corpus Christi College which, uniquely, had been founded by the amalgamated town gilds of St. Mary and of Corpus Christi (in 1352). This resulted, ironically, in royal charters greatly increasing the university’s dominance of the town, including the oversight of weights and measures and other day-to-day business.

Although royal and papal recognition came earlier to Cambridge than it did to Oxford, Cambridge was certainly the lesser of the two universities until the English Reformation in the sixteenth century. Cambridge men were dominant in both church and state under Henry VIII (e.g., Thomas Cranmer) and Elizabeth I (e.g., William Cecil and John Whitgift), but during the English Civil War (1642–1649), when the royal court removed to Oxford, the balance was reversed.

Academically, Cambridge’s eminence was enhanced in the early eighteenth century by the pupils of Isaac Newton, and for more than a century thereafter mathe
matics was the prime field of study and the only subject in which examinations for degrees were conducted. In the nineteenth century degrees became available in law (1816) and classics (1824), and later in the century other honors courses were introduced, natural sciences first, then moral sciences (philosophy) and gradually others. Although students of the natural sciences were at first few, it was this school that from the 1870s raised Cambridge to the status of a world-class university, with researchers coming from far and wide to work with the physicists James Clerk Maxwell (Cavendish Professor of Experimental Physics, 1871–1879) and his successors J. W. Strutt, Baron Rayleigh, J. J. Thomson, and Ernest Rutherford. Since Thomson (1906), Cambridge has been home to some thirty Nobel laureates, including Francis Crick and James Watson, the discoverers of DNA, and since Rayleigh and Kelvin (1902) some forty holders of the British Order of Merit. A roll call of the many earlier luminaries connected with Cambridge must include the teachers Erasmus of Rotterdam, St. John Fisher, Roger Ascham, Sir John Cheke, Richard Bentley, William Whewell, Lord Acton, Sir James Frazer, G. H. Hardy, Bertrand Russell, John Maynard Keynes, E. M. Forster, F. R. Leavis, and Ludwig Wittgenstein; and the alumni Oliver Cromwell, Charles Darwin, and the poets, to name but a few, Edmund Spenser, Christopher Marlowe, John Milton, Alfred Lord Tennyson, Samuel Coleridge, and William Wordsworth.

Barring several false starts in the medieval period and one (Durham) in the seventeenth century, Cambridge and Oxford were the only English (as opposed to British) universities until the 1840s. Given that, they have naturally been the universities of choice for long-established families and schools, and although there was always a variable amount of scope for the admission of the less affluent, in recent years the catchment of both universities has expanded vastly. Except in the sixteenth century, Oxford historically maintained closer relations with church and state (thus sending out more future prime ministers and archbishops), but Cambridge was never very far behind, sending out mathematicians and poets, as well as competing with Oxford for places in the civil service, seats in Parliament, and other influential positions. Some of this perception of prestige continues today, but it has been amply supported by recent national and international rankings that attract students, especially graduate students, from all over the world.

The colleges of the university, in order of foundation, are:

- 1284: Peterhouse
- 1326: Clare
- 1348: Gonville Hall; refounded 1557 as Gonville and Caius College
- 1350: Trinity Hall
- 1352: Corpus Christi College
- 1441: King’s College

CAMPAIGN REFORM
SEE Congress, U.S.; Elections.

CAMPAIGNING
Campaigning is the art and science of “selling” political candidates to voters. Candidates engage in a variety of campaign activities aimed at winning elections, including raising money, building name recognition, making public appearances, purchasing political advertisements, and debating with other candidates. Social scientists who study politics are interested in campaigns and elections because they are important components of American democracy. Elections allow citizens to select leaders and hold them accountable.

Campaigns for public office generally have two stages: the primary election and the general election. The goal of the primary campaign is to gain endorsement from a political party in order to advance to the general election. Primary campaigns appeal to the party faithful, that is, voters who identify with a certain political party. Candidates will often present more extreme policy positions during the primary campaign because they have to appeal to party members who are more ideologically extreme in their views than the general public. During the general election phase, candidates adopt more moderate voter appeals to market themselves to the broader public.

THE EVOLUTION OF CAMPAIGNING
Campaigning techniques changed significantly in the late twentieth century as a result of the popularity of mass communication, namely, television and the Internet. The 1960 presidential race between Richard Nixon and John F. Kennedy marked a turning point in American politics where television gained prominence as a medium for reaching and persuading voters. During this election, listeners who heard the Kennedy-Nixon debate on the radio believed that Nixon had won the debate, whereas viewers who saw the television broadcast thought that Kennedy was the victor.

In addition to requiring candidates to be camera-friendly, television enabled candidates to reach voters directly instead of relying on their political party. The rise of candidate-centered campaigns deflated the power of the major parties in American politics. In response, party officials have come up with new and creative ways to maintain relevance in the electoral process, namely, by providing candidates with media assistance and funding. The political parties’ ability to raise funds is crucial for candidates given that a contemporary national election costs about twenty times more than elections did in the 1950s.

The Internet has played an increasingly important role in campaigns for political office. Voters turn to political blogs and other online resources to get information about elections and candidates. For example, the Web site YouTube makes it possible for people to look at campaign ads from across the country with the click of a button. Not surprisingly, a growing number of candidates for public office are using Internet appeals to reach voters. Experts anticipate that the Internet will become an influential campaigning tool as this medium becomes a popular means of distributing tailored information to voters.

CAMPAIGN FINANCE AND REGULATION
The rise of media-centered campaigns has brought about an increase in the cost of campaigning. According to the Center for Responsive Politics, the 2004 presidential contest cost over $1.2 billion. Some scholars argue that the high price tag attached to winning public office is antidemocratic in that only wealthy candidates have the necessary resources. Others counter that the electoral process...
remains democratic because a majority of campaign contributions come from private individuals. Lawmakers passed several campaign finance reform laws in the late twentieth century and early twenty-first century in an effort to limit the amount of special interest money in campaigns.

The 1971 Federal Election Campaign Act (FECA) limited campaign contributions and required candidates for federal office to disclose all of their financial contributions. FECA also outlawed financial contributions from corporations to candidates. In response, corporate-related organizations—Political Action Committees (PACs)—were formed to influence elections. Subsequently so-called 527 organizations have formed that advocate for certain political causes instead of specific candidates, although their media and other political tactics aim to influence election outcomes. Through issue advocacy advertising, or ads that discuss a political issue in a way that critiques a certain candidate, 527s play an increasingly influential role in elections.

Congress made sweeping changes to FECA in 2002 with passage of the Bipartisan Campaign Reform Act, also known as the McCain-Feingold Act. This legislation outlawed soft money, or money that is ostensibly donated to political parties for “party-building activities” but is often used to help candidates. It also restricted 527 organizations from running issue advocacy ads in the months leading up to an election. It is unclear whether this legislation will have the effect lawmakers intended or special interests will find loopholes enabling them to get around the new restrictions.

GOING NEGATIVE

Candidates have the option of running three different types of political advertisements: issue, image, and negative. Issue ads present the candidate’s stance on policies, whereas image ads attempt to enhance the candidate’s reputation in the eyes of voters. Candidates are increasingly going negative, that is, emphasizing their opponent’s negative aspects instead of their own positive attributes. Most researchers agree that this approach can help candidates win elections, but there is debate as to its potential liabilities. Some argue that negative ads tend to be dishonest, can alienate more moderate voters, and might cause voters to tune out of politics and not vote at all on Election Day. Others argue that negative ads are more memorable than positive ads, increase voter awareness of candidates, and cause more people to turn out to vote. The jury is still out on the overall impact of going negative, suggesting perhaps that its effects vary from race to race.

CAMPBELL, ANGUS

1910–1980

Angus Campbell was born in Indiana, but grew up in Portland, Oregon. He studied psychology at the University of Oregon, and completed his doctorate at Stanford University in 1936 under E. R. Hilgard. He taught at Northwestern University for six years, until World War II brought him to Washington, D.C., to study effects of the war on the public. He was introduced there to large sample surveys, as well as a group of like-minded social scientists headed by the psychologist Rensis Likert.

After the war Likert, Campbell, and colleagues moved to Ann Arbor, establishing the Institute for Social Research at the University of Michigan. Likert headed the institute, and Campbell became director of its largest component, the Survey Research Center (SRC). Here he enjoyed a field staff of interviewers spread over the country who produced valid national samples according to the strictest precepts of modern sampling theory. He also had access to the university’s economists, sociologists, social psychologists, and public health experts who were excited by the new capability to represent the nation with a modest sample of one thousand or two thousand respondents.

While various scholars did studies through SRC, every year, Campbell directed a few personally to address his own wide-ranging interests. He launched a national study of voters before and after the 1952 presidential election. This study has been repeated biennially (to include “off-
year” congressional elections) ever since. This series yields an amazing panorama of trends in America’s democratic processes for more than a half-century.

From the outset Campbell believed that party loyalties are a dominant force in the voting decision, but that voters defect from these loyalties occasionally, depending on the candidates and issues of the day. He wrote a central question to measure such underlying party identification, which remains a critical component of voting studies today.

Among the hundreds of publications from the election series over the years, Campbell and collaborators Philip Converse, Warren Miller, and Donald Stokes wrote a synthesis of early progress, *The American Voter* (1960), which achieved very wide circulation. Its impact was strong on political science as a discipline, which hitherto had focused mainly on historical and institutional studies. This “behavioral science revolution” brought quantification, hypothesis-testing, and estimation of causal flows to the discipline of political science, lending new weight to the “science” in its name. The international impact was also large: Foreign scholars visiting SRC were soon organizing parallel voting studies in their own democracies in Western Europe. By 2006 election studies had spread to nearly four dozen nations, and were intercommunicating to match measurements in order to maximize comparative studies of the voting process.

Campbell himself moved on to other topics. In the civil rights ferment of the 1960s he studied change in U.S. interracial attitudes. By the 1970s he turned to studies of the quality of life as perceived by the U.S. population. Once again, this subject rapidly became popular, and as before, the primary question Campbell wrote to measure a person’s most global sense of well-being remains an essential item for replications of such studies here and abroad.

**CAMPBELL, DONALD**

**1916–1996**

Donald Thomas Campbell was a master methodologist whose intellectual passions and scholarly achievements spanned the fields of social science research methodology, epistemology and philosophy of science, and the sociology and psychology of science.

Campbell’s best-known works are on the methodology of social experimentation and quasi-experimentation (Campbell 1957; Campbell and Stanley 1963; Cook and Campbell 1979; Shadish et al. 2001). They are among the most influential contributions to the methodology of applied social science in the twentieth century. Although others had written about field experiments—for example, the preeminent statistician Ronald Fisher (1890–1962)—it was Campbell who introduced the methodology of quasi-experimentation, an inductive (but nonstatistical) methodology that seeks to understand the effects of the many unmanageable contingencies that lie beyond the control of experimenters. Although quasi-experimentation is “applied,” especially in contexts involving the evaluation of social programs, it is nevertheless “theoretical.” It is grounded in Campbell’s philosophy of critical realism, his epistemology of pragmatic eliminative induction, his methodology of triangulation and the multitrait-multimethod matrix, his theory of pattern matching in science, and his sociology of science (Campbell 1988).

**SOCIAL EXPERIMENTATION AND QUASI-EXPERIMENTATION**

Experimentation and quasi-experimentation are extensions of representative design, a theory of inquiry developed by Campbell’s two most influential teachers at Berkeley, Egon Brunswik (1903–1955) and Edward Tolman (1886–1959). Representative design requires that experiments be conducted in settings that are representative of an organism’s typical ecology. Representative design is a fundamental departure from the classical experiment, in which one independent (treatment) variable is manipulated in order to determine its effect on a dependent (outcome) variable, with all other factors held constant through random selection and statistical controls. Representative design is appropriate when social experiments are carried out in uncertain, unstable, and causally complex environments.

The classical experiment, which involves an independent (treatment) variable that is manipulated in order to determine its effect on a dependent (outcome) variable, requires a treatment and control group, random selection of subjects, and random assignment of subjects to treatment and control groups. If any of these requirements are absent, it is not a classical (“true”) experiment, but a
quasi-experiment. Many of the most important social policy and program interventions are quasi-experiments because political, administrative, and ethical constraints rarely make it possible to satisfy the requirements of the classical experiment.

CRITICAL REALISM AND THE EPistemology of Pragmatic Eliminative Induction

Quasi-experimentation is expressly designed for research settings in which manifold contingencies are beyond the control of the experimenter. These contingencies give rise to many rival hypotheses (alternative explanations of the same outcome) that can threaten the validity of causal claims. Plausible rival hypotheses must be tested and, where possible, eliminated. This process of eliminative induction is an extension of John Stuart Mill’s (1806–1873) joint method of agreement and difference; it also represents a (heavily qualified) version of Karl Popper’s (1902–1994) falsificationist principle that hypotheses can be falsified but never proved.

Pragmatic (not logical-analytic) eliminative induction is part of Campbell’s evolutionary critical Realist epistemology (Campbell 1974), according to which knowledge grows through processes of trial-and-error learning and selective retention. Quasi-experiments in education, welfare, health, and other social policy arenas embody such processes. When entire societies self-consciously and systematically engage in trial-and-error learning and selective retention, they are experimenting societies (see Campbell in Dunn 1998).

METHODOLOGICAL TRIANGULATION AND THE MULTITRAIT-MULTIMETHOD MATRIX

What we know as “truth” or objective knowledge is actually a product of theory interacting with data. Emblematic of Campbell’s methodological work is its synthesis of subjective and objective, perception and reality, theory and data. He accomplished this synthesis through methodological triangulation—a process of comparing two or more perspectives toward the “same” object. His work with D. W. Fiske (1916–2003) on the multitrait-multimethod matrix (Campbell and Fiske 1959) represents a form of theory and method triangulation, where traits posited by a theory interact with methods of observation. The product is some level of convergent and discriminant validity. Underlying the multitrait-multimethod matrix is an epistemology usually referred to as a coherence theory of truth. Campbell and Fiske’s 1959 paper is one of the most widely cited papers in the social and behavioral sciences.

PATTERN MATCHING IN SCIENCE

To the degree that products of the social and behavioral sciences merit the term knowledge, it is because they are grounded in representations of the social world achieved by matching observations of that world with abstract concepts of it. For Campbell, pattern matching is essential for attaining knowledge of everyday cultural objects and indispensable for achieving knowledge of inferred entities in science—the size and brightness of distant stars, the existence and magnitude of latent psychological variables such as alienation or intelligence, and the structure of complex social processes such as social mobility and economic growth. Campbell argued that these and other inferred entities are known indirectly and vicariously, through a process of pattern matching (Campbell 1966). He also contended that case studies can be a methodologically powerful form of pattern matching in the social sciences (Campbell 1975).

THE SOCIOLOGY OF SCIENTIFIC VALIDITY

Traditional sociology of knowledge, because it describes the social, political, and cultural conditions affecting science and other knowledge formations, is descriptive. Campbell’s sociology of knowledge, which goes beyond description, sought to explain how differences in the social structures and processes of sciences affect the degree of validity achieved by those sciences. He called this normative sociology of science the sociology of scientific validity (Campbell 1986). Among the social factors that affect scientific validity are institutional incentive systems that reward quality research and punish those whose research is flawed by violating norms of science.

PRIMARY SOURCES

Cannibalism

The belief in the existence of man-eaters just beyond a culture’s boundary is a time-honored and cherished notion for many parts of the world. In what we call advanced societies, such as our own, cannibals are thought to inhabit the remaining mysterious distant fringes of civilization such as the highlands of New Guinea and the rain forests of the Amazon. There, the inhabitants with a more limited view of the world suspect cannibals in the next valley or around the bend of the river. How and why this imagery came into existence and continues to be so compelling for both the lay public and academics alike is as debatable as it is apparent.

No better example of the longstanding Western proclivity to label distant people as cannibalistic can be found than in the work of the fifth century BCE Greek traveler Herodotus, the father of history and anthropology. Not far from the limits of Hellenic culture in an area we now recognize as central Asia, he noted (in *Herodotus: A New and Literal Version*, 1879) that “beyond the desert Anthropophagi dwell, … the only people that eat human flesh” (pp. 243, 273.) With these characteristic remarks, the author of the first account of exotic peoples set the paradigm generally employed over the succeeding centuries: First, those who did not share Western culture, those both different and inferior, are *the other*; and second, they were often labeled sight unseen as man-eaters.

This theme was repeated in some of the classic Roman texts and then later by medieval travel accounts of the then known world. Over time, many peoples, such as the Irish and the Scots, as well as the European Jews and North African Muslims, were cast by one or another obscure writer as consumers of human flesh. Eventually, the list of itinerant raconteurs included the famous Marco Polo, who in the late fourteenth century claimed to have traversed the Eurasian continent from Venice to China before residing there for a number of years.

Although the veracity of his account is now debated, what is significant is his report of unobserved cannibals on Jipangu (Japan) on the border of Kubla Khan’s Mongol empire. A copy of this text, which even then was popular, was later in the library of Christopher Columbus and also occupied his imagination as he sailed into the New World while erroneously assuming he was on the eastern border of the Old World. Believing that he was in the vicinity of Jipangu, the admiral also recorded an encounter with cannibals in what was actually the Caribbean, probably in the vicinity of Cuba. Thus, for the first time contact with the rumored man-eaters was made, and the word *cannibal*, a Spanish derivation of Carib, entered the lexicon to replace Anthropophagi. Although the suspected cannibals were then seen, the act of cannibalism continued to go unobserved. This new context necessitated a revision of the ideological paradigm, which now assumed that the custom was repressed by conquest. There were also more profound practical implications, for at the time those degenerate enough to eat their own kind could be enslaved. In subsequent eras the label legitimized conquest and colonization as Western nations came into contact with a host of far-flung would-be cannibals.

This assumption and powerful image of the other as cannibal remained a feature of Western ideology for some centuries until it was eventually challenged in *The Man-Eating Myth* (Arens 1979). A review of some of the literature on the most infamous reputed man-eaters from North America, Africa, and New Guinea led to the book’s conclusion that the idea of *gustatory cannibalism*—that is, an activity engaged in on a regular basis with social approval—could not be substantiated by the usual standards of academic inquiry.

The initial negative reaction to the conclusion, most explicit in a series of essays by cultural anthropologists (Brown and Tuzin 1983) has gradually lessened over time. Once the question whether it could be that so many, if not

**SECONDARY SOURCES**

most, people of color were cannibals until contacted by white Europeans was explicitly framed for debate, it became intellectually and politically untenable in the postcolonial era to maintain what was formerly an implicit affirmative conclusion. There was also the eventual realization that the proposal did not rule out *survival and ritual cannibalism*. This new perspective, though, leads to related issues regarding how those implicated in this sort of activity are labeled, and then how to define *ritual* in a consistent manner.

As for the consumption of human flesh under dire conditions, it has been long recognized that this behavior is possible in any culture. This impression is substantiated by European shipwreck tales, as well as by the Donner Party incident when the party’s members survived on the remains of their compatriots while stranded in California’s Sierra Nevada Mountains in 1846. In no instance are those implicated—the French, the English, and Americans—subsequently labeled as *endo-cannibals*, eaters of their own kind. Similarly, this behavior may have been characteristic of, for example, the Inuit or other Native Americans, as deduced from historical sources or archeological evidence, such as that reported in Billman, Lambert, and Leonard’s (2000) detailed article about the Mesa Verde region in the twelfth century. However, these groups are not stigmatized as cannibals by the general public. These contradictory impressions are objectively unacceptable.

The issue of *ritual* cannibalism is more complicated. Desiccated human body parts were sold as remedies for various human ailments by European and American apothecaries until the early twentieth century (Gordon-Grube 1988); some American food cultists advocate the consumption of the human placenta (Janszen 1980); and there is the use of human cadaver extracts in contemporary biomedicine, presumably to capture the strength of the deceased. These domestic customs may be considered bizarre, misguided, or even guided science, but they are never labeled ritual cannibalism. However, South American groups reported to consume the ashes of the dead for whatever reason are ipso facto deemed ritual cannibals. Again this situation is intellectually unacceptable and hints at cultural discrimination.

A recent consideration of the issue in Gananath Obeyesekere’s *Cannibal Talk* (2005) recommends that we reserve the term *cannibalism* for the irrational fear that the other wants to eat us and use the term *anthropophagy* to refer to the actual practice in ritual and survival contexts. Perhaps it would be simpler to conclude that there are no cannibals in the sense of how the situation was once subjectively viewed; alternately, from a more objective contemporary perspective, we could all be cannibals. What is more obvious is that the cannibal epithet, as leveled by one culture against another, is more common than the deed itself.

**CANTILLON, RICHARD**

c. 1680–1734

Richard Cantillon was an Irish banker and economist who emigrated to Paris, where he profited from the financial scheme known as John Law’s Mississippi bubble (1720). His lone surviving book, *Essai sur la nature du commerce en général* (Essay on the Nature of Commerce in General) was written around 1730 and circulated in manuscript form for a quarter century in France until it was published anonymously in 1755. Legend has it that Cantillon was murdered in London, although his biographer, Antoin Murphy, convincingly hypothesizes that he staged his murder and left the country to avoid impending legal battles.

Cantillon’s *Essai* is often considered a product of his financial exploits because it contains a defense of usury that justifies charging illegally high rates of interest. It also contains an analysis and condemnation of what caused the Mississippi bubble. But it is much more than a mere posi-
When the economist William Stanley Jevons (1835–1882) rediscovered Cantillon's Essai in 1880, he called it the “cradle of political economy” and “the first treatise on economics.” The English translator of the Essai, Henry Higgins (1864–1940), wrote that Cantillon was “the economist’s economist.” Joseph Schumpeter (1883–1950) labeled the Essai the first “bird’s-eye view of economic life” Schumpeter (1954, p. 222), and Murray Rothbard (1926–1995) dubbed Cantillon “the founding father of modern economics.” Antoin Murphy concluded that the Essai has “stood the test of time and is of increasing interest to modern-day economists.”

Cantillon’s contributions to economics include critical aspects of methodology, such as the use of ceteris paribus, price and wage determination, the crucial role of the entrepreneur, the circular-flow nature of the economy, the price-specie flow mechanism, the function of money, and the problems of inflation. He showed that wealth was determined not by money but by the ability to consume, and that the source of wealth was land and productive labor. He demonstrated that saving and investment were critical to productivity and higher wages, and he maintained that in the absence of government intervention, markets—including the market for loans—would be regulated by competition. He also analyzed the forces that cause business cycles and stock market bubbles. It has been asserted that Cantillon’s puzzling use of the term intrinsic value now represents the discovery, 140 years prior to its conventional dating, of the concept of opportunity cost, by means of which the economist analyzes not just the ticket price of a good, but the full cost to the decision maker, including his or her time.

Despite its relative obscurity, Cantillon’s Essai was very influential. It provided a major stimulus to the founding of the physiocrat school in 1757. There is now strong evidence that it influenced David Hume’s (1711–1776) economics. Adam Smith (1723–1790) referred to Cantillon in the Wealth of Nations (1776), where even the invisible hand is evocative of Cantillon. There are also strong parallels between Cantillon and Charles Louis Montesquieu (1689–1755), Etienne Bonnot de Condillac (1715–1780), Anne Robert Jacques Turgot (1721–1781), and Jean-Baptiste Say (1767–1832). Thus, Cantillon foreshadowed the physiocrat and classical schools of economics and the economics of the French Enlightenment.

### CAPACITY, FULL

**SEE** Full Capacity.

### CAPITAL

*Capital* can mean many things, including a sum of money, an invested fund, a set of produced means of production, or human skills (“human capital”). In the theory of production, distribution, value, and growth, the term *capital* refers to capital goods or investment goods and skills. In this perspective, capital is an accumulable factor of production, as opposed to land and simple labor, which are not. The means of production encompass raw materials, tools, and instruments of production, and in the writings of some earlier authors also the means of subsistence enabling workers to perform their tasks. To the extent that natural resources, such as land, first have to be brought into a form that can be used productively, the investment in these resources and the resources themselves become amalgamated into what Karl Marx (1818–1883) referred to as “la terre-capital” (land-capital).

Capital in the sense of capital goods is typically grouped in broad categories, including the following. *Circulating or working* capital refers to capital goods advanced at the beginning of the period of production that contribute exclusively to the period’s output: they “disappear” from the scene at the same time as their value is transferred to the product. *Fixed* capital, in contrast, refers to capital goods that are long-lived and cannot be traced on a given unit of output. In their case, the idea of a material-cum-value transmigration into the product seems to lose any foundation. However, as was suggested already at the time of the classical economists and was rigorously shown by the mathematician John von Neumann (1903–1957) and the economist Piero Sraffa (1898–1983), a coherent treatment is possible using a joint-products framework: a fixed capital item that enters production at the beginning of the production period is considered a different commodity from the item that exits...
at its end. In this way, fixed capital can be reduced to cir-
culating capital.

In Marx we find the distinction between constant and
variable capital: the latter refers to raw materials, tools, and
instruments of production and represents dead labor; the
former refers to wage goods spent in employing living
labor, which, according to Marx, is the sole creator of
value. American economist John Bates Clark (1847–1938)
distinguished between capital and capital
goods, the former being a fund of value earning its owner
a return, interest, which equals the marginal productivity of
capital.

As these examples show, a main issue in capital the-
ory is whether capital is “productive” in the sense that it
explains the existence of profits or interest. Critical reviews
of early profit theories were put forward by Marx
(1905–1910) and the Austrian economist Eugen von
Böhm-Bawerk (1884). These authors developed their own
approaches against the background of the earlier literature.
At the cost of severe simplification, the various tradi-
tions in the theory of capital and distribution may be
divided into two principal groups, one rooted in the sur-
plus approach of the classical economists, the other in the
demand and supply approach of the marginalist authors.
Both traditions developed their arguments essentially
within a long-period general framework of the analysis
centered on the concept of a uniform rate of profit (or interest) and the corresponding set of normal prices.

The classical authors explained profits in terms of the
surplus product left after the means of production used up
in the course of production of given outputs in the system
as a whole and the means of subsistence in the support of
workers had been deducted from these outputs. Given
wages are thus a characteristic feature of the early classical
economists’ approach. (The level of wages was then dis-
cussed in another part of the theory, typically by taking
into account, for example, whether the society was
“improving” or stagnant.) Production was conceived as a
circular flow involving a strong degree of interconnected-
ness of the different industries of the economy. The rate of
profits, expressed in material terms, is the ratio between
the social surplus and social capital, that is, two aggregates
of heterogeneous commodities. A comparison of these
two vectors necessitated the development of a theory of
value. The classical economists tried to tackle this problem
typically by first identifying an “ultimate measure of
value,” which was designed to render heterogeneous com-
modities homogeneous. Several authors, including David
Ricardo (1772–1823) and Marx, then reached the conclu-
sion that “labor” was the sought standard and therefore
advocated some version of the labor theory of value. By
means of this theory, some of these authors, in a first step,
determined the rate of profits and afterward, in a second
step, used their finding to determine normal competitive
prices. Ladislaus von Bortkiewicz (1868–1931) aptly
called this approach successivist.

Yet, as Sraffa showed, the successivist approach can-
not generally be sustained: “the distribution of the surplus
must be determined through the same mechanism and at
the same time as are the prices of commodities” (1960, p.
6), that is, simultaneously. The classical authors did not
have the instrument of simultaneous equations and the
mathematics needed in order to solve them at their dis-
posal. This helps to explain why they had recourse to the
labor theory of value. This landed them, in the case of
Marx, in the (infamous) problem of the “transformation”
of labor values in prices of production. Commodities were
produced by means of commodities and there was no way
to circumnavigate simultaneous equations. Sraffa showed
that a coherent formulation of the classical approach that
was independent of the labor theory of value was possible:
The rate of profits and competitive prices could be deter-
dined consistently in terms of the givens of the problem
under consideration: (1) the system of production in use,
characterized by the dominant methods of production
employed to produce given gross outputs; and (2) the ruling
real wage rate(s), or the share of wages.

The alternative marginalist explanation traced profits
back to the productivity-enhancing effect of the use of
capital goods. It consisted essentially of a generalization of
the principle of intensive diminishing returns in agricul-
ture indiscriminately to all industries and all factors of
production alike. The older marginalist authors, with the
exception of the French economist Léon Walras
(1834–1910), were aware of the fact that in order to be
consistent with the concept of a long-period equilibrium,
the capital endowment of the economy could not be con-
ceived as a set of given physical quantities of heteroge-
nous capital goods, but had to be expressed as a value
magnitude: its commodity composition was seen to be a
part and parcel of the equilibrium solution, determined
by (1) preferences, (2) the technical alternatives from
which cost-minimizing producers can choose, and (3) ini-
tial endowments of the economy of labor, land, and “value
capital.” The formidable problem for the marginalist
approach consisted in the necessity of establishing the
concept of a quantity of capital, which could be expressed
independently of the price of its service, or the rate of prof-
its, and whose relative scarcity then determined that rate.
If such a concept could be shown to exist, profits could be
explained analogously to intensive rent on homogeneous
land, and a theoretical edifice could be erected on the uni-
versal applicability of the principle of demand and supply.

Doubts as to the sustainability of this concept had
already surfaced at an early time, and had prompted some
authors such as Friedrich August von Hayek (1899–
1992), Erik Lindahl (1891–1960), and John R. Hicks (1904–1989) in the late 1920s and early 1930s to abandon the long-period method and adopt instead temporary and intertemporal equilibrium methods (Garegnani 1976). Yet it was only during the so-called Cambridge controversies in the theory of capital in the 1960s and 1970s that the concept was conclusively shown to be untenable in general (see Garegnani 1970; Kurz and Salvadori 1995, chap. 14). The concept can only be used in exceedingly special cases, and it is ironic to see that these are precisely those cases in which the labor theory of value applies. Despite these findings, the concept is still widely employed, in much of macrotheory, for example, with its reliance on the (infamous) aggregate production function. In more recent times, temporary and intertemporal models have also come under attack (see the contributions by Pierangelo Garegnani and Bertram Schefold in Kurz [2000]).

With the process of globalization going on, there is a tendency toward an internationalization of capital and the worldwide equalization of the rate of profits. An analysis of the factors affecting this rate is an important task in contemporary accumulation and growth theory.

**CAPITAL CONTROLS**

Capital controls are the legal and quasi-legal regulations that govern the movement of capital (money, credit and
other financial assets; direct investment, and capital goods) across national borders, to restrict or stimulate outflows or inflows, particularly speculative and abnormal flows, of capital. In short, capital controls are government practices that influence the volume, direction, character, and/or timing of short- and long-term capital transfers. The capital control regulations a government uses are categorized into four types: foreign exchange regulations (and exchange rate regimes); tax and revenue-generating policies (surcharges); investment and credit regulations; and trade or commercial restrictions. The status and enforceability of capital controls range from official/legal restrictions that are fully enforceable (if the administration desires), to bureaucratic restrictions left to the policies and discretion of regulatory agencies (and their resources), to social/customary restrictions that are enforced more through custom, cultural mores, and goodwill between the parties than any explicit law or policy.

PURPOSES, USES, AND FUNCTIONS
Although often maligned as counterproductive or ridiculed as ineffective, capital controls are used more than trade restrictions, and have been used throughout economic history by almost every country. Countries use capital controls for various purposes and for a wide variety of reasons, in particular to lessen the effects of volatile disequilibrating capital flows; to lessen capital flight; and to protect infant industries. Justifications for the use of capital controls include sheltering or isolating a country from volatile capital movements; saving foreign exchange and keeping domestic and foreign finances under national control; facilitating domestic full employment; forcing repatriation of nonreported capital; and generating government revenues.

In twentieth-century history the worldwide financial instability of the 1920s and 1930s led many economists and policy makers to advocate the use of capital controls. In the early 1930s, the English economist John Maynard Keynes was a strong proponent of capital controls and argued for their international institutionalization with the establishment of the International Monetary Fund (IMF) at the Bretton Woods conference in 1944. The IMF charter included a compromise, accepting the use of capital controls, particularly on capital account transactions, under specific conditions with a finite timetable, but promoting the principles of free trade.

Studies that have examined the use of capital controls find them to have helped countries control capital flight, maintain the desired exchange rate and desired level of international reserves, reduce exchange and interest rate volatility, retain domestic savings and protect labor’s wage share, increase government revenues, and maintain the domestic tax base.

In her Capital Control, Financial Regulation, and Industrial Policy in South Korea and Brazil (1996) Jessica Gordon Nembhard explained that capital controls have a purpose within a country’s development plan, in particular as the apex of a triad of complementary industrial development policies including credit controls and government entrepreneurship and economic planning. During the 1980s both the Republic of Korea (South Korea) and Brazil, for example, used similar financial strategies to encourage and support industrial development. These policies included capital controls, credit controls and preferential credit allocation, fiscal incentives, and trade restrictions to both control and reward the domestic public and private sectors for following the national development plans. There were structural differences, however, between the level of financial control, the types of restrictions used, and the two countries’ abilities to effectively implement and maintain policies and planning efforts. The Republic of Korea was more successful than Brazil because of the specific types and configuration of controls used, the high level of financial control held by the state, the comprehensiveness of the coordination of government planning, and the administrative skills and consistency of implementation and enforcement exhibited by the Korean bureaucracy. South Korea had a more commercially open but financially closed economy. This combination worked well for many years.

CONTEMPORARY UTILIZATION OF CONTROLS AND TRENDS IN USE
Even with the international pressure for liberalization of capital controls coming mostly from the United States and the multilateral organizations such as the IMF and the World Bank, at the end of 2000 97.8 percent, or 182 of the 186 member countries of the IMF, maintained some level of restriction on capital account transactions (Monetary and Exchange Affairs Department [MEAD] 2003, p. 43). Most widely used restrictions were on transactions by commercial banks and other credit institutions, foreign direct investment, and real estate transactions. This was an increase in capital account restrictions from the 180 in 1997 and the 136 of 178, or 77.5 percent, of members in 1992. In addition, 133 countries, or 71.5 percent, continued to have controls on current account transactions in 2000 (MEAD 2003, p. 55), an increase from the 92 or 51.6 percent of countries in 1992. Most widely used were controls on import payments and on export proceeds, although few countries classified as “advanced” used current account restrictions. Among the group of countries categorized as “less developed” or “developing,” use of controls actually increased between 1975 and 1989, when many European countries (members of the Organization for Economic Cooperation and Development [OECD])
were reducing their use of controls, and were maintained for the most part (with some fluctuation) throughout the 1990s.

According to the Monetary and Exchange Affairs Department of the IMF (2003), between 1997 and 2001 the “momentum of liberalization” slowed even though financial globalization continued and exchange rate regimes tended to move toward greater flexibility. MEAD found an increased use of certain types of capital controls on selected capital transactions such as those affecting institutional investors. MEAD suggested that countries become increasingly concerned with “risks associated with capital account liberalization following a series of crises in emerging market economics,” which may explain the increased use of restrictions (MEAD 2003, p. 40).

LIBERALIZATION, ARGUMENTS AGAINST, AND THEORY OF THE SECOND BEST
Arguments against capital controls based on traditional economic theory assume that unrestricted capital movements and free trade are Pareto optimal (perfectly competitive) in a Walrasian economy. Restricted financial markets are assumed to be inefficient, to distort capital movements and to impede economic growth, because they misallocate resources, reduce investment opportunities, and hamper exchange rate flexibility and other automatic stabilizers. In addition, capital controls are considered ineffective because it is assumed that they cannot be enforced and only autarkic countries use them. Black markets, usury, and other illegal exchanges are presumed to be the evidence of inefficient markets and lack of enforceability. Governments, organizations, and scholars interested in promoting international economic integration, and the right of the owners of capital to take their resources and make their profits anywhere, support liberalization or easing of capital restrictions. Countries are supposed to use exchange rate and interest rate adjustment (flexible rates and devaluation) to address volatile capital movements and not use capital controls.

In traditional models capital controls are sometimes justified as a second-best solution in the face of temporary rigidities or distortions in the market, such as when it is necessary to defend an exchange rate disequilibrium, or when equalizing domestic with world interest rates limits the effectiveness of national monetary and fiscal policies. Some studies find that capital controls work well in the presence of other protectionist policies. Capital controls can, or should according to theory, be lifted or liberalized when the other distortions are removed, once a country’s economy is more advanced, and/or in order for a country to join the world economy and open up its markets. Proponents of capital controls find that the distortions and inequities are not temporary conditions, but perpetual market failures that require intervention. Empirical studies find that the use of controls continues. Restrictions on capital accounts can be rational and effective, evasion can be mitigated, and enforcement strengthened, especially when they are part of a set of strategic economic development policies.

BIBLIOGRAPHY

Capital Flight

Capital flight is generally defined as an outflow of funds from a country motivated by an adverse change in the country's economic, political, or social environment. Some believe that this definition is too broad. They distinguish between outflows that reflect “normal” international diversification motivated by marginal changes in risk-adjusted returns and funds fleeing or propelled across national borders during a crisis. According to this view, only the latter category represents true capital flight. Related definitions restrict capital flight to short-term speculative outflows—“hot” money—or to an outflow of illegal transactions only. Some studies distinguish between the determinants of the outward flow of funds and those of the accumulated stock of capital flight over a period of time. To a great extent, the precise definition of capital flight used in any study is determined both by the purpose of the study and the available data.

Developmental economists tend to define capital flight broadly as the net unrecorded capital outflows for any reason from any capital-poor developing country. Other critics argue that this use of the term is more of a judgment than a definition—that capital flight is just a pejorative term for international diversification by a developing country. Defined in this way, capital flight presents developmental economics with a paradox. It is often observed that residents of a developing country engage in capital flight at the same time that entities in high-income countries are lending to or investing in the same developing country. How can both of these decisions be rational?

BURDEN OF CAPITAL FLIGHT

If the scale of capital flight is large enough, it will have both short-term and long-term adverse impacts. An example of the former is the sharp increase in capital flight during the Asian financial crisis of the late 1990s. The ability of countries in the region to deal with the bursting of domestic asset bubbles was severely constrained not only by a rapid and large outflow of capital but also by the necessity to immediately impose higher interest rates and capital controls in an attempt to slow the capital flight, even though these policies worsened the domestic situation.

In the long-term, capital flight tends to reduce gross domestic product (GDP) growth. Especially in developing countries, domestic savings diverted into foreign holdings will not result in domestic investment. This is especially harmful because the marginal social benefit of investment in such countries tends to be greater than the marginal private benefit. Capital flight is also generally associated with an increase in a country's foreign debt. Furthermore, the possibility of capital flight limits a government's policy choices, as some monetary and exchange-rate policies will lead to an acceleration of such flight.

In addition, capital flight tends to not only shrink a country's tax base but also make taxes less progressive. Wealthier families tend to have more opportunities to hide their funds abroad in order to conceal them from the tax collector. Capital flight facilitates corruption by providing concealment and sanctuary for ill-gotten gains. Finally, the possibility of large-scale capital flight discourages aid from international organizations and investment from other countries.

ESTIMATING CAPITAL FLIGHT

Capital flight involves a balancing of secrecy, expected returns, and risk. Attempts to increase the secrecy of capital flight, perhaps to avoid detection by a tax authority, tend to reduce return or increase risk. This necessary compromise increases the likelihood that capital flight will leave indirect evidence. While there are many methods of estimating capital flight, most are variations of either the balance of payments method or the residual method.

The balance of payments method assume that the most important characteristic of flight capital is that it is “hot” money. Small changes in perceived returns or risks could result in a rapid discontinuous transfer of funds moving out of the country. This wave will come to an end when investors have adjusted the share of each country's assets in their portfolios based on the new perceived return/risk profile. Based on this characteristic, the balance of payments estimate of capital flight is equal to the sum of (1) reported short-term capital exports by the
nonbank sector and (2) the balancing entry, errors, and omissions. The inclusion of the latter reflects the belief that errors and omissions are largely composed of unrecorded short-term capital flows.

A more widely accepted method of estimating capital flight concentrates on capital flight as a residual. The current account balance, changes in international reserves, and the amount of net foreign direct investment determine a country’s necessary amount of international borrowing. If actual foreign borrowing exceeds this necessary amount, then it is assumed that the difference (or residual) represents additional borrowing to offset capital flight. The balance of payments method and the residual measure tend to provide a similar rough guide to the pattern of a country’s capital flight, but the residual method usually results in larger estimates of the size of these outflows.

Most studies of capital flight adjust their estimates to reflect the unique characteristics of each country both with respect to the treatment of foreign financial assets and liabilities, and the possibility of misinvoicing. Not all foreign financial assets are taken as evidence of capital flight; some may be necessary to facilitate foreign trade and finance and will have been reported to the developing country’s government. These “legitimate” foreign financial assets are often subtracted from capital flight estimates. Another common adjustment is to use creditor data to fill gaps in a country’s foreign debt statistics.

A more important adjustment is to correct for deliberate trade misinvoicing used to circumvent trade controls, avoid import tariffs, or facilitate capital flight. A resident may under invoice his exports and then direct the unreported difference between the invoice amount and his actual receipts to some financial haven. Under invoicing of exports (or over invoicing of imports) widens the reported trade deficit and therefore reduces the residual estimate of capital flight. Counterpart data can be used to correct for misinvoicing. The export (or import) numbers of a country are replaced by the import (or export) numbers, adjusted for the cost of insurance and freight, of any of its trading partners that are believed to publish more reliable trade data.

DETERMINANTS OF CAPITAL FLIGHT

There is no consensus on the primary determinants of capital flight. The most widely held view is that capital flight results from attempts by portfolio holders to maximize risk-adjusted returns. The optimal portfolio will be based on the differential between domestic and foreign interest rates, beliefs about the relative over- or undervaluation of exchange rates, and expectations of monetary and credit policies at home and abroad as well as the relative risks that investors face in both countries. If one of these variables shifts in favor of another country, capital flight will occur. However, if the shift is in favor of the home country, there will be a repatriation of flight capital.

The simple portfolio model fails to explain the paradoxical situation in which portfolio holders in a developing country engage in capital flight at the same time that portfolio holders in high-income countries are investing in the country. One explanation is that domestic and foreign portfolio holders face discriminatory treatment—that is, they face different risks or returns. A developing country may provide tax benefits to foreign investors from high-income countries, or these investors may believe that they face less risk of an adverse change in regulation because of the implied protection of their home governments. As discussed below, this differential in benefits may lead to round-tripping or revolving-door transactions.

Transaction costs may provide another explanation of this paradox. Transaction costs include the costs of gathering accurate information about an asset or liability, finding and evaluating the other parties involved, negotiating an agreement, and possibly enforcing this agreement. In well-developed financial markets, transaction costs tend to account for only a small fraction of the value of a financial transaction, and the costs associated with international transactions tend to be higher than those associated with domestic ones.

However, in developing countries, neither of these assumptions is necessarily true. Developing countries tend to have a lower capital/labor ratio than high-income countries, and therefore the real return on capital in developing countries should be higher. However, the existence of large transaction costs may motivate portfolio managers in developing countries to split their holdings based on desired maturity. Short-term holdings will be invested internationally where transaction costs are lower (capital flight). However, long-term holdings, with a desired maturity long enough to amortize higher transaction costs, will take advantage of the higher real return and be invested at home. Therefore domestic and foreign investors with a long enough maturity preference may be willing to invest in a developing country experiencing capital flight.

Capital flight and external borrowing tend to be highly correlated for a variety of reasons. Both may simultaneously increase as a reaction to poor economic management. Foreign borrowing may cause capital flight by increasing the likelihood of a debt crisis and therefore increasing economic uncertainty. Capital flight may cause foreign borrowing in order to replace lost capital and foreign exchange. Foreign borrowing may occur to provide the funds for capital flight. Finally, round-tripping or revolving-door transactions may simultaneously increase
both flight and debt. Round tripping occurs when portfolio holders in developing countries send funds to foreign banks with the understanding that these banks will lend these funds to entities in the less-developed countries controlled by the portfolio holders. The usual motivation for round tripping is to take advantage of government guarantees for foreign loans.

Corruption, the abuse of public power for private benefit, is often associated with capital flight because corruption increases the risk of investing in a country. Also individuals may send funds abroad to hide them from corrupt government officials, and these officials may illegally shift funds abroad to launder the bribes that they received. Foreign banks may also facilitate capital flight by either lending to corrupt governments in return for generous fees or providing special saving facilities to help corrupt officials hide their loot. In addition, studies have found that capital flight tends to be a function of past capital flight, the general macroeconomic environment, and political factors, such as political instability and poor governance.

**CAPITAL CONTROLS AND OTHER MEANS OF REDUCING CAPITAL FLIGHT**

Capital controls seek to reduce capital flight by reducing its risk-adjusted returns. When controls are enforced, financial or trade activities associated with capital flight may require additional documentation, permission, fees, or the posting of bonds. Despite the widespread use of capital controls, they appear to be more effective as a means of slowing capital flight rather than of preventing it entirely. The value of capital controls is that by acting as a speed bump they provide decision makers with time to decide on policies, coordinate their efforts with international organizations such as the International Monetary Fund, and execute policies effectively before uncontrolled capital flight brings about a financial collapse.

However, there are at least four reasons why capital controls may fail to reduce net capital flight—capital flight minus repatriation—in the long term. First, imposition of capital controls may be a signal that a government intends to adopt perverse fiscal or monetary policies. Second, before they will repatriate existing flight capital, portfolio holders will now require a higher degree of confidence in future relative risk-adjusted returns because new controls will make future capital flight more difficult. Third, reporting requirements, currency controls, enforcement procedures, and bureaucratic influence intended to prevent capital flight may significantly reduce the risk-adjusted return on domestic investments. Finally, imposition of a particular set of capital controls may simply encourage a search for new methods of capital flight. This policy-avoidance response may be as simple as bribing a new official, or it may shift capital flight into an entirely different channel. The longer capital controls are in place, the less effective they become.

A long-term strategy for reducing capital flight should focus on getting the economic fundamentals right. In addition to achieving reasonable exchange and interest rates, the adoption of a pro-growth economic policy may be the most important way to reduce capital flight and encourage repatriation. In developing countries, an aggressive anticorruption effort should also be a part of any pro-growth policy.

CAPITAL THEORY
SEE Capital.

CAPITALISM
Capitalism, first used as a term by Werner Sombart around the beginning of the twentieth century, is a social system dominated by economic relations, particularly market relations. The institution of private property is elaborately developed and well secured, and property owners derive income from the sale of output made with labor hired for wages or salaries. The income of property owners can appear as profit, interest, or rent, depending mainly on the kind of property involved. Workers have little or no income-earning assets other than their capacity to labor, which they contract to sell to property owners (capitalists) for a definite period of time but not for a definite intensity. Property income may be increased by getting workers to increase the intensity of labor, that is, to work harder, faster, or smarter.

Although markets existed in a great variety of social systems, appearing back to the furthest extent of recorded history, capitalism is unique in the degree to which market relations affect every aspect of the social order. According to Karl Polanyi in The Great Transformation (1944), the rise of capitalism represents a major institutional reversal. Precapitalist societies often provided for markets within an elaborately structured cultural framework, in which social status and social roles were already established, such that markets played a decidedly subordinate role. Trade and traders had their place, often clearly delimited in time, space, and permitted function. Under capitalism, in contrast, the market itself increasingly provides the framework for the determination of social status and social roles; market relations increasingly determine the time, space, and function of every other aspect of the culture. Cultures are modified and subordinated to global markets, creating a world system beyond any single culture’s design.

RESOURCE MARKETS: LAND AND LABOR
Specifically the rise of capitalism involves legal developments allowing for efficient markets for land and other natural resources. The sovereign rights of the state and the blood rights of family, clan, and tribe—whatever these may include—become limited and clearly distinguished from modern property rights, so that real estate and rental markets as well as more esoteric markets in mineral rights may thrive unencumbered by ambiguities and restrictions of tradition.

Similarly efficient labor markets are developed to accommodate wage labor on a massive scale that transcends or escapes human relationships based on tradition, intimate acquaintance, or direct coercion. In practically all precapitalist societies, there are some kinds of “subsistence” activity—perhaps in hunting, gathering, farming, fishing, or herding—to which almost anyone could turn for a living in default of any more exalted assignment or organized function. In developed capitalist societies, there is no default living. Access to requisite land or natural resources is not free and not otherwise institutionally guaranteed. Significant property ownership is neither universal nor necessarily even widespread in the population. In fact in the long actual history of the establishment of legal private property in its modern form in many countries, the bulk of property, through force and fraud, came into the hands of old elites and entrepreneurial upstarts, leaving most people without property and without legal access to resources or means of production. Hence involvement in market relations and in social networks becomes inevitable, and that presents a distinct set of challenges to the propertyless, more or less forcing many of them into the labor market and into a weak bargaining stance vis-à-vis the owners of property rights in the means of production.

An essential insight in Karl Marx’s Capital (1867) is that the captive excess supply of labor, or in Marx’s vivid terms the “reserve army of labor,” creates a competitive environment in which workers can be expected to be compliant and wages are negotiated down to subsistence level. Specifically wages are not expected to bear any particular relation to the value of goods produced and sold by the employer-owners, and that provides a nonfleeting source of profitability. Thus Marx demonstrated that regular profit can come from property ownership in the means of production, even if those means of production are themselves produced entirely by workers.

Naturally the state of the capitalist labor market presents some glorious opportunities to employers, but it also presents challenges. Mere biological subsistence turns out to be quite distinct from maintenance of healthy, reliable, motivated, and skilled employees. To the extent that employers scan their labor supply for quality as well as quantity, they seek a labor market different in structure from that envisioned by classical and Marxist economists. As the experience of industrialists from Robert Owen in the 1820s to Henry Ford in the early 1900s repeatedly illustrated, it can be profitable under certain circum-
stances to invest more in the labor force, paying workers more than is customary or appears necessary in terms of current labor market conditions. This insight gave rise to the concept of human capital, according to which investment in workers can yield a return as readily as might investment in any other kind of productive equipment; to human resource management, including elaborate segmentation and structuring of the labor market; and finally to a variety of state-sponsored programs socializing the cost and standardizing the practice of basic education, sanitation, health care, and other basic investments in the population thought to improve the overall efficiency and productivity of labor. In short, actual labor markets fail to correspond to the classical vision to the extent that labor power cannot be merely "reproduced" in families outside the market, as in the Marxist model, but requires capitalist or socialized investment for its construction and maintenance.

Another challenge facing employers is to manage workers and the work environment so that the potential for profit is actually realized. Employees rarely work at peak productivity on their own initiative based on their own organizational efforts, so investment in human capital does not in itself suffice to maximize productivity and profits. Hence the need for management to organize and supervise on behalf of the enterprise owners, and hence the constant struggle at the work site between management and labor.

**ENTREPRENEURSHIP AND THE BUSINESS FIRM**

Unlike in precapitalist cultures, the organizing principles of capitalism are abstract and general. Law is highly formal, aspiring to universal reach, and markets involve stereotyped interactions among anonymous participants. It is no coincidence that capitalist processes are often comprehensible as games, as witnessed by the elaboration of game theory and its rapid extension beyond political science to economics and sociology. This creates an environment uniquely amenable to entrepreneurship.

Of course entrepreneurship even as currently understood is omnipresent in all social orders. History is full of accounts of military adventurers, poseurs, prophets, travelers, and merchants who preceded the arrival of the modern capitalist epoch. Presumably no society could be so structured, so rigid and predetermined, existing under circumstances so regular and predictable, as to provide no space for the restless and adventurous to innovate through that recognizable yet undeterminable combination of design and accident. Yet modern capitalist society was the first to recognize entrepreneurship as a regular rather than extraordinary function in a wide variety of fields of endeavor. It is even encouraged.

Two aspects of entrepreneurship deserve particular attention for purposes of understanding capitalism. The first is risk taking; the second is innovation. A certain amount of risk taking is encouraged under capitalism simply through the institution of property. Legally well-defined property rights allow an unprecedented expansion of the credit system by allowing enormous amounts of value to be put at its disposal in the form of collateral without the items constituting that collateral having been withdrawn from current productive use.

Even more space for purposeful investment in potentially risky ventures is provided by the modern corporate structure of business firms responsible for the large majority of the value of goods and services produced each year. This structure has evolved to spread and limit risk and thus to encourage voluntary contributions of funds. The spreading of risk is accomplished by selling shares, each of which is typically a miniscule fraction of the firm’s total outstanding value and often fairly liquid—meaning that it can often be quickly sold if the need for cash arises. Limitation of risk is accomplished by the legal device of "limited liability.” The maximum an investor can lose, unlike in a sole proprietorship or normal partnership, and the maximum an investor can be held legally liable for by virtue of that kind of participation is the total value of shares he or she holds. By allowing small, limited bets on the future, the corporation encourages risk taking and provides resources for entrepreneurship.

In most societies innovation—anything new that disrupts or undermines traditional ways of doing things—is vigorously rejected, and that rejection is overcome only by enormous endurance and determination or by forcible imposition. Under capitalism, this resistance is diminished. Property is protected, but its market value is not guaranteed. According to Joseph Schumpeter in *Theory of Economic Development* (1911) and *Business Cycles* (1939), economic growth comes in waves of innovations, often revolving around some central innovation, such as alternating current, the internal combustion engine, or the microchip. The initial innovation may be accompanied by a flurry of activity amid limitless hopes and give rise to a boom, but then follows disappointment and more importantly the destruction (“creative destruction”—another term first used by Sombart) of value in now obsolete goods, equipment, technologies, and skills; this tends to lead to depression. Eventually the further spread of economic activity based on the innovation helps lead to a recovery, but these innovation-led developments would perhaps never occur were the way not first cleared during the depression by “creative destruction.”
Economists have come to view capitalism in three major ways. The classical and neoclassical schools emphasize the spread of market relations and describe efficiency gains expected as a consequence. Marxist and related schools (e.g., that inspired by Henry George’s 1879 Progress and Poverty) focus on power relations and class structures implied by the prevailing system of property rights and emphasize how those hamper the achievement of many of the goals typically viewed as part of social progress, such as greater equality, more democracy, and more security. The Austrian school, including Schumpeter, de-emphasizes efficiency and instead promotes the innovative potential of decentralized knowledge and action. Though property rights are formally protected, the value of actual property is freely created and destroyed in the course of progress.

**THEORETICAL CURRENTS**

**Early Approaches**

Black capitalism represented a change from the earlier stress on community-based development, citizen participation, community organizing, and collective strategies in the War on Poverty. In its late-twentieth-century form, it also was a Republican alternative to Democratic Party priorities that had emphasized broad-based spending on education, housing, training, and public works projects. Black capitalism eventually was embraced by many black activists who saw political potential in developing strong economic institutions, both for-profit and nonprofit. They considered businesses to be potential platforms for political action. Thus, black capitalism was warily and partially embraced by some black nationalists, some separatists, and by the Nation of Islam, as compatible with their distinct objectives.

Starting in the 1960s the federal government encouraged African Americans to develop businesses, and thousands were started, but their economic impact was small. Their slow growth led federal policy makers, politicians, activists, and business leaders to look for ways to accelerate the process by using direct government and private financing, and consulting assistance targeted to those businesses that had the greatest chance of growing into substantial companies. They also encouraged increased government and corporate purchasing as a stimulus to growth. By the 1980s success was judged by normal business criteria, rather than social criteria.

In the early phases of black capitalism (1965–1970), federal policy encouraged primarily retail and service businesses. The policy was implemented through direct government and guaranteed loans, government-sponsored management and technical assistance, and government purchasing, but results were small: The thousands of businesses started with the help of federal loans and technical and procurement assistance did not become a substantial factor in community development as was originally hoped. A new view emerged—that federal policy should emphasize the creation and development of businesses that stand the best chance of becoming large and competitive, and economically significant. The new approach promoted acquisitions of larger, going concerns, the creation of sizeable venture financing companies, and new, stronger banking relationships from mainstream credit sources. This approach helped individuals who had an idea but seldom the right experience, training, or capital to run a successful business. Later, a job creation rationale

**THEORETICAL CURRENTS**

**Capitalism, Black**

The term black capitalism, which came into frequent use in the 1960s, refers to an increased interest in business, investment, entrepreneurship, and, broadly, economic development as a component of an overall strategy of black advancement. It built on several centuries of interest among African Americans in business ownership and participation, which had been opposed and stifled by overt white opposition. It was seldom espoused simply as a desirable “free market” principle in its own right.

Michael J. Brun
The disappointing results from early efforts encouraged policy makers to look for better approaches. Federal practice moved upscale, to provide consistent profits. Finally, early skeptics of building truly strong competitive businesses continued to be resisted by policy makers and bureaucrats charged with making Federal programs work.

The policy was a hasty response to the political and social pressures of the poverty program era. But managerial inexperience, poor locations, faulty business planning, market inadequacies, and capital shortages led to business failures. Shoplifting, employee pilferage, and other crime also increased business costs and raised risks. Racially discriminatory lenders, investors, and purchasing officers in government and corporations also impeded progress. The policy was defective, and the results were poor. The small retail and local service businesses had lower than average revenues, high costs, inexperienced management, weak capital structures, and other competitive handicaps. They concentrated in low-growth and low-margin sectors, and provided little full-time employment. Typically, they had poor locations and limited access to the wider general market. Manufacturing companies were grossly underrepresented.

For gross comparison, “minority” business receipts in 1978 were $35 billion in a $2 trillion economy—2 percent of total receipts. The goal became to increase aggregate demand, with better federal government and corporate procurement policies, to lift “minority” receipts by 1982 to $75 billion in a $2.5 trillion economy, or 3 percent of total receipts.

**THE SHIFT TO SUCCESS**

By 1980 to 1985, several things changed. First, there emerged a pool of African American managers and entrepreneurs with MBAs from top business schools. Second, the federal government changed its practice on delivering technical consulting assistance. Previously, management and technical assistance had suffered because of political pressures to give contracts and grants for services to inexperienced or ineffectual local consulting organizations; the government began to give fewer but larger grants to the best of the consulting groups, and this paid off in better assistance to clients with demonstrated capacity to make consistent profits. Finally, early skeptics among the trade unionists and community activists, as well as among political Republicans and Democrats, came to recognize the value of a stronger African American business sector.

**Corporate Action** The disappointing results from early efforts encouraged policy makers to look for better approaches. Federal practice moved upscale, to provide financing for larger businesses, including in manufacturing, and investment in firms with the potential to become publicly held. These operations sometimes became African American–led through acquisition. This approach was implemented through expanded venture capital, investments in promising businesses, corporate spin-offs, strengthened African American banks, and the use of existing private and government programs to increase purchasing and subcontracting from minority companies.

This tactic of building on strengths helped more businesses to become significant and competitive. An additional effect was saved and new jobs when the companies were located in labor-surplus or distressed areas—primarily in northeastern and midwestern cities and rural areas—and might otherwise have closed or moved away. So this approach also served the interests of the Department of Housing and Urban Development, the Economic Development Administration, the Community Services Administration, and the Business and Industry Office of the Farmers Home Administration in the Department of Agriculture.

**Venture Capital** Another step that made black capitalism effective was the growth of venture-capital firms created by farsighted companies. Although they quickly evolved into private firms with no government funding, they began by using government funds provided by minority enterprise small business investment companies (MESBIC) programs.

In 1970 the government had initiated a venture-capital program, the MESBIC, which began as an outgrowth of the previously established small business investment company (SBIC) concept. MESBICs, like SBICs, ran into financial and operating problems during the early and mid-1970s, and many of their investments did poorly or failed, but they recovered and became increasingly important financing sources in major transactions.

The MESBIC program continued to evolve, and it became more attractive to corporate investors when legislation made it possible to leverage private participation up to four times with funds at less than market interest rates. Used imaginatively by corporate sponsors, the MESBIC program provided significant equity and debt to businesses that became reliable contractors, suppliers, customers, and partners. The new thinking was that private venture-capital firms, corporate venture groups, insurance companies, investment-banking firms, and commercial finance companies could, in the right circumstances, increase their participation in these business ventures as normal business practice.

The policy worked through a network of sources to find, screen, structure, and close substantial investments, especially in the acquisition of manufacturing businesses. In the early stages, companies acquired had annual sales averaging $3 million, and were purchased for an average of $1 million. In one case, a precision screw products
company was bought for $1.4 million, and a few years later, in 1978 it had sales of $3 million. The African American purchasers raised $30,000, and the remaining $1,370,000 was financed privately. This model became a basis for moving upscale and into the mainstream.

These business deals were notable only because they involved African Americans—such financings were normal in everyday business. The criteria used in selecting businesses for acquisition were not limited to specific industries or types of companies, though manufacturing was preferred. Tests of risk, profitability, manageability, and return on investment were applied. The pool of African American investor-managers remained a constraint. The flow of ventures and the availability of finances were greater than the supply of appropriate investor-managers. But the discrepancy narrowed as well-trained MBAs reached the career points where moving into these situations was appropriate.

Several major corporations established MESBICs and then capitalized them at higher levels—up to $10 million. These larger MESBICs were often industry specific. In some cases, they financed businesses that the sponsors felt could become consistent suppliers. In the entertainment industry, MCA had a MESBIC that financed entertainment-related projects and companies in music and records. MCA New Ventures and three other MESBICs put together a package of $5.3 million in cash, loans, and services for the record company T-Elect. With $7.5 million capitalization, the National Association of Broadcasters established a MESBIC that will work with the National Telecommunications and Information Administration of the Commerce Department and with the Federal Communications Commission to help African Americans acquire radio and television stations.

Ironically, MESBIC staffs—African American professionals—tended to approach investments more pragmatically than many white senior managers from sponsoring corporations. They continued to think in terms of social responsibility, and thus preferred deals that were most risky and least attractive according to normal investment criteria. Such differences in viewpoint led to conflicts: What was the real point—businesses that can grow and become competitive and profitable, or social tokenism?

Spin-Offs In the late 1970s government representatives met with senior managers of General Motors, Eastman Kodak, Bankers Trust, First Pennsylvania Bank, Chase Manhattan, Hewlett-Packard, Levi Strauss, Kaiser Aluminum and Chemical, and others to discuss selling corporate units. No deals resulted, but the meetings served the purpose of raising expectations about black capitalism.

Corporations were encouraged to sell units that could operate independently. Spin-offs and independent acquisitions were carried out as straight business transactions at market prices and with normal fees to brokers and private financial participants. No subsidies or contributions from the corporate sellers or other private parties were sought. Applicable federal, state, and local loan and guarantee programs were used to augment private financing.

Commercial Banks Another policy change toward African American business development was an effort to upgrade the 100 commercial banks. The Federal Reserve System, the Office of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Commerce Department worked to improve the management, staff efficiency, marketing skills, and permanent capital base of these banks. These banks grew, some by acquiring branches of major banks, during the consolidation wave of the 1980s.

Corporate Purchasing Another dimension was the growing interest from major corporations. The government encouraged purchases by providing operating grants to and encouraging corporate participation in the National Minority Purchasing Council (NMPC), which included many “Fortune 1000” companies. Through the NMPC, African American companies received $1.8 billion in purchases from corporate businesses in 1978, and this volume grew steadily over the next twenty-five years.

Government regulations and programs also encouraged or required purchasing, contracting, and subcontracting. For example, the government required companies bidding on government work worth more than $500,000 to “minority” subcontract participation. Opposition to this practice led to reversals in the courts, but it became normal business practice for many large companies.

The 8a Program Federal procurement was a key element in accelerating black capitalism. The Small Business Administration’s 8a program directed government contracts to “minority” businesses. In 1977, federal policy called for the rate of federal procurement from “minority” businesses to increase substantially, from $1.8 billion annually to $3 billion. Steady increases continued over the next twenty-five years, providing a substantial revenue base. Offices of Small and Disadvantaged Business Utilization (OSDBUs) in every federal agency institutionalized this policy and increased awareness of it among bureaucrats.

Black capitalism, and the policies that followed, were initially based on the mistaken assumption that the government could help cure poverty by transforming some of
the poorest into entrepreneurs and managers, almost overnight. A sober assessment of these policies led to new insights—that building on strength was a more sensible route. The managers and entrepreneurs in whom the government and private investors invested emerged as the kinds of people whom venture capitalists and other private financiers normally bet on. The approach, thus, called for specially designed government loans and other such financing only to the extent that these approaches were needed to reduce perceived risks stemming from businesses’ locations or other unusual characteristics. Another tool that stimulated acquisition opportunities was tax incentives to sellers. These tax code provisions stimulated many sales of businesses in the 1980s and 1990s. Together, these evolving techniques, practices, and strategies made possible the phenomenon that came to be known as black capitalism.

CAPITALISM, MANAGERIAL
Managerial capitalism emerged in the late nineteenth and early twentieth centuries in the United States, and challenged the traditional regime of personal capitalism, which was built on competitive interaction among small firms within industries. Managerial capitalism, dominated by big firms, prevailed during the 1950–1970 period.

As pointed out by Alfred Dupont Chandler Jr. (1984), despite differences in the pace, timing, and nature of change, large firms in the United States, Europe, and Japan tended to evolve according to a common pattern. They were characterized by what Adolph Berle and Gardiner Means (1932) identified as the separation between ownership and control. Dispersed ownership associated with the concentration of power in the hands of top management defines the managerial revolution (Chandler 1977). Managerial capitalism underscored the problem of controlling managers, who were shown to trade desire for growth against fear of mergers and takeovers. In this perspective, inspired by the institutionalist approach of Thorstein Veblen (in particular his 1921 work The Engineers and the Price System), John Kenneth Galbraith (1967) developed a vision of managerial capitalism as an economic system based on a logic of endless accumulation where firms are run by the real decision makers—the managers (who make up the technostucture)—and not by the capital owners. For Robin Lapthorn Marris (1964), the long-run growth rates of large-scale “managerial” corporations are determined by the financial and market environment, on the one hand, and by the interests of both managers and shareholders, on the other hand.

While large conglomerates and powerful industrial groups were emblematic of affluent economies, social problems were raised, particularly in the United States. William A. Darity Jr. explains that “the social dominance of the captains of industry has given way to the social dominance of … a professional-managerial elite” (1990, p. 247). Class divisions and economic inequalities are derived from the managerial age. In this context, Darity justifies government intervention on the basis of employment policy, including recommendations for work-sharing and early retirement.

In the last two decades of the twentieth century, competition increased, technological change began advancing at a stronger pace, and finance became more widely available. In this context, managerial capitalism was challenged by the emergence of patrimonial capitalism. Patrimonial capitalism arrived with financial globalization and the increased importance of small shareholders and pension funds, notably in the United States. Therefore, a new mode of corporate governance based on financial criteria has been imposed. The main objective is to protect external investors by limiting the obstacles that affect their control. Transparency, responsibility from top management, contestability of corporate control, and managerial compensation associated with the maximization of shareholder value are advocated. However, scandals in the early 2000s involving the management of public corporations such as Enron, Vivendi Universal, or WorldCom stress the contradictions of a growth system built on market finance. In parallel, new kinds of firms built around human capital have arisen (Rajan and Zingales 2000), and
interfirm relationships have rapidly increased (Langlois 2003). As a result, forms of capitalism—managerial and financial capitalism—experienced so far are highly questioned. The coevolution of organizational forms and the economic system (Chandler 1990) suggests a renewed capitalism that would protect the interests of all corporate stakeholders and guarantee social equality.

CAPITALISM, STATE

Depending upon the evolution of social institutions, especially the state, capitalism assumes distinctive characteristics in different nations. The state—that is, government organizations of a nation and its territorial subdivisions and localities—protects and provides a legal framework for businesses operating through markets. In state capitalism, broadly defined, the state actively fosters, subsidizes, provides services to, regulates, and sometimes controls investor-owned business.

Many varieties of state capitalism can be found throughout the world. In formerly communist nations, for example, the state determines how the enterprises it previously owned can adopt features of capitalism, such as private ownership and buying and selling on open markets. State capitalism also includes established capitalist economies where authoritarian or fascist states direct the economy. In most democratic nations, state capitalism takes the form of welfare-state capitalism. For the market-oriented capitalism of the United States, strong military and international organizations are used to enforce a hierarchical economic order around the globe.

THE STATE AND THE TRANSITION TO CAPITALISM

Some communist regimes, like that of the People's Republic of China, have opted for a gradual transition to state capitalism. Despite the expansion of markets and private ownership, much state ownership and control remains. In contrast, Russia and Eastern Europe having attempted a rapid shift from communism to extensive private ownership and markets, can be characterized as transitional-state capitalism.

In the state capitalism of the People's Republic of China after 1993, markets and capitalism coexist with continuing state and collective ownership and government plans that determine the quantity of goods produced and the prices paid to enterprises for their products. Nevertheless, Chinese firms purchase materials and hire labor through markets. One-quarter of industrial goods were produced in 1999 by state-owned enterprises, one-third by collectively owned enterprises, and two-fifths by individually and family-owned enterprises and ventures with foreign corporations. In state enterprises one-third of the shares were privately owned. Top local government and party officials control collectively owned enterprises. In contrast, foreign joint ventures are freer from government interference and corruption and are judged by economists to be more efficient producers. However, much of China's economic growth stems from local government leaders who act as “bureaucratic entrepreneurs” (Gore 1998, p. 96), promoting growth in their communities.

“State capitalism” was initially a controversial concept that was coined and applied to the Soviet Union in 1950 by socialists sharply critical of the regime of Joseph Stalin. C. L. R. James used the term state capitalism to argue that the Soviet Union, far from being a worker's paradise as
claimed by Stalinist communists, actually extracted surplus value from Soviet workers. Although there were practically no capitalist private enterprises in Stalin’s Soviet Union, the Soviet state, according to James, exploited workers through bureaucratic regimentation just as capitalists did elsewhere.

At the end of the twentieth century in Russia, capitalism was not merely a conceptual label but rather a tangible reality of privately owned, profit-driven enterprises, operating in global markets. The capitalism in Russia could be considered state capitalism because the state, while somewhat less authoritarian than before, nonetheless has exercised tremendous power to create a new capitalist society. In Russia and Eastern Europe, the government has been a transitional state, setting policies for a very rapid adoption of capitalism. Russian and Eastern European leaders, in contrast to the Chinese, have pushed for a “shock therapy” transition through neoliberal policies, opening their nations to global trade, attempting to stabilize their currency in relation to the dollar, and privatizing state-owned enterprises. Beginning in 1992, shares in Russian state-owned enterprises were purchased by employees of the enterprises (who held 40% of the shares in 1996), managers (held 18%), other Russian firms (11%), and individuals (6%). Although the government offered a voucher to each citizen to buy shares, most citizens sold or gave away their vouchers or placed them with investment funds. Enterprises whose shares had been largely sold accounted for more than 90 percent of Russian industrial output by 1998. The government then exchanged additional shares for loans from selected Russian private banks and investments from Western corporations. A small group of Russians received huge financial windfalls through their connections with government elites who directed the privatization process. Privatized enterprises were even more likely to show a loss than enterprises that remained in state hands. Privatization has not revived the ailing Russian economy, which lost one-half of its domestic production between 1989 and 1999.

In the transitional-state capitalism of the Czech Republic, compared to Russia, more shares of companies are held by the public, and fewer by workers in state enterprises. In the Czech Republic, shares amounting to one-half the value of state enterprises were privatized through vouchers distributed to citizens by 1995. Two-thirds of the vouchers were handed to investment privatization funds, run by state banks, which purchased shares of enterprises for individuals. In Poland, the state maintains an even larger role, maintaining more public enterprises and deciding which key enterprises are made available for foreign joint ownership.

**STRONG STATES AND CAPITALISM, ORIENT AND OCCIDENT**

The concept of state capitalism can also be applied to capitalist economies where an authoritarian, one-party government actively directs the economy. In South Korea, the military regime of Park Chung Hee (1917–1979) in the 1960s gave money to exporters, raised tariffs on imports, created industrial zones, controlled wages, and channeled capital to favored chaebol (coordinated industrial conglomerates), thereby producing rapid development of the steel, cement, shipbuilding, and machinery industries, followed by the chemical, auto, and electronics sectors in succeeding decades.

In the more established capitalist economy of Germany in 1933, the fascist regime that took power allowed cartels of large businesses to continue under the same ownership. Whereas the cartels preferred state policies to increase their exports, Führer Adolf Hitler developed an autarkic economy (independent from trade with rival industrial nations) to fight wars. Production increased because of new state-subsidized industries in motor vehicles, aviation, aluminum, and chemicals. After World War II, dictatorships in Spain, Portugal, and Greece supported the dominance of domestic banking and commercial establishments that played a junior role to large U.S. and European firms.

In democratic nations with advanced economies, some national governments have brought together trade unions and big business associations into “corporatist” agreements on wages, prices, government budgets, welfare-state programs, investments, and economic growth. In Japan, the government Ministry of International Trade and Industry (MITI) brought business, labor, and government officials together and, between 1950 and 1980, successfully encouraged economic growth through an industrial policy that subsidized exports, developed technologies, and promoted new industries.

In Sweden, Norway, and Denmark, strong social-democratic political parties rooted in trade unions have produced relatively generous subsidies for children, paid leave for parenting, unemployment and medical insurance, and relatively egalitarian, government-provided retirement benefits. On the continent of Europe, welfare-state programs have been geared toward male breadwinners who have stable and well-paying jobs in unionized industries. As welfare-state spending has been cut throughout Europe, Anthony Giddens has advocated trimming subsidies for consumption and boosting investments in people, such as job training, education, and health care to make more productive workers.

Government programs providing pensions and health care in the United States, compared to other economically developed nations, have been less generous and compre-
hensive and have been adopted later in history or not at all. Presidents such as Ronald Reagan and George W. Bush attempted to cut welfare spending for the poor, reduce tax rates and business regulation, and increase spending for the military and foreign affairs.

Since the fifteenth century, dominant nations have developed strong states to gain a superior position in a world system of capitalism. By the beginning of the twenty-first century, national sovereignty had been eroded amid the rapid flow of goods, investments, and knowledge that spanned the globe. In their book *Empire* (2000), Michael Hardt and Antonio Negri argued that capitalism still requires state power; not in the form of a colonizing nation but rather in the form of international elites and institutions backed by the military power of the United States.

**CAPITALIST MODE OF PRODUCTION**

The concept of the capitalist mode of production (CMP) occupies a central place in Karl Marx’s (1818–1883) view of productive relations, forms of exploitation, and conflict in modern society. The very notion of capitalism was used predominantly by Marxists well into the twentieth century, when it started to be thoroughly analyzed in a non-Marxist perspective by Max Weber (1864–1920) and Werner Sombart (1863–1941).

**THE CAPITALIST MODE OF PRODUCTION IN THE THEORY OF KARL MARX**

In his work, especially the *Grundrisse* (1857–1858) and the first volume of *Capital* (1867), Marx defined capitalism as a mode of production characterized by the separation of the direct producers, the working class, from the means of production or the productive assets, which are controlled by the bourgeoisie as private property. Ownership of the means of production enables the bourgeoisie to organize the industrial labor process, where individual workers are driven to seek employment by the needs of their own reproduction. Contrary to previous modes of production such as slavery and feudalism, the laborer is compelled to enter an employment relation not by external compulsion, but by economic necessity.

As a result, the employment relation is formally an individual contractual transaction between bourgeois capitalists and workers, who are juridically free. Once they enter the capitalist labor process, workers are remunerated with a wage, a monetary sum representing the “exchange value” with which the capitalist purchases the worker’s labor power. The wage is expressed in terms of the duration of the working day, and is calculated on the basis of the goods that workers need to reproduce their ability to work. Therefore, the wage does not recognize specific forms of labor or skills, it only compensates “abstract” labor power.

In the productive process, workers operate machines and other means of production with which they create commodities whose values exceed workers’ remunerations. When capitalists sell commodities on the market, “realizing” their value, they therefore appropriate the difference between the value of such goods and the value of the labor power used to produce them. Marx calls this dif-
ference “surplus value,” which for him is the defining feature of the exploitative nature of capitalism. The money capitalists earn from realizing their surplus value contains a profit, which capitalists reinvest to restart the productive cycle in what Marx calls “extended reproduction” of capital. Marx saw the origins of profit and surplus extraction in the very process of production, not in market dynamics of supply and demand, as in the “bourgeois” political economy of Adam Smith (1723–1790) and David Ricardo (1772–1823). Nonetheless, Smith and Ricardo influenced Marx’s concept of the division of labor and his “labor theory of value,” respectively. Marx, however, regarded the market not as a realm of free individual initiative, but as an institution that materializes human exploitation and alienation.

For Marx, the CMP is a social process riddled with contradictions that originate from its own “laws of motion.” The growing “concentration” of accumulated capital is what ultimately allows individual capitalists to increase their profits and drive competitors out of the market. The elimination of uncompetitive capitals produces a centralization of ownership in a smaller number of large companies. But successful competition also requires increasing investment in machinery (“constant capital”). As a result, the surplus value extracted from human labor is eroded and, in the long term, the rate of profit for the CMP as a whole tends to fall. In the process, masses of workers are expelled from the production process and end up swelling the unemployed “relative surplus population.”

Marx described the laws of motion in the CMP far more precisely than in other modes of production. His aim was in fact to scientifically demonstrate how the demands of the working class are ultimately incompatible with capital’s exploitative nature. As the contradictions of the CMP manifest themselves in periodic crises, workers become conscious of their own exploitation as a class. Therefore they organize to accelerate capitalism’s eventual demise and establish a socialist society where class domination is abolished.

Marx tended to present the development of the CMP as a social dynamics whose general laws of motion could be scientifically ascertained. He was nonetheless quite aware that the process he described was historically specific and located largely in Western Europe. England had for him a prototypical CMP. There, the birth of a capitalist agriculture and the rise of mechanized manufacturing in the late eighteenth and early nineteenth centuries enabled the Industrial Revolution, which benefited from world trade and technological innovation. Marx associated the rise of capitalism with the establishment of a form of state whose laws and institutions protect private property, capital accumulation, and formal liberties that enable contractual relations between workers and capitalists. This stage of political development is represented by the liberal state, whose juridical and ideological “superstructure” is functional to reproduce the “base” of capitalist relations of exploitation.

CAPITALISM AND IMPERIALISM IN EARLY MARXIST DEBATES

Marx’s awareness that the birth of capitalism was a historically and geographically specific process led him to recognize, as in his 1881 letter to Vera Zasulich, that Western Europe’s “pure” transition to capitalism is not immutable and necessary for all societies. Many debates on the CMP in twentieth-century Marxism revolved around the different ways in which the economic structure of capitalism determines social and political relations, capitalist crises, the role of the state, and the significance of class struggles and workers’ agency. Reformists in the Second International (1889–1916), especially Eduard Bernstein (1850–1932), argued that capitalism was not necessarily heading toward unsolvable crises, because governments’ interventions in the economy could actually improve the conditions of the working class. In this view, therefore, socialism could be established through workers’ participation in electoral politics, rather than revolution.

Vladimir Lenin’s theory of imperialism, influenced by Rudolf Hilferding’s Finance Capital (1910), argued that capitalism leads to a growing concentration of ownership in large monopolistic conglomerates. Antonio Gramsci (1891–1937) added to such trends the transition toward “Fordist” mass production. For Lenin (1870–1924) and Nikolai Bukharin (1888–1938), the growth of gigantic capitalist corporations, and their need for new markets, propelled Europe’s colonial expansion and imperialist control of non-Western economies. In Rosa Luxemburg’s The Accumulation of Capital (1913), colonialism and imperialism are responses to overproduction in metropolitan economies, and are coterminous with the ruthless destruction of precapitalist societies, what Marx referred to as “primitive accumulation” (1867). In contrast to reformist socialists, such views maintained that capitalism is shaped by crises and conflicts, and rejected the argument, held to some extent by Marx himself, that colonialism was a progressive force that destroyed pre-existing despotism and backwardness.

POSTWAR MARXIST PERSPECTIVES ON CAPITALISM, PRODUCTION, AND THE STATE

After World War II growing government intervention in the economy, and the rise of the welfare state, renewed interest in the relations between capitalism and the state among Marxist scholars. Important examples are the work of the “Frankfurt school” (especially Friedrich Pollock and
Herbert Marcuse) and Paul Sweezy’s *Theory of Capitalist Development* (1942). In the 1970s and 1980s Ralph Miliband, James O’Connor, and the “regulation paradigm” (Michel Aglietta, Robert Boyer) underlined the important role of the state in stabilizing capitalism by financing the reproduction of the working class. Similarly, Nicos Poulantzas referred to the “relative autonomy” of the state as the manager of capital’s “general interests.” His reevaluation of the relevance of politics was linked to the work of “structuralist” Marxists, especially Louis Althusser (1918–1990), who viewed the economy as “determining” social relations without being necessarily “dominant.”

Meanwhile, colonialism and imperialism led Marxist theorists of “dependency,” especially André Gunder Frank (1929–2005), and of the “capitalist world economy,” particularly Immanuel Wallerstein (b. 1930), to see capitalism as a global system articulated in “core” and “peripheral” societies. In both views, capitalist trade links the growth of industrialized countries to the continued underdevelopment of the world’s peripheries. Critics, however, accuse such theories of making the periphery a passive object of domination, neglecting processes of production and the complexities of social relations in the global south. Structuralist analyses of the “articulation of modes of production” (by, for example, Althusser, Etienne Balibar, and Harold Wolpe) propose a view of capitalism as an “uneven” social formation that subordinates precapitalist societies, which nonetheless retain their specificities. “Uneven capitalist development” also features prominently in David Harvey’s work, which also focuses on capitalism’s negative environmental impacts.

Starting from the 1970s the concept of CMP also has been criticized by feminist Marxists (e.g., Mariarosa Dalla Costa, Leopoldina Fortunati, Maria Mies, Heidi Hartmann) who indicted its neglect of gender contradictions. In fact, they emphasized, capitalist production is made possible—also with the complicity of a working-class image of waged work as a manly occupation—by the confinement of women to the household role of unpaid workers.

Finally, “autonomist” Marxists—largely influenced by Italian “workerists” of the 1950s and 1960s (Raniero Panzieri, Mario Tronti, Antonio Negri) and by the work of Michel Foucault, Gilles Deleuze, and Felix Guattari—criticized traditional Marxist views of social relations as mechanically determined by economic dynamics. Instead, they considered class struggles and workers’ subjectivity to be the main causes of capitalist crisis. In this view, as in Antonio Negri’s and Michael Hardt’s *Empire* (2000), capitalist responses to national class struggles ultimately opted for the economic liberalization policies that underpin the globalization of production and finance. Autonomists, in fact, see globalization as part of capital’s broader strategy to establish its control beyond the workplace to the totality of the “social factory,” human interactions, and everyday life.

**CARIBBEAN, THE**

The Caribbean lies at the heart of the Western hemisphere and was pivotal in Europe’s rise to world predominance. Yet the islands that once marked the horizon of the West’s self-perception, as well as the source of its wealth, have been spatially and temporally eviscerated from the imaginary geography of Western modernity. The physical incorporation and symbolic exclusion of the Caribbean from...
the imagined time-space of “modernity” has made certain ideas of “the West” viable, and they must therefore inform any effort to describe the Caribbean within the social sciences. Since their inception, the social sciences have used non-Western places as counterfoils for Western modernity—they have been viewed as “backward” or “traditional” places against which processes of modern progress, urbanization, industrialization, democratization, rationalization, individualization and so on could be gauged. Yet the Caribbean has never fit easily into such dichotomous visions of the world, for it was always a product of modernity and was in many ways postmodern avant la lettre (before it existed). The anthropologist Sidney Mintz has argued that the Caribbean was “the first part of the non-Western world to endure an era of intensive Westernizing activity.” Thus, “the Caribbean oikumene became ‘modern’ in some ways even before Europe itself; while the history of the region has lent to it a coherence not so much cultural as sociological” (Mintz 1996, p. 289).

Mintz supports a processual definition of the Caribbean as an oikumene (ecumene, or “inhabited land”), a historic unit that is “an interwoven set of happenings and products” (Mintz 1996, p. 293). Franklin Knight likewise argues that “the sum of the common experiences and understandings of the Caribbean outweigh the territorial differences or peculiarities” (Knight 1990, p. xiv). The geographical region includes the islands of the Greater Antilles, the Lesser Antilles, and the Bahamas, as well as the coastal areas of Central and South America that have been politically and culturally linked to the Caribbean by processes of colonization, plantation development, and migration. It is also sometimes extended to include far-flung diasporas, especially in Europe and North America. While there are quite distinct traditions of study linked to areas such as the British West Indies, the French West Indies, or the Spanish Antilles, there has also been an increasing amount of comparative and cross-regional research. And while there are differences in the study of dependencies or colonies versus independent states, the Caribbean as a whole can be understood as being marked by complex and uneven processes of imperial decline, postcolonial nation-building, and regional integration.

Above all, the Caribbean was constituted by the global mobilities of colonization, slavery, and the transatlantic plantation system. With the rise of the sugar “plantation complex” the region was marked by the displacement of indigenous peoples by those arriving from northern and southern Europe, eastern and western Africa, and, later, the Indian subcontinent, China, and the Levant. Being more deeply and continuously affected by migration than any other world region, the essence of Caribbean life has always been movement. The very idea of this dispersed and fragmented region as a single place—and its naming and contemporary material existence—are constituted by mobilities of many different kinds, including flows of people, commodities, texts, images, capital, and knowledge. Thus, the Caribbean exists at the crossroads of multifaceted networks of mobility formed by the travels of both people and things, as well as by those people and things that do not move. Alongside the work of capitalist expansion and contraction associated with commodities such as tobacco, sugar, coffee, rum, salt, cotton, indigo, and, later, bananas and tropical fruit, the Caribbean has also been indelibly shaped by the work of imagination and culture-building over the past five hundred years.

Creolization is one of the crucial elements of Caribbean culture building, conceived as a process of indigenization, hybridization, and contested “creation and construction of culture out of fragmented, violent and disjunct pasts” (Mintz 1996, p. 302). Later, the arrival of Caribbean migrants in the metropoles such as London, New York, Toronto, and Miami allowed for the emergence of new kinds of pan-Caribbean identifications, arts movements, musical amalgams, and cultural events like Carnival. This region, more than any other, has long been at the forefront of transnational processes through its uprooted people, Creole cultures, and diasporas traveling across the world. It thus became central to the theorization of transnationality, diaspora, and postmodernity in the 1980s, and to the subsequent emergence of Black Atlantic studies and world history in the 1990s. Social scientists studying globalization turned to Caribbean theoretical concepts such as transculturation, creolization, and marronage to describe contemporary global cultural processes, even while they ignored some of the historical specificity and nuances of these concepts within Caribbean studies.

At the beginning of the twenty-first century, the region is enmeshed in complex mobilities, including circuitous migrations of people and diverse cultures; transnational flows of capital investment and financial services; technologically mediated flows of information, communication, and intellectual property; and unpredictable global risks and threats to security (e.g., drugs, diseases, criminals, hurricanes). These new mobilities and immobilities, both intra- and extra-Caribbean, are transforming the nature, scale, and temporalities of families, local communities, public spaces, governance structures, and individuals’ commitments to a specific nation. Caribbean mobilities and moorings are paradigmatic of the complex rescaling of urban, national, and regional space. Daily practices of commuting, accessing goods for consumption, moving through public spaces, and communicating with the diaspora help to perform the presences and absences, the proximities and distances, that inform the
lived experience of spatiality in the Caribbean and its transnational diasporas.

Global risks associated with criminal activities, terrorism, environmental disasters, and other security issues are also producing new modes of surveillance and the governance of local mobilities within and outside of the region, with significant impact on forms of belonging and exclusion, of connection and disconnection. Thus, Caribbean societies—and the idea of the region as a whole—are being rescaled and respatialized by changes in the infrastructure of transportational and informational mobility, and cultural practices of travel and migration. Understanding exactly how the contemporary Caribbean is being both “demobilized” and “remobilized,” and both deregulated and re-regulated, within the processes of urban, state, regional, and global restructuring can enable social scientists to move beyond the imagery of states as spatially fixed geographical containers for social processes, and to question scalar logics such as local-global. Thus, a rethinking of the processes that are remaking the Caribbean in the twenty-first century will be crucial to advancing the social sciences’ approach to area studies and global studies in ways that finally move beyond its Eurocentric origins and assumed forms of territoriality.

CARRYING COST

Carrying costs have played both a practical and a theoretical role in economics. From the practical standpoint, carrying costs are known as the costs of interest, warehousing, wastage, and possible decline in marketability, which holding for future use implies for marketable commodities. Thus those goods for which there has historically arisen a formal method of grading and of trading over time—forward or futures markets—are subject to such carrying costs and the existence of them is a well known fact for financial traders and commentators.

Theoretically, carrying costs entered the literature with Henry Crosby Emery’s influential *Speculation on the Stock and Produce Exchanges of the United States* (1896). Emery noted that the level of carrying costs forms one determinant of future prices, along with expectations of price change, themselves dependent on expectations of future supplies and demand. In this way Emery put forward a doctrine of the social usefulness of commodity exchanges to end users, such as farmers and manufacturers, by virtue of the possible unburdening from these economic actors to traders of the risk of price fluctuations by the buying or selling futures contracts. Further, this explanation acquitted the commodity exchanges of the charge (frequently leveled in the nineteenth century) that they fostered antisocial speculation. Emery’s view was given wide exposure in the works of Irving Fisher and Alfred Marshall, among many others.

The further development of the carrying cost concept was mostly due to the work of the English economist John Maynard Keynes. Keynes first suggested in his *A Tract on Monetary Reform* (1923) that a theory of the (then new) organized forward markets in different international currencies could be based on the short-term interest rates available to holders of currency in different money markets. This notion was to become carrying cost more generally in his later work, and his discussion centered on its role in the currency trade (in which he himself was actively engaged).

Keynes laid out a theory according to which such trading would be driven to a configuration of spot and future prices such as to ensure the traders could both pay the inevitable carrying cost of taking a long position and also make a (typically small) competitive profit. The premium or discount at which the future price stands in relation to the spot price is thus a barometer of expectations
about the course of the price in the future. In normal
times, under the expectation of steady or growing output
the future price will be above the spot, and the traders can
earn their “turn” and still pay their carrying costs (in cur-
rency in interest) out of this difference. In the parlance
of his A Treatise on Money (1930), this is known as a “back-
wardation.” In abnormal times, though, when there is a
sudden onset of a “bear” position on any currency (as in
the expectation of a recession or of political upheaval), it
might be that the spot price prices are forced to fall below
both the quoted and expected future price in order to
induce traders to hold stocks of the good in question for
the period of the contract. Such a “contango” on futures
markets was evidence of the need to continue to pay
mounting carrying costs (in the special case of easily
stored and infinitely lived money, purely an interest
charge) into an uncertain period of decline expected in its
value.

In A Treatise on Money this theory of carrying costs
and the economic role of futures trading was expanded to
commodity markets (which Keynes also actively specu-
lated in) and the term and concept was explicitly intro-
duced. There it also played a part in a more systemic view
of economic cycles. The main point made (in argument
with Ralph G. Hawtrey) is that one should not look to
futures trading to alleviate the severity and duration of
downturns, because carrying costs severely limit the
degree to which such markets may profitably carry over
redundant stocks of liquid capital goods during the down-
turn. In consequence those stocks cannot be expected to
be available to provide the working capital, and so ease the
transition to, the next upturn (as Hawtrey had argued). In
pursuing this line of reasoning, Keynes also suggested that
the concept was of wider import, as even “less organized
markets” (p. 128) were subject to carrying costs, but not
in so formal and obvious a manner. This is the hint that
was to be expanded into of full-blown theory of unem-
ployment in his next book.

In The General Theory of Money, Interest and Em-
ployment (1936) Keynes suggested, particularly in
chapter 17, that this theory of the forward market could
be generalized to the whole economy, and, significantly,
that it contained the clue to the answer of why economies
might get “stuck” in unemployment equilibria (such as
was then happening in Europe and North America). His
generalization started from the notion that all outputs
have carrying costs (often so high as to make their carry-
ing over of them in inventory all but impossible). These
costs formed a third element alongside the essential liq-
uidity and productivity that all goods might possess in
some degree. But some goods, considered as an asset, had
the peculiar and socially defined quality of having the
highest liquidity in excess of their carrying costs among all
outlets for storing saved income. Such “money” goods
would be sought, for their superior ability to maintain
their value through time. This quality, Keynes argued, was
of particular importance in periods of economic down-
turns, since it provided harbors of safety for owners of
wealth, who might therefore be reluctant to engage in
alternative investments such as purchasing and using
employment-generating “productive” assets. The lack of
any social mechanism to discourage this individually
rational, but perhaps socially dysfunctional, “flight to
money,” could explain the phenomena of high and per-
sistent unemployment such as characterized the advanced
capitalistic economies of the world in the 1930s and still
often threatens them in the early twenty-first century.

CARTER, JIMMY
1924–

James Earl Carter, a U.S. naval officer, farmer, Georgia
state senator and governor, and the thirty-ninth president
of the United States, was the most inexperienced politi-
cian to serve as president in the latter half of the twentieth
century. This inexperience contributed to President
Carter’s mixed legacy in foreign and domestic policies,
despite having the largest majority of Democrats in the
U.S. Congress since the Lyndon Baines Johnson
(1908–1973) administration, as well as initial support
from the American people to chart a new course in presi-
dential politics.

Elected the first southern president since before the
Civil War (1861–1865), Carter campaigned against cor-
rupption and dishonesty in Washington, maintaining that
he would never lie to the American people. His honest
character and an anti-Washington environment, includ-
ing lingering public resentment over Gerald Ford’s pardon of Richard Nixon (1913–1994), undoubtedly helped Carter build an early and commanding thirty-point lead in polls. But Carter needed the help of Ford’s own gaffe in the second presidential debate, during which Ford stated that the Soviet Union did not dominate Eastern Europe, to narrowly defeat the incumbent and former vice president by only fifty-seven electoral votes. Carter would later understand the impact that the media could have on his presidency when they focused more on his cardigan sweaters (style) than his policy message about the oil shortage (substance) during his short-lived fireside chats.

In foreign policy, President Carter achieved significant victories and stunning defeats. Just as Nixon was the first U.S. president to visit China, Carter was the first to normalize relations with the Communist country. Carter also helped broker the Camp David Accords, which brought peace between Egypt and Israel in March 1979. He had earlier won a hard-fought victory in the Senate (however unpopular) when it ratified the Panama Canal Treaty in April 1978, turning control of the canal over to the Panamanian government partially in October 1979 and completely on December 31, 1999.

Despite receiving a bump in his job-approval ratings (from 31 to 52%, according to the Gallup Poll) following the seizure of hostages in Iran, Carter was criticized for his decision to admit the ailing shah of Iran into the United States for medical treatment. This action precipitated the taking of more than sixty American hostages from the U.S. embassy in Tehran on November 4, 1979. This crisis plagued the Carter presidency until his successor, Ronald Reagan (1911–2004), took the oath of office on January 20, 1981, when all the hostages were released. Previous diplomatic, economic, and military efforts to secure the release of the hostages had failed. Most politically damaging to the president and his reputation as chief diplomat and commander in chief was a failed rescue mission on April 24, 1980, in which three malfunctioning helicopters forced the operation to be aborted. Carter’s inability to secure the hostages’ release defined his presidency as a failure in foreign policy, despite its numerous diplomatic successes.

The relationship of the United States with the Soviet Union also proved mixed during the Carter presidency. Carter signed the SALT II arms control treaty with Soviet premier Leonid Brezhnev (1906–1982) in June 1979, but the U.S. Senate did not ratify it. The Soviet invasion of Afghanistan in December 1979 all but ended the administration’s hope for ratification. The invasion also precipitated a U.S. grain embargo of the Soviet Union (ended by Reagan in 1981), a United Nations resolution calling for the withdrawal of Soviet troops from Afghanistan, and a boycott of the 1980 Summer Olympics in Moscow by the United States and sixty-three other nations. It also led to the “Carter Doctrine,” outlined in Carter’s last State of the Union address in January 1980, which established that any attempt by the USSR “to gain control of the Persian Gulf region will be regarded as an assault on the vital interests of the United States.”

Carter is often blamed for failing to deliver what all presidents must deliver to be politically successful and ensure their own reelection: a strong economy. His difficulties in convincing Congress and the American public to adopt his massive energy program are tantamount to the policy problems he faced. The final energy statute was much weaker than what he had requested, and the American people did not receive well his pleas for sacrifice and conservation, despite the intended benefits. Carter is often viewed as an unskilled legislative leader, in part because he proposed too many major legislative initiatives (Light 1999). Yet, his domestic victories have had a lasting impact on American society. Two major successes—founding the departments of Energy and Education—withstood calls for abolishment by the Reagan administration and remain influential and indicative of the legacy of the Carter presidency. Other successes, such as deregulation of the airlines (1978), natural gas prices (1978), and the trucking industry (1980) continue to affect American consumers, just as the Alaska Land Act (1980) set aside over 100 million acres of federal land for wilderness areas and national parks.

The failures of the Carter presidency clearly overshadowed his important policy successes. His opponent in the 1980 presidential election, the former Republican governor of California, Ronald Reagan, simplified voters’ decisions to a retrospective evaluation of the current administration—are you better off now than you were four years ago? Carter lost by 10 percent in the popular vote, but won only six states and the District of Columbia—forty-nine electoral votes or 9 percent of the total—in his failed reelection bid on November 4, 1980.

As a former president, Carter has been involved in numerous humanitarian and diplomatic missions. Well known as a volunteer for Habitat for Humanity, Carter also led a diplomatic convoy to avert a crisis in Haiti (1994), lectured in political science at Emory University, and won the Nobel Peace Prize in 2002 “for his decades of untiring effort to find peaceful solutions to international conflicts, to advance democracy and human rights, and to promote economic and social development” (Nobel Committee 2002). Just as when he was president, Carter continued to foster human rights around the world. In these and other ways, Carter has been uniquely more respected and influential after 1980 than he was during his term as president.

CARTOONS, POLITICAL

Throughout world history, political cartoons have illustrated the age-old adage that a picture is worth a thousand words. Since the sixteenth century, illustrated caricatures have been used as satire, drawing attention to important political and social events of the day. But in 1843, the practice gained a new name when England's *Punch* magazine published a drawing parodying preliminary sketches of paintings commissioned for the houses of Parliament. “Cartoon No. 1,” as the illustration was called, was the first use of the word *cartoon* to describe humorous, satirical, or witty drawings or caricatures. It used simple imagery to communicate a message aimed at influencing public debate and the political process.

A surprising forefather of the political cartoon is Martin Luther, the sixteenth-century religious reformer, who used illustrated booklets and posters in a campaign to reform the Catholic Church. In *Passional Christi und Antichristi* (1521), illustrated by the printmaker Lucas Cranach, Luther contrasted easily recognizable scenes from the Bible with scathing caricatures of the Catholic Church. One set of illustrations juxtaposed Christ driving the moneylenders out of the Temple with the Pope selling indulgences. The practice of using satirical drawings to make political commentary caught on in Europe, and the practice eventually spread around the world.

Political cartoons were very influential in early American political culture. In 1754, Benjamin Franklin became the first to publish a cartoon in an American newspaper. Franklin, a supporter of unifying the colonies for protective purposes, used a common superstition to get his message across. It was believed that a snake that had been severed would come to life again if its pieces were put back together before nightfall. Franklin drew a picture of a snake cut into eight pieces, with the caption “Join, or Die.” Using easily recognizable symbols as shorthand for commentary remains a staple of modern political cartoons.

Even in the eighteenth century, political cartoons traveled around the world, crossing language and cultural barriers. One famous example is that of William “Boss” Tweed, the head of the political machine that had run New York City since 1789. Tweed was caricatured as a crook in a series of political cartoons by Thomas Nast in the American publication *Harper’s Weekly*. “Stop them Damn Pictures,” demanded Tweed, “I don’t care so much what the papers write about me. My constituents can’t read. But damn it, they can see pictures.” When Tweed fled an American jail for Spain, a Spanish official recognized him from his cartoon likeness, leading to his arrest and return to America.

In the twenty-first century, cartoons are often used as a vehicle for disseminating political commentary around the world. Political cartoons now come in many forms, from the one-frame cartoons found on the editorial pages of newspapers to multipaneled cartoons commonly referred to as comic strips. Political content can also be found in other popular cartoon forms, such as comic books, graphic novels, and Japanese anime, and in different media venues, such as television, movie theaters, and the Internet. Recurring politically charged comic strips, or “funnies,” are particularly well suited to using humor to deal with significant issues. Comic strips are able to address social and political issues by weaving them into the day-to-day lives of their characters. In America, the syndicated comic strips *Doomsday* and *The Boondocks* are examples of daily comic strips that provide biting social commentary and critiques of the government.

CASE METHOD

The case method (or the case study) is a prolonged, intimate, and detailed investigation of a single case or a set of cases. The in-depth analysis of a case or small set of cases illuminates larger sociological processes and phenomena. The case method is used in urban and rural ethnographies, life histories, and social histories of a group of people or an event. Cases can be empirical, theoretical, or “discovered” during the research process. The case method requires an ongoing, engaged, and critical conversation between data collection and data analysis. Typically, the social scientist using the case method refines her definition of a case throughout the course of a study (Becker 1992). The case method is especially useful in illuminating social worlds that are not appreciated or understood by others.

The history of the ethnographic case study is grounded in a volume of works produced by the Chicago school during the early twentieth century. Early Chicago school scholars used the case method to illuminate people’s understanding of urban culture (Zorbaugh 1929 1976), race and ethnic relations, and social problems such as homelessness (Anderson and Council of Social Agencies of Chicago 1923), poverty and segregation (Wirth 1928), deviance, and delinquency (Thrasher 1927). The naturalistic case study grounds observations and concepts in everyday social interactions and processes, which are observed directly by the researcher. Social scientists using the extended case method seek to complicate or “extend” extant concepts and theory by explicitly linking the case under study to local, national, and global trends and histories (Burawoy 1998).

Today, the case method is valued for its utility in labeling previously undocumented or misunderstood activities and understanding complicated social or historical phenomena, including social problems such as poverty, homelessness, drug use, and inner-city violence. Like early Chicago school scholars, contemporary social scientists use participant observation and in-depth interviews to systematically examine a social group or social phenomenon, while also developing new and innovative ways to collect data (Emerson 2004). In addition to data collected from direct and participant observation, the case method also takes advantage of the available quantitative data, including public records, and, at times, archival data. The primary data source for ethnographic case studies is the field researcher’s notebook. Throughout the research process, the social scientist takes copious field notes, which are essential to data analysis and to the final presentation of the study to outside audiences (Emerson 2004). A common analytical tool used in case studies is analytical induction; a working hypothesis is developed once the researcher begins to collect data on his first case and then tests and refines his developing theory throughout the process of data collection and analysis (Becker 1998). Typically, the findings from a case study are presented in narrative form, as a story that conveys the lived experience of the social group, actor, organization, or historical event.

Large quantitative studies (such as a population census or a large-scale survey) emphasize researcher objectivity. In contrast, the case method uses a researcher’s subjectivity (Ragin 1997) or reflexivity (Burawoy 1998) as a tool to deepen one’s understanding of a social group or phenomenon. Field researchers who are concerned with limiting the influence of researcher bias may construct a team of field researchers that will effectively standardize the process of data collection and analysis (for example, Newman 1999). A noted strength of the case method approach is the validity of its findings. Typically, the researcher using the case method has a wealth of sources including field notes, interviews, media reports, and archived materials to “triangulate” or cross-check during the research process. Critics also argue that the case study method does not allow for the generalization of findings to a much larger population of cases. Some researchers identify this as a limitation of the case method in the presentation of their findings, while others argue that one can generalize from a single case study to others, if similar conditions exist (Becker 1967).

Social scientists who use the case method help to complicate our understanding of everyday life, social processes, and social phenomena in ways that are elusive or impossible for quantitative-based studies to accomplish. At times, the most rigorous case studies will form the foundation of larger quantitative studies. The deep insight generated from the case study illuminates the many problems that concern contemporary social scientists.

CASE METHOD, EXTENDED

The extended case method was initially developed by anthropologists Max Gluckman (1911–1975) and Jaap van Velsen (1921–1990) in the late 1950s and early 1960s. It was designed to confront the decontextualized abstractions of structural approaches with richly detailed accounts of the actions and choices of real individuals. As conceived by Gluckman, the method places less emphasis on identifying structural regularities and more on detailed analyses of social processes wherein individual strategies and choices reveal the context of everyday life. He placed particular emphasis on extending case studies temporally, as “the most fruitful use of cases consists in taking a series of specific incidents affecting the same persons or groups, through a long period of time, and showing … [the] change of social relations among these persons and groups, within the framework of their social system and culture” (1961, p. 10).

Gluckman distinguished extended cases from two more restricted uses of the case study, both of which tended to serve structuralism’s concern with social morphology: *apt illustration* (describing a simple event or action in such a way that it serves as a persuasive illustration of some general normative principle), and the analysis of *social situations* (whereby more complex microsocial events are analyzed to reveal structural characteristics at the macro level). By contrast, the extended case method includes “analyzing the interrelation of structural (‘universal’) regularities, on the one hand, and the actual (‘unique’) behavior of individuals, on the other” (van Velsen 1967, p. 148).

Van Velsen, who preferred the term *situational analysis*, also noted that: “[Structural] analysis does not allow for the fact that individuals are often faced by a choice between alternative norms” (1967, p. 131). Moreover, for van Velsen, what ultimately recommends the method is its ability to illuminate the complex relationship between a social world of “norms in conflict” (1967, p. 146) and the strategies and choices of individuals. Van Velsen also suggests that extending case studies over a broad geographical area may help researchers clarify the problem of defining the appropriate unit of study (1967, pp. 145–146).

One of van Velsen’s students, sociologist Michael Burawoy, further defined the extended case method by highlighting its reflexivity (i.e., applying its method to the investigation itself) and by advocating it as a means to reexamine the relationship between data and theory. Burawoy closely associates the extended case method with what he calls a *reflexive model of science* (1998). Like Gluckman and van Velsen, he emphasizes the importance of variations in the case through time and space, as these often help to delineate the forces shaping a particular society (1991).

Burawoy also proposes that field researchers use their observations of specific cases to challenge and reconstruct existing theory. On this line of thinking, cases are selected specifically for their theoretical relevance, and by using a case to challenge existing theory, generalization from a single case study becomes possible (1991). This is accomplished through identification and analysis of anomalous cases (i.e., cases not accounted for by the existing theory). According to Burawoy, careful attention to such anomalies “leads directly to an analysis of domination and resistance” (1991, p. 279), thereby qualifying the extended case method as “the most appropriate way of using participant observation to (re)construct theories of advanced capitalism” (1991, p. 271).

**Casino Capitalism**

SEE Case Method.

---

**CASINO CAPITALISM**

In common parlance, the term *casino capitalism* refers to the unregulated excesses associated with the "boom and bust" cycles of large speculative ventures, such as Enron. Its origins in the literature probably lie with John Maynard Keynes (1883–1946) and his famous *General Theory of Employment, Interest, and Money*, first published in 1936. In this vigorous attack on the classical and neoclassical economics that was predominant at Cambridge in the 1930s, Keynes refers to the "casino capitalism" embodied in the winning and losing of fortunes on the stock market. Keynes had already spoken in the 1920s of the immoral and insidious influence of an economy freed from restraint, believing that unfettered greed would create a wave of social problems. In chapter 12 of the *General Theory*, Keynes refers to casinos twice, first when he comments:

> Speculators may do no harm as bubbles on a steady stream of enterprise. But the position is serious when enterprise becomes the bubble on a whirlpool of speculation. When the capital development of a country becomes a by-product of the activities of a casino, the job is likely to be ill-done. The measure of success attained by Wall Street, regarded as an institution of which the proper social purpose is to direct new investment into the most profitable channels in terms of future yield, cannot be claimed as one of the outstanding triumphs of *laissez-faire* capitalism. (Keynes 1936, p. 159)

Later in the same chapter, Keynes comments:

> It is usually agreed that casinos should, in the public interest, be inaccessible and expensive. And perhaps the same is true of Stock Exchanges. That the sins of the London Stock Exchange are less than those of Wall Street may be due, not so much to differences in national character, as to the fact that to the average Englishman Throgmorton Street is, compared with Wall Street to the average American, inaccessible and very expensive. (Keynes 1936, p. 159)

In her 1986 book *Casino Capitalism*, British economist Susan Strange (1923–1998) comments: “The Western financial system is rapidly coming to resemble nothing as much as a vast casino.” Strange argues that, between about 1965 and 1985, considerable increases in risk and uncertainty in economic markets gave rise to substantial social and political disruptions in the global system. She links these changes to five major trends: (1) innovations in the way financial markets operate; (2) the increased scope of markets; (3) the shift from commercial to investment banking; (4) the rise of the Asian investment markets; and (5) the removal of government regulation from banking. Strange argues for increased regulation and more substantial American leadership, which she believes is required because of the predominant role of the United States in the world markets. Coming as it did during the period of Reaganomics, her advice fell on deaf ears.

The term *casino capitalism* also appears in the work of Irving Fisher (1867–1947) and Hyman Minsky (1919–1996). Fisher, along with others in the 1930s, was faced with the problem of explaining the tragedy of the Great Depression. The common view among economists of this era, of whom Keynes may be representative, was that financial markets were like casinos, rather than “markets” in the usual sense of the word, and that these speculations contributed mightily to the social ills of the day. Fisher, along with John Burr Williams (1900–1989) and Benjamin Graham (1894–1976), claimed that the casino metaphor was misplaced. Instead, they argued that the asset prices of financial assets reflected “intrinsic value,” which in turn could be calculated by deciding the total value of dividends likely to be produced in the future.

As with the work of Strange, who found value in the ideas associated with the term *casino capitalism*, Minsky contributed to an analysis of uncertainty in markets. Minsky is famous for proposing the *financial instability hypothesis*, which argues that most forms of capitalism tend toward instability. He supported long-term large-scale economies with decided government intervention. Dimitri Papadimitriou and L. Randall Wray (1998) argue that Minsky’s work, in this way, is best labeled *post-
Castaneda, Carlos

Keynesian because he attempted to set out the precise institutional means by which the casino system might be better regulated, whereas Keynes made only the most general of comments. In all these cases, the notion that capitalism is essentially speculative and little more than a system of big and small bets in a grand game of chance is at work, and most of the writings around this topic focus on ways to make this irrational system more susceptible to reason and stability.

CASTANEDA, CARLOS

1925–1998

Born in Cajamarca, Peru, in 1925, Carlos Castaneda moved to Los Angeles in 1955. He completed creative writing classes before enrolling at the University of California, Los Angeles (UCLA), in 1959. Castaneda's third book was approved as his UCLA doctoral dissertation in anthropology in 1973, after he changed its title and added a dissertation abstract (Fikes 1993, pp. 46, 101). His ten books (now twelve) had sold some eight million copies in seventeen languages when he died in 1998.

From 1968 to 1976, Castaneda was America's most celebrated anthropologist. His fame was subsequently eclipsed as scholarly critiques exposed fraudulent elements in his ethnography. Debunking, however, has done little to diminish Castaneda's standing as a New Age icon. Within that distinctly antirational audience, he inspired shamanic tourism and a religious cult.

Most anthropologists assumed that Castaneda's first three or four books were ethnographically factual. The most compelling evidence of fraud in Castaneda's books is textual inconsistency, especially two mutually incompatible assertions made by him, or his fictional (composite) mentor, don Juan Matus, whom Castaneda called a "Yaqui Indian sorcerer." The ingestion of three species of sacred plants was, Castaneda claimed, integral to his apprenticeship with don Juan, who "related the use of Datura stramonium (jimsonweed) and Psilocybe mexicana (sacred mushrooms) to the acquisition of power he called an 'ally.' He related the use of Lophophora williamsii (peyote) to acquisition of wisdom, or knowledge of the right way to live" (Castaneda 1969, p. 9). In Castaneda's third book, don Juan revoked the value originally ascribed to acquiring allies, via jimsonweed and mushrooms, and learning righteousness with peyote, proclaiming instead that administration of those plants was merely a strategy to shatter Castaneda's "dogmatic certainty" about his worldview. By removing that obstacle, don Juan could implant his perspective on sorcery (Castaneda 1974, pp. xii–xiii; Fikes 1996, p. 140). Don Juan's new emphasis on his teaching of sorcery annuls the tutelary function he originally attributed to the spirits contained in peyote and the other plant allies.

Self-contradictory statements resulted when Castaneda addressed skeptics without reconciling those responses with his original statements. In 1968, shortly after Castaneda's first book appeared, R. Gordon Wasson (1898–1986), a renowned specialist on sacred mushrooms, wrote to Castaneda. Replying to Wasson, Castaneda, without justification, removed jimsonweed (Datura) from the category of plants possessing allies, as originally defined by don Juan (Castaneda 1969, p. 9). Castaneda's letter to Wasson asserted that, "unlike peyote and Jimson weed, the mushrooms contained don Juan's ally." Richard de Mille recognized another textual inconsistency in Castaneda's letter. Don Juan allegedly imposed a rule of "total secrecy" about revealing how he collected those mushrooms (de Mille 1980, p. 323). Castaneda violated that rule by divulging details: "Don Juan always picked the mushrooms with his left hand, transferred them to his right, and then put them through the neck of the gourd" (1980, p. 324). Another textual inconsistency documented by de Mille (1980, pp. 322–329) concerns Castaneda's "field notes," which put him in Sonora, Mexico, on September 6, 1968, the same day he dated his letter from Los Angeles to Wasson.

Disparities between Castaneda's claims and the reports of independent researchers also attest to fabrication. Castaneda's method of achieving ecstasy by smoking a mixture of plants—including psilocybin mushrooms—has never been corroborated by any other ethnographer. Actual verification is impossible because most of the plants in that mixture were never identified. His claim of becoming a crow after smoking those mushrooms, and
being hypnotized by don Juan, is singular (Fikes 1996, p. 141).

Castaneda’s textual inconsistencies and the numerous discrepancies between his books and at least one thousand reports of independent researchers render his portrait of peyotism an inane parody. Similarly, Weston La Barre (1911–1996), a specialist in peyote rituals performed in the Native American Church (NAC), condemned Castaneda’s first two books as pseudo-ethnography (La Barre 1989, p. 272). Paradigmatic here is don Juan’s momentous decision to accept Castaneda as his apprentice, because “Mescalito” (an erroneous name for the peyote spirit) had, in the form of a dog, caroused with Castaneda (1969, pp. 33–41). That assertion is aberrant (Fikes 1993, pp. 61–62) and was contradicted when don Juan usurped the tutelary function originally ascribed to peyote.

Castaneda failed to distinguish the most elementary aspects of peyote meetings, including the purpose of such meetings and the leader’s identity (Fikes 1996, pp. 138–139; Fikes 2004). Don Juan declared that a light hovering above Castaneda in a peyote ritual was an omen. Castaneda never saw that light, and don Juan never clarified its meaning (Fikes 1996, p. 139). This unexplained “omen” contrasts with momentous experiences comprehended by recipients and validated by others, as illustrated by the light that led NAC leader Albert Hensley to read the biblical passage describing Jesus’ baptism. Hensley’s revelation set a precedent for baptism in the NAC (Fikes 1996, p. 139).

Castaneda’s followers have sought shamans comparable to don Juan among the Yaqui (who do not venerate peyote) and Huichol (whose peyote pilgrimages are legendary). Recognizing peyote as the cornerstone of Castaneda’s alleged apprenticeship, American tour operators have guided sightseers into the sacred land where Huichols venerate the peyote spirit. A steadily rising tide of tourists has stimulated Mexican authorities to incarcerate Huichol peyote hunters and has incited traditional Huichols to prohibit outsiders from entering their homeland without permits (Fikes 1999; Fikes and Weigand 2004). Castaneda’s legacy survives in the Tensegrity cult based on his teachings.

BIBLIOGRAPHY

CASTE

Nearly all societies have had some form of social stratification, whether ascriptive or achieved, based on race, class, religion, ethnicity, language, education, or occupation. The Hindu ascriptive caste system in India is perhaps the most complex and rigid. It is based on birth, which determines one’s occupation (especially in contemporary rural India), and is maintained by endogamy, commensality, rituals, dietary practices, and norms of purity and pollution. The English term caste is derived from the Portuguese word casta, which refers to lineage, breed, or race.

THE HINDU CASTE SYSTEM

The Hindu caste system is interpreted in two ways. First is the standard varna description of the caste system as a fourfold division of Hindu society. Its origins are noted in the Rig Veda, one of the sacred texts of Hinduism, which dates back some 3,000 years. The term varna, which literally means color, does not reference the actual racial features of those who fall into the four varnas, as many scholars have established. Brahmins constitute the sacerdotal order, which has priestly duties including the interpretation of numerous complex religious texts in Sanskrit, a language that traditionally only they mastered. Below them are the Kshatriyas, the caste of warriors and rulers. They are followed by the Vaisyas, who typically engage in trade and commerce. The bottom is the Shudras, or peasant and laborer caste, a large and diverse group that comprises artisans ranging from goldsmiths to washermen and peasants who may own sizeable tracts of land. Outside the fourfold system are the “untouchables,” now commonly referred to as Dalits (“the oppressed”), who perform the
most menial tasks. Normally, women in the top three varnas do not pursue the hereditary occupations, whereas Shudra and Dalit caste women do. The vast majority of India, which is rural, is caste-based as far as inheritance of occupations is concerned.

The hierarchy among various castes is further based on the notions of ritual purity and pollution. The higher the caste, the greater the purity of the group, while lower caste status is associated with pollution. Moreover, the nature of the occupation that one is born into also confers purity or pollution. For example those who dig graves, clean latrines, sweep streets, or work with leather are more polluting than those in “clean” occupations such as trade or priesthood. Those usually engaged in polluting occupations must maintain a prescribed distance from the castes deemed pure to avoid polluting them through contact. For this reason, it is not uncommon for lower caste groups to live in segregated colonies on the outskirts of Indian villages even today.

M. N. Srinivas (1962) and André Béteille (1996), among others, consider the varna description simplistic because it does not represent the empirical reality of caste in either ancient or modern India. Their interpretation of the caste system as a constellation of more than 3,500 jatis with internal and regional variations has gained validity among scholars. Whenever ordinary Indians refer to caste, they are referring to jati, not to varna. In the words of Béteille, “whereas varna refers primarily to order and classification, the primary reference of jati is to birth and the social identity ascribed by birth” (p. 22). In most sociological analyses (and here) the term caste is used to represent its jati dimension.

CASTE IN MODERN INDIA

Although the caste system has eroded to some extent, it still has a hold in contemporary Indian society. One factor in this has been the Indian constitution, which empowers the state to make special provisions for the advancement of low-caste citizens, including the more than 160 million Dalits (who are listed in a schedule attached to the constitution and thus called “Scheduled Castes”), the nearly 50 million tribals (also listed in a schedule and hence called the “Scheduled Tribes”), and the 500 million “Other Backward Classes.” Under these provisions 15 percent of government jobs and university places have been reserved for members of the Scheduled Castes, 7 percent for Scheduled Tribes, and 27 percent for the Other Backward Classes. Initially, this affirmative action was to remain in place only until these marginalized castes caught up with the more privileged upper castes, but this has not yet happened, and there are strong pressures not only to extend indefinitely these policies but also to include caste groups that traditionally belong to Shudra status. The constitution also provides for the reservation of electoral seats for Scheduled Castes in the parliament of India and all the state legislatures. Similar rules govern elections for village and district councils. Although these measures are necessary to create a level playing field for historically deprived caste groups, they also go against another constitutional objective—the elimination of discrimination based on caste.

The affirmative action measures have empowered Dalits to some extent. In 1997, a Dalit, K. R. Narayan, became the president of India, and by 2001 more than 13 percent of senior bureaucrats in the government of India were Dalits (Gupta 2001, p. 13). However, such gains are overshadowed by the stubborn continuation of inequalities. Dalits and Scheduled Tribes, particularly women, are at the bottom of the economic ladder (Deshpande 2002). Dalits in rural India are still forced into indentured farm labor. In some parts of the country there is still strong opposition to them owning land and sharing public facilities such as temples and wells.

A second factor that has enabled the caste system to flourish is its function as a “vote bank.” More often than not, elections are fought not so much over political ideologies and programs but on the caste identity of the contestants. Virtually all castes have well-organized and well-funded associations that mobilize voters for their caste’s candidates. Although such mobilization enhances political awareness and participation by various castes, at the same time it also undermines efforts to create a casteless society.

A third factor is that at the individual level, caste identity is still hereditary. Unlike Christianity and Islam, Hinduism does not approve proselytization, and it has no ecclesiastical order. Effectively, then, caste functions as the church of Hinduism, operating with centuries-old customs, norms, and values. Given these conditions, there are no recognized means by which, for example, a Dalit can move up the ritual hierarchy, or a Brahmin move down. However, following India’s independence in 1947 and adoption of a constitution that stipulated creation of a secular society, various mechanisms have evolved that have enabled members of lower castes, as a group, to claim superior social status when they emulate the customs, rituals, and way of life of upper castes (Srinivas 1962; Shah 2005). This process is called Sanskritization. For example, an individual (or a group) belonging to Shudra jati may become vegetarian, worship the gods that upper castes worship, and even recite Sanskritic hymns as part of its regular prayers, thus claiming status mobility (but not mobility in the ritual hierarchy). Sanskritization is an informal and voluntary process that does not involve participants’ merging their identities with the caste whose way of life they imitate, nor will the higher jati welcome...
them to its fold just because they adopted their ways. Sanskritization is most effective when it occurs at the group level. However, the basic nature of ascertainment continues. For example, an African American can earn high status in terms of his accomplishments, but his ascriptive status remains unchanged—he is not white. Likewise, an untouchable in India can rise to the position of president of India, but he is still characterized in the media as first untouchable to become president: his caste identity precedes his accomplishment.

A fourth factor that facilitates the continuity of caste is endogamy. The vast majority of marriages in India are still arranged by elders who ensure that their children marry from their own caste. However, a recent report in a south Indian newspaper titled “An Arranged Love Marriage” refers to the flexibility that is emerging in arranged marriages (Deccan Herald). Such marriages are becoming common among the urban middle class when future partners who belong to same caste (and perhaps, class too) meet at work and go on “dates.” When they find they are mutually suitable, the couple seek the consent of their parents who are more than willing to bless the union since it liberates them from the hassle of dowry negotiations, etc. And yet, this is still an urban phenomenon occurring only among a minority of those who are in the marriage market.

SOME VISIBLE CHANGES IN CASTE RELATIONS

Some aspects of the traditional caste system are changing, especially in urban areas. First, the inheritance of occupations by birth is no longer common except among the Dalits, especially in rural areas. More urban Dalits have succeeded in availing themselves of affirmative action measures. Furthermore, those of lower castes who live in urban areas have greater access to higher education, which makes them more competitive in the job market, especially in the private sector, where reservation policies are not applicable. At the time of this writing, the government of India has proposed to increase quotas for Old Backward Classes in all centrally funded institutions such as the Indian Institutes of Management, Indian Institutes of Technology, and others. This move has resulted in a public debate about the continuing centrality of caste in admission policies which in the end works against value of merit (for details see India Today).

Second, although restrictions based on purity and pollution continue to shape social distance and interactions between high and low castes in villages of India, where roughly 70 percent of India’s population resides, they are becoming increasingly hard to observe or enforce in large towns and cities. Although it is easy to identify a Dalit in a small village, it is not that easy to identify a Brahmin or a Dalit among, for example, public-transit passengers in a large city. As Indian society becomes increasingly modern, the norms of purity and pollution that are central to the traditional caste system are weakening.

Finally, traditionally caste-based dietary practices are eroding, especially in urban areas, due in part to the way in which nonvegetarian meals are packaged, especially in Western fast-food outlets. Many upper-caste Hindus may not cook meat in their homes, but they have few qualms about breaking dietary taboos in McDonald’s, Pizza Hut, or similar fast-food outlets, which are becoming fashionable dining places for urban upwardly mobile Indians.

OTHER RELIGIONS AND CASTE

Many of the religions that entered India during the last five to ten centuries targeted poor and marginalized castes for conversion, but becoming a Christian or Muslim did not accord converts a status free of caste. Instead, for the vast majority, their caste identities stayed with them, and their children and grandchildren have been unable to shed them. At the same time, the converts have been denied by many legal jurisdictions the constitutional benefits of Scheduled Caste and Scheduled Tribe status. Recent attempts by those who converted to Christianity from the lowest castes of Hinduism (Scheduled Castes) to claim Scheduled Caste status and thus eligibility for constitutionally guaranteed benefits have not been successful. The same failure has greeted attempts by individuals in some regions of the country whose status is in proximity to Scheduled Castes, such as dhobis (washermen) and chamars (leather workers). In fact, conversion of a Dalit, who is Hindu by definition, to Christianity has not been advantageous to many. It might have given them a sense of hope and status but it also deprived them of some privileges that their old status as oppressed Hindus, entitled by the constitution to certain privileges, afforded.

Features of caste continue even in those religions such as Sikhism that emerged in protest against the rigidity of Hindu rites and rituals and, more importantly, against the ascriptive caste system. Over time, social divisions resembling caste hierarchy became part of Sikh society as Sikhs strongly protected and promoted their identities as Jat, Mazabi, and Ramgarhia Sikhs, with claims to superiority over each other and norms of endogamy.

Buddhism arose around the sixth century, partly in protest against the Hindu caste system. Although its founder was a Kshatriya, the most likely candidates for conversion have come from lower castes. While Buddhism extended its influence beyond the shores of India, it was not a great success in India until the 1950s, when Dr. Babasaheb Ambedkar, a Dalit who gave independent India its constitution, encouraged fellow Dalits to convert to Buddhism; millions did, and some still continue to do
so. However, conversion to Buddhism (just as in the case of Christianity) did not amount to renunciation of one’s caste identity. Although changing one’s religion may be an act of protest against the caste system, Buddhist converts are reluctant to renounce their caste identity because they still want to obtain the benefits that the Dalit status entitles them to under the Indian constitution—a situation which is contradictory because converts to Christianity are not entitled to similar privileges.

CASTE OUTSIDE INDIA
In the late nineteenth and early twentieth centuries Britain, the colonial ruler of India, encouraged Indians to migrate to its other colonies in the Caribbean and Africa as indentured laborers in its bid to maintain its economic success. Most of the Indians who chose to migrate were members of lower castes who saw migration as an opportunity for upward mobility. Although the first generation of immigrants tended to retain their caste identities, particularly in matters of marriage and religious rites (Schwartz 1967), subsequent generations did not, because of the assimilative nature of economic, political, and juridical forces (Morwani, Gosine, and Barot-Motwani 1993; Gosine and Narine 1999). Caste cannot be easily transplanted to an environment where Hinduism is not the operative religion.

Systems of stratification comparable to the Indian caste system have been identified in other parts of the world. For example, in Nigeria the relations between the Ibo and Osu groups are similar to those of upper and lower castes. In Somalia a social group called Midgam or Madibhan suffers from all the impediments that Dalits experience: impurity, pollution, and social distance. The Burakumin of Japan have been compared with the Dalits, as they have faced similar restrictions. These restrictions were outlawed in 1871, but, as in the case of Dalits, discrimination continues, especially in matters of employment and marriage (Henshall 1999). These dichotomous divisions, however, do not come close to the intricate caste system. At best, they compare two opposite ends of caste system with another system similar to it, ignoring the middle, wherein lies the heart of caste system.

Even though there have been stout rejections of the claim that caste can be equated with race (see, among others, Gupta 2001) purely on the grounds of universal practices of discrimination based on ascription, scholars such as Gerald Berreman (1960; 1972) have attempted to compare American blacks to untouchable castes in India. However, the black-white dichotomous system in the United States differs from the fourfold caste system in India in that it is ordained not by religious considerations, but by economic and social ones (Cox 1948).

Nearly all societies are stratified in one way or another, and some groups will always be relegated to the margins. However, the Indian caste system is unique because of its complexity, its religious foundation, its hereditary occupational system, and its norms of endogamy. More important, caste has served to energize Indian polity because it has been a primary means of motivating and mobilizing citizens to take part in electoral politics. Perhaps that has been a positive aspect of caste in Indian society, but the time may come to look for other means of motivating the electorate in India.

CASTE, ANTHROPOLOGY OF

The term caste refers, paradigmatically, to a social institution in India and elsewhere in South Asia in which endogamous descent groups, known as castes or subcastes, are hierarchically ranked. It has also been used to described hereditary forms of social stratification in non–South Asian contexts, such as Japan, the American South, and elsewhere. The validity of usage outside of South Asian contexts, however, ultimately turns on how we are to understand the paradigmatic Indian case—a matter of considerable and ongoing debate. This article therefore confines itself to the study of caste in India, from its emergence in the colonial period to today.

BEGINNINGS OF CASTE THEORY

Throughout South Asia individual castes and subcastes are referred to as jāti, an Indo-Aryan word meaning a category of related persons thought to be of the same physical and moral substance, though the word can also mean genus, species, or race and other allegedly natural types. Caste, meaning the systematic basis upon which individual jātis are organized, has never perfectly conformed to either popular or scholarly models; not only do the customs and practices of jāti hierarchies vary from region to region, they also are commonly interpreted in different ways even within a single village. All this has been well known since the colonial period. But while scholars had a growing appreciation of this empirical complexity, their basic interpretive framework remained, until recently, remarkably stable.

From the late eighteenth century, the colonial picture of caste society was shaped by Brahmin informants who regarded caste as a religious matter and who saw local jāti hierarchies as depending on the scriptural theory of varṇa—an idealized four-fold social division that proclaimed the spiritual authority of the brāhmaṇa (Brahmin) superior to the worldly power of the kṣatriya (warrior/king), who it enjoined to enforce brahminical law over the vāsya (merchant) and śūdra (laborer). Colonial observers construed brahminical ideology as historical reality: The wily Brahmin had devised a hidebound social order that locked each caste into a particular occupation serving elite interests. Preoccupied with their own racial distinction, colonizers furthermore envisioned low-ranked laboring castes as conquered indigenes and high-ranked castes as the descendents of ancient Aryan colonizers. The guiding thread of colonial caste theory, however, was an orientalist notion of religious determinism—namely, that an elaborate ritual code had engendered universal respect for brahminical authority, enabling high-ranked castes to maintain unbroken control over the toiling masses for millennia.

THE RITUAL CONSENSUS

Speculative histories and detailed catalogues of caste-based customs dominated colonial anthropology until systematic village-based fieldwork in the 1950s looked at these customs’ everyday context to see how caste actually worked. That more sophisticated approach, which the influential Indian anthropologist M. N. Srinivas exemplified, helped undermine stereotypes of caste society as static and passively determined by religious ideology. Srinivas showed that wealth and physical force often trumped mere ritual (1959), and that, although an individual’s ritual status was indeed fixed by their jāti, whole jātis could sometimes increase their status by adopting the customs of higher-ranked castes (1956). Srinivas’s important insights nevertheless remained within the received picture of the caste system as an essentially religious affair by treating the control of land and servile labor, merchant capital, the state, and sheer physical dominance—all of which were termed secular—as extrinsic factors that might interact with caste, but were not an inherent part of it.

The tendency to idealize caste as inherently distinct from these less exotic aspects of social reality was taken to a new extreme by French sociologist Louis Dumont, whose Homo Hierarchicus went so far as to attack empiricism itself as “Westernistic” and therefore incapable of grasping caste’s true, Indian essence (1980 [1966], p. 32). For the closer anthropologists had looked, the more caste appeared to be but congeries of variable and even contradictory elements, its singular essence reduced to a vanishing point. If such an approach were “logically carried out,” Dumont had observed in 1958, “we should have to pretend … that India is a mere geographical entity [i.e., lacking a singular cultural essence] similar to Africa” (p. 50). Dumont’s solution was to redefine the object of inquiry itself as being, not the messy realities of everyday life, but the flexible ideological principle that rendered such realities coherent. He named this principle hierarchy, newly defined as a universal consensus of values pervading all levels of society and cognition, subordinating the individual to the social whole, political and economic power to the spiritual authority of brahminical religion, and the substantial historical realities of jāti to the timeless ideal of varṇa—all of which he explained as the hierarchical “encompassment” of the impure by the pure. Those who saw caste as exploitative or as stifling individual freedom had simply failed to grasp the reality of a culture that simply does not accept the West’s egalitarian and individualist ethic. Exploitation cannot exist in a caste society, Dumont reasoned, because “an economic phenomenon [like exploitation] presupposes an individual subject,” whereas in caste society, “everything is directed to the whole … as part and parcel of the necessary order” (1980 [1966], p. 107).
Dumont’s brilliant synthesis of the existing scholarship made *Homo Hierarchicus* a standard reference for all future discussions of caste, despite disagreement over its visionary epistemology. At one extreme, American anthropologist McKim Marriott (1976) embraced an all-determining cultural hiatus between India and the West even more absolute than Dumont’s, for the secular factors Dumont had merely downgraded to a subordinate level were dissolved entirely in Marriott’s *ethnosociology—an account built completely on native categories, thereby consigning non—culturally recognized reality to theoretical oblivion. On the other side, many sober-minded anthropologists continued to regard both secular realities and caste ideology as a matter of empirical inquiry, while nevertheless accepting the culturalist definition of caste as ritual order.

**POST-DUMONTIAN CRITIQUE**

This picture, however, would soon be questioned by two distinct groups of researchers: ethnographers studying the lowest-ranked “untouchable” castes (today called Dalits), and historians investigating transformations of native society under colonial rule. Both questioned the social and political bases upon which official knowledge about caste had been produced; both ceased to assume that caste had some singular cultural essence, analyzing it instead as a composite phenomenon intrinsically and irreducibly involving relations of power.

Throughout India the panoply of local caste differences are overshadowed—especially in the traditional heartlands of deltaic civilization—by a singular social division today commonly identified with a ritual distinction between “touchable” jātis and “untouchable” ones. The latter, whose jāti names were once used interchangeably with terms for slave, remained largely beyond the pale of Hindu society until the early twentieth century. Quintessential outsiders, Dalits were paradoxically indispensable to the very existence, symbolic and material, of caste society: Compelled to remove polluting substances, their labor guaranteed that others remained pure; hereditarily tied to producing for others, they underwrote other castes’ material privilege. Were “untouchables” consigned to a life of hard agricultural labor on account of their impurity, or was being coded impure and assigned polluting tasks simply part of what it meant to be under the total domination of others? One can abstract a noetic model of ritual purity from the complex social phenomenon of caste, à la Dumont, but it is unclear why caste itself should be defined by the result of this exercise. Not only would this seem to reduce the anthropological explanation of a society to that society’s own self-understanding, it was also far from clear that what Dumont described was not simply the view of some Indians but not others. As anthropologist Owen Lynch (1977) would argue, Dumont’s claim to have accessed a civilizational truth encompassing all socially locatable and interested representations amounted to a form of theoretical solipsism. Specifically, Dumont’s synthesis had ignored the testimony of the most dominated peoples, prompting Dalit specialist Gerald Berreman to dismiss it as merely the “rationale for a system of institutionalized inequality as advertised and endorsed by its … beneficiaries” (1971, p. 23), which only seemed plausible in the context of an anthropological tradition that had itself habitually privileged certain forms of representations and discounted others.

It would be wrong to assume, however, that anthropologists’ neglect of the subaltern evidence meant they had simply reproduced the timeless ideology of elites. On the contrary, considerable evidence suggests that much of what anthropologists—as well as most Indians—have come to recognize as caste is a fallout of colonization and the practices by which colonizers sought to know and control the colonized. Research by historian Nicholas Dirks (1993), for instance, suggests that the subordination of kingly power to brahminical ritual, seen by Dumont as Hindu civilization’s timeless truth, was in fact the handiwork of colonial power, which had reduced indigenous kings, for the first time in history, to a purely symbolic and genuinely inferior status. With the political authority of India’s autonomous kingdoms no longer the legitimating framework for localized jāti arrangements, something quite new was born. As historical anthropologist Bernard Cohn (1984) showed, the novel idea that geographically and culturally distant jātis composed a single ritual order became an institutional reality, when, in the 1870s, census officials began to publicly rank all castes on this basis.

The claim is not, Dirks (2001) has stressed, that the British invented caste *ex nihilo*, but that they conceptually and administratively redefined it. Once formed and conceptualized within multiple, local logics—military, agrarian, mercantile, and (in the signal case of the Brahmin) religious—all of which were intrinsically political, caste was now subsumed under a single, allegedly apolitical, specifically Hindu, and pan-Indian social order. Defining caste religiously—as the ritual essence of a newly imagined Hindu community—made outsiders of Muslims and undermined real communities of allied Hindu and Muslim jātis. Dalits, conversely, were proclaimed (ritually disadvantaged) Hindus in the 1871 census, and were soon embraced as such by Hindu nationalists and reformers like Gandhi, who saw their inclusion within Hinduism as vital to national strength. Equally significant, however, was the fact that geographically disparate Dalit jātis had even been brought together into a single, officially recognized category. For in the 1920s they too would begin to
assert an autonomous political identity, under the leadership of Dalit statesman B. R. Ambedkar, and to reject the Gandhian claim that their interests lay with the Hindu community and caste elites.

Liberated from foreign rule, the democratic Republic of India has introduced numerous policies to protect Dalits from abuse and to better their lot (as long as they do not renounce Hinduism for Islam or Christianity), and, in the arena of electoral politics, parties representing Dalits and other disadvantaged castes have begun to encroach on what was once the preserve of caste elites. Yet Dalits remain significantly below non-Dalit counterparts in all social and economic indicators, and as Smita Narula’s well-corroborated Human Rights Watch report (1999) attests, in much of rural India dominant castes continue to stigmatize, exploit, and violently suppress Dalits. Even in more urbane settings, Dalits describe a pervasive climate of discrimination in housing, the workplace, and classrooms, and Dalit activists have sought international recognition for their plight—most prominently at the 2001 U.N. World Conference against Racism, Racial Discrimination, Xenophobia, and Related Intolerance. Indians from more privileged backgrounds, however, frequently lament Dalit antagonism as the “politicization of caste,” a development they trace to colonial divide-and-rule policies. Indeed, in the latter decades of their rule, British officials had actively sought to undermine the nationalist movement by exploiting tensions between Dalits and the movement’s overwhelmingly elite, high-caste Hindu leadership. The colonial roots of modern caste politics, however, go deeper and are more tangled than this observation implies. For claims about a “politicization of caste” are every bit as political and socially locatable as the Dalit activism they decry, and—by representing caste as formerly distinct from the political—are less a critique of colonial caste policy than the restatement of its fundamental premise.

CASTRO, FIDEL

1926–

Fidel Castro, a first-generation Cuban, was born August 13, 1926, to a wealthy farming family in the eastern region of Oriente. Their 11,000 hectares produced wood, sugarcane, and cattle. His father had migrated from Galicia, Spain, while his religious peasant mother had been born in Cuba of Spanish parents. Both parents learned to read and write although neither went to school. Fidel Castro was one of six children.

CASTE SYSTEM, INDIA
SEE  Caste.

CASTRATION
SEE  Sterilization, Human.
When Castro was three years old, the worldwide economic depression hit rural Cuba. From 1929 to 1933 the island experienced widespread social and political upheaval, culminating when Fulgencio Batista (1901–1973), a sergeant, led a military revolt that put a radical government in power. Batista, at the behest of the American ambassador, then overthrew it and continued to dominate Cuban politics until 1959.

Castro initially went to a small rural school. At age six, in 1932, he left for a private Catholic elementary boarding school in Santiago de Cuba. Later he went to the leading elite Jesuit secondary school, Colegio Belén, in Cuba's capital city of Havana. From the Spanish priests he learned self-discipline. In 1943 he earned an award as the country's best secondary-school athlete. During school breaks, he visited the family farm and read newspaper reports about the Spanish Civil War (1936–1939) or World War II (1939–1945) to his parents and workers. In the Spanish conflict, his family supported Francisco Franco (1892–1975).

ENTERING POLITICS
In September 1945, at the age of nineteen, Castro entered the University of Havana. The campus was his springboard to national politics. Just the previous year, national elections had allowed the Partido Revolucionario Cubano (PRC), also known as the Auténtico Party, to set up a government. The PRC promised major social reforms and greater national independence. Castro immediately became involved in the tumultuous politics of the time. Students and professors transformed courses into discussions of Cuba's social, economic, and political problems.

In 1947 he participated in setting up a new populist political party, the Partido del Pueblo Cubano, or Ortodoxo Party, which had separated from the PRC. The Ortodoxos shared the same values as the PRC but claimed the Auténtico government had failed to deliver on its promised reforms and instead had become thoroughly corrupt.

Early in his life Castro had absorbed anticapitalist ideas based on Catholic counter-reformation conservative thought. While attending high school, he discovered the nationalist, anti-imperialist revolutionary writings and biography of the Cuban patriot José Martí (1853–1895). At the University of Havana he became acquainted with radical works, including those of the German political philosopher Karl Marx (1818–1883) and the Russian Communist leader Vladimir Lenin (1870–1924). He claims that in those days he became a utopian socialist and cites Martí as his primary influence.

During his university years, from 1945 to 1950, Castro was a political activist. In September 1947 he joined an armed expeditionary force composed of Cubans and exiles from the Dominican Republic intending to oust the government of the dictator Rafael Leónidas Trujillo (1891–1961). The invasion was never launched. The next year, in April 1948 as a representative of the Law Students Association of Cuba, Castro went to a Latin American University Students Congress in Bogotá, Colombia, which coincided with the United States' initiation of the Organization of American States and the advent of civil war in Colombia. The populist leader of the opposition was assassinated. For two days Castro participated in some of the early armed skirmishes, and then he returned home. Both incidents indicate that he, like many contemporaries in Cuba, identified with political struggles in the region. He was also involved in a political organization promoting the independence of Puerto Rico. By then he had acquired lifelong contacts with Latin American progressive political parties and leaders.

He graduated in 1950 with a law degree, having specialized in international law and social sciences. His main interests were politics, sociology, history, theory, and agriculture. As a student leader, radio commentator, and investigative political journalist, he developed a significant following among young people. The Ortodoxo Party recognized his oratorical and organizational skills and nominated him for the planned June 1952 national congressional election. However, on March 10, 1952, the military, led by Batista, carried out a second coup d'état, ending hopes that electoral politics could reform the island and throwing Cuba's constitutional system into a crisis.

ARMED REVOLUTIONARY
Like many other political reformists, the young Ortodoxos became committed revolutionaries, clandestinely organizing to oust the new military rulers. On July 26, 1953, civilians led by Castro attacked Santiago de Cuba's Moncada army barracks, the second largest in the country. It ended in failure. Some men were killed in the confrontation; others were captured and then assassinated. The survivors ended up in prison. From the summer of 1953 to May 1955, Castro was imprisoned at the Isle of Pines, but he continued to organize his associates inside and outside prison. He also read about political, economic, and social matters. In mid-May 1955, the Moncadistas were granted a political amnesty. Batista hoped such a move would earn him legitimacy. It did not. Meanwhile, by serving time, Castro had become one of the primary national opposition leaders in Cuba.

He spent May 1955 to November 1956 in exile in Mexico, where he organized and trained a guerrilla force. On December 2, 1956, eighty-two men who had embarked from the Mexican port of Tuxpan days earlier landed in Cuba in the southern portion of the Oriente.
The guerrilla insurgency had begun. The guerrillas gained control of significant portions of territory, launched an agrarian reform, recruited peasants, and created an alternative set of political institutions. Castro broadcast daily from a rebel shortwave radio station. From the Sierra Maestra Mountains, he coordinated the military and political struggle. From 1957 to 1958 the guerrillas were able to build a multi-class popular front against the dictatorship.

On December 31, 1958, the Batista military regime and political machine collapsed. This was a first in Latin America: a rural insurgency that defeated a regular military force supported by the U.S. government.

REVOLUTIONARY IN POWER
On January 1, 1959, less than six years after the initiation of open opposition to the Batista regime, Castro's revolutionary forces seized power. The Cuban revolution was about to begin. The fundamental questions of how the society's institutions would be organized and what the relationship would be with the United States and Latin America soon became paramount issues as the multi-class alliance that had supported the guerrillas fractured. Portions of the bourgeoisie and the middle classes wanted a return to a constitutional government without affecting social and economic institutions. However, landless peasants and the seasonally unemployed, among others, favored radical changes.

Moreover, the Cuban revolutionaries were aware of the political processes unfolding in Asia, Africa, and the Middle East. While the United States and the Soviet Union were engaged in the cold war, third-world countries were addressing the pressing problems of national independence, integration, decolonization, and socioeconomic development. Some of the same issues needed to be addressed in Cuba.

Even before the guerrillas left the Sierra Maestra, the U.S. government tried to prevent them from seizing power. Also, the United States gave political refuge to Batistianos, allowing them to plunder Cuba's national treasure. In January 1959, right-wing Batista forces in exile in the United States began hit-and-run attacks by air and sea, but the U.S. government turned a blind eye. Foreign relations between the two governments deteriorated rapidly.

Moderates and radicals within the new revolutionary regime immediately discovered the interconnection of domestic and foreign policy. Attempting to distribute land to the landless created confrontation with the United States because the best land was owned by American corporations. Increasing wages also affected American-owned corporations. Import-export policy impinged on the businesses that did precisely that, mostly American ones.

Moreover, the administration of President Dwight D. Eisenhower (1953–1961) had no intention of forfeiting American privileges enjoyed since 1898.

Nevertheless, the Cuban nationalists sought to bring about unprecedented independence. Any attempt to reform Cuba's social, economic, and political institutions would create confrontation between the two countries. American opposition only contributed to the radicalization of the revolutionary process.

Cuba had a mono-export economy, with one major buyer (the United States), yearly cyclical high unemployment, and much social inequality. Cuba was a poor and underdeveloped country, although different in one respect from other nation-states in the Caribbean. With Cuban capitalism so closely connected to American investments, nationalist efforts to control the country's resources easily became equated with anticapitalism. Cuban businesses did not come to the fore to defend their interests by differentiating themselves from U.S. interests. Rather, Cuban capital attached its politics and fate to the U.S. government.

RADICALIZATION OF THE REVOLUTION
The early Cuban revolutionary regime developed a three-fold strategy: a progressive redistribution of income, a radical change in the property system, and a lowering of major daily costs (such as food, rent, transportation, and public services) to benefit the lower classes. This resulted in broader political support among the lower classes and a reduction of the income and wealth of the upper classes, thus diminishing their available resources for counterrevolutionary activity.

As this radicalization advanced, the moderates within the revolutionary coalition joined the opposition or went into exile. Many members of the professions did the same. As the country lost skilled personnel, the state further centralized political, administrative, and economic resources. Facing a shortage of expertise, the revolutionary regime relied on the politically trustworthy, usually people who were radical, including Communists. Such trends further exacerbated the political climate and relations with the U.S. government.

By March 1960, the United States had begun formal covert programs to overthrow the government and kill its leaders. In April 1961, a Cuban exile invasion (Bay of Pigs) was organized, trained, financed, and directed by the Central Intelligence Agency. The fact that it was defeated by the Cubans reinforced the United States' commitment to oust the revolutionaries. The John F. Kennedy administration (1961–1963) further retaliated by organizing a second expeditionary force and imposing an economic embargo in February 1962.
NUCLEAR GAMBLE AND RELATIONS WITH SOVIETS
Havana and Moscow replied by surreptitiously installing tactical nuclear weapons on the island in 1962. Interestingly, Castro urged the Soviets to announce to the world that missiles were going to be installed as a matter of sovereign right on the part of Havana. The Soviet premier, however, did not listen to his advice.

Between April 1961 and March 1962, Castro removed key pro-Soviet Communists from critical positions in the government and the economy while negotiations with Moscow on missile installations were conducted. After October 1962, because of the way the Soviets handled the resolution of the Missile Crisis (Cubans were not informed of the negotiations), relations cooled. Havana made numerous moves to publicly assert its independence. The Soviets put up with Cuba questioning their position on the Sino-Soviet conflict, on the electoral politics of Communist parties in Latin America, the methods of building socialism, and the importance of politics based on moral rather than materialist perspectives. Havana, in other words, was to the left of Moscow. Such were the tense relations until 1972.

From 1972 to 1985, on domestic matters Cuba followed policies that were in accord with the Soviet model, but Castro constructed a foreign policy that challenged the Soviets. This was the case in Angola (1975), Ethiopia (1977), Nicaragua (1979), and an international organization called the Non-Aligned Movement (NAM; 1979). In 1980, Moscow informed Havana that it would not defend the island if U.S. military forces were to attack. Cuba had to develop its own military doctrine and structure from that point on. Thereafter, the political and ideological distance between the two countries grew, even though the island depended on Soviet economic subsidies.

From 1985 to 1990, Castro elaborated a critique of the old Soviet model while rejecting the reforms of Soviet leader Mikhail Gorbachev. The government in Moscow responded by further reducing assistance.

SPECIAL PERIOD
The demise of the Soviet bloc from 1989 to 1991 had major domestic implications in Cuba. It initiated the most difficult economic period in the history of the island—the so-called Special Period.

The United States took advantage of that juncture to increase Cuba’s economic isolation. It was an extraordinary accomplishment that Castro’s regime adapted its policies and survived. Moreover, by 2000 the island had slowly begun to regain the economic standards it had enjoyed in the early 1980s.

To break away from American-imposed isolation policies while distancing itself from the Soviets, Cuba developed a global foreign policy. Castro cultivated a personal relationship with key political, social, and cultural leaders from Africa, Asia, and Latin America. His close friends have included such nationalist progressives as Nelson Mandela (b. 1918; South Africa), Lázaro Cárdenas (1895–1970; Mexico), Omar Torrijos (1929–1981; Panama), Juan Bosch (1909–2001; Dominican Republic), Salvador Allende (1908–1973; Chile), Daniel Ortega (b. 1945; Nicaragua), Juan Domingo Perón (1895–1974; Argentina), Sékou Touré (1922–1984; Guinea), Ahmed Ben Bella (b. 1918; Algeria), Luiz Inácio Lula da Silva (b. 1945; Brazil), João Goulart (1918–1976; Brazil), Josip Broz Tito (1892–1980; Yugoslavia), Jawaharlal Nehru (1889–1964; India), and many others. The closest of all associations has been between Castro and Hugo Chávez (b. 1954), the president of Venezuela beginning in 1999. The older man recognized the revolutionary qualities of the Venezuelan as early as 1994. The two have similar national histories with a heavy reliance on mass mobilization. Chávez, however, attained and has maintained political power through electoral politics. Moreover, while the younger man respects the elder statesman, there is a unique reciprocity of respect and influence. Castro provides political and tactical advice, and Venezuela’s economic resources have permitted Chávez to help Cuba surmount the economic crisis that began in 1991. Radical and revolutionary ideas and organization have been extended by their alliance beyond anything that Castro could have imagined.

In 1961 the Non-Aligned Movement was established in Belgrade, Serbia. Cuba was the only country from Latin America that was a founding member. In 2007 the NAM had 118 third-world countries. Twice Castro has been elected to lead the organization, an explicit mark of esteem for the political example and strategic perspectives of the Cuban revolutionary. Thus, Cuba has become identified with selfless internationalism, sending assistance, for example, to Angola, Mozambique, Nicaragua, Grenada, Venezuela, Algeria, North Vietnam, Ethiopia, Pakistan, and Haiti.

Once the Soviet Union and its Eastern European allies were gone, the government in Havana devised more activist policies toward the third-world nations, providing them with the human capital the island had been so successful in creating, particularly teachers, doctors, dentists, and technical people. In January 2007, Cuba had diplomatic relations with 183 countries.

Relations between the United States and Cuba have gone through different periods, but they have never been friendly. Full diplomatic relations were broken by the United States in January 1961. Thirteen months later,
normal economic transactions were terminated by Washington. Only during the administration of President Jimmy Carter (1977–1981) was there a brief period during which some diplomatic ties were restored and travel between the two countries resumed. However, during the administration of George W. Bush (starting in 2001), travel to the island from the United States was highly restricted, including family and academic travel. Cuba cannot use the U.S. dollar in any international transaction, receive international credits, or use any banking institution tied to U.S. capital. Third parties outside the United States are also pressured not to engage in trade with the island. The degree of U.S. financial support to the opposition has increased, and the economic blockade/embargo has been heightened. Every year, the United Nations’ General Assembly overwhelmingly votes against the U.S. policy, but the policy remains.

REVOLUTIONARY LEADER

Castro has been the paramount strategist, executive officer, ideologist, and macromanager of the revolutionary regime. He has been the revolution’s main leader, spokesman, and coalition builder. Relying on historical reference, example, and metaphor, he has taught that action is the best educator. A radical nationalist, he integrated Martí and Marx. His political thought is rooted in ethical values rather than materialist theory. He has synchronized socialist European traditions with third-world customs while recognizing that each country must find its own way. He has dealt with development theory, nation building, internationalism, foreign debt, globalization, sustainable development, social justice, party building, and human psychology. Since the 1950s his political strategy has stressed unity among revolutionists. Mass mobilization has been a constant instrument and has included the literacy campaign, childhood vaccination, the creation of a territorial militia, and anticorruption campaigns.

Since 1959 resources have been concentrated in the rural areas and small towns, and the city of Havana has suffered. An ideology of inherent rights and entitlements has developed with a system that provides universal education, health and dental care, child care, and burial service free of charge. The state also assumes the responsibility of providing employment or giving the unemployed financial support. Cuba is one of the most educated countries in the third world, with a life expectancy of 77.5 years and an infant mortality rate of 6.5 per 1,000 live births (as of January 2007). Education and health claim 23 percent of the gross internal product. The number of libraries, schools, hospitals, and dams increased dramatically from 1959 to the mid-1980s. Food has been subsidized since 1962, but it has been rationed as well. Just as libraries lend books, there are also centers that lend musical instruments at no cost. Every municipality has computer clubs where access is free. Thirteen percent of the population benefits from universal social security, and 4.2 percent receives social assistance checks.

The political system has changed from its original high dependence on charismatic leadership based on mass popular organizations (1959–1976) to a formal institutionalized political regime where officials are directly elected by the population, with no campaigning or Communist Party–proposed candidates. Still, charismatic authority continued to operate to balance and control the administrative state. Castro’s contact with the population, which began in 1959 through mass rallies, has been preserved. He has been the unifying and integrating force among disparate factions in the revolutionary family.

Cuba does not permit alternative political parties or a political opposition to openly publish political materials. However, thirty-two Catholic publications do express positions that are opposed to the government, although in a subtle fashion. The political leadership maintains, based on Federalist Paper No. 8 by the U.S. founding father James Madison (1751–1836), that the external threat posed by the U.S. government’s policies—including confrontation, isolation, invasion, financial assistance to opponents within the island, and an economic embargo that has lasted more than four decades—do not provide much space for a political opposition.

By the end of July 2006, Castro had transferred political power, in a provisional manner, to his brother and other individuals in what constitutes the establishment of a collective leadership. The question for most foreign observers is whether the Cuban revolution will survive the death of its leader. History will tell.

Much of quantitative social science (such as principal factor analysis, linear regression, and least squares) seeks linear relationships among many variables. “Nonlinear” methods often seek to warp variables to bring them into linear relations, just as taking logarithms changes exponential growth into correlation with time, but allow more transforms. This approach fails for topologically nonlinear relationships such as (see Figure 1) the condition \( x^2 + y^2 = 1 \) between \( x \) and \( y \). Knowing the value of \( x \) limits what is possible for \( y \), but evenly scattered points \((x,y)\) on the circle show no linear correlation between \( x \) and \( y \), and no principal factor in any direction. No transformations of the variables improves this.

A mutual information test would reveal a link between \( x \) and \( y \), but say little about its structure. Local analysis says more. The region \( D \) shows a strong linear relation between \( x \) and \( y \), just as linearly testing temple attendance versus income on one Delhi suburb works better than on worldwide data. Around the points \( A \) or \( B \), fitting a linear \( Y(x) \) reveals little: \( y \) is no function of \( x \) there (or at \( P \) and \( Q \), vice versa). Nevertheless, \( x \) and \( y \) have a fold relation of a very common type. Just as “more equations than unknowns means no solutions,” almost every failure of a \( Y(x) \) model for an \((x,y)\) curve is a fold. With a smooth reparametrization it fits a piece of parabola.

Globally there may be more than one fold: Figure 2 shows a more common relation between the two than the circle. This is more common partly because it can arise as part of the cusp (see Figure 3), which Hassler Whitney in the 1950s showed to be the almost-universal local relation between two surfaces where they cannot be adjusted to a linear or fold description.

René Thom in the 1960s developed a more general theory. This emphasizes the curves, surfaces, and so forth, arising as sets of minima, maxima, and other level points when changes in an external factor modify a function \( F \) of a multivariable internal \( x \). Level points (energy-minimum equilibriums, etc.) represent simpler long-term behavior than limit cycles and chaotic attractors, and Thom thus referred to this as “elementary” catastrophe theory.

**CATASTROPHE THEORY**

**Figure 1**

**Figure 2**
“General” catastrophe theory would include changes of chaotic regime, but the term has settled on the narrower use. The cusp, fold, and so on arise in both contexts. The \((a,b)\) plane in Figure 2 generalizes the “phase diagram” of thermodynamics: crossing \(P\) changes which minimum is the deepest, while crossing \(B\) changes which minima even exist. Some systems always adopt the deepest minimum, others hold to a minimum until it vanishes, but in either case a smooth change in \((a,b)\) can force a jump in \(x\). The external factors might be, for example, gross economic indicators, while \(x\) represents all the alternatives of hiring, capital expenditure, shift timing, and so forth, over which a firm must maximize profit \(F\)—subject to the modifying external factors. (Figures 2 and 3 gray out states such as local minima of profit or maxima of pain, which a system actively avoids.)

Rigorous treatments of the mathematics include the work of V. I. Arnold, while Tim Poston and Ian Stewart aim at a wider scientific audience. Remarkably, the fold and cusp structures arise regardless of any (finite) number of variables needed to describe \(x\). For 1-D and 2-D external factors, with scalar \(F\) and in the absence of special symmetries, any other structure falls apart into cusps and folds as easily as three planar lines through a common point fall into three crossings. They can occur in multiple places, such as the two folds in Figure 2, and in continua for \(n\)-D externals, such as the fold curve \(C\) (not isolated fold points) in Figure 3, but 1-D and 2-D externals make them the universal local forms or “elementary catastrophes” (suggesting in French sudden discontinuity, as in departing “en catastrophe,” but not necessarily disaster). Three external dimensions allow three more of these forms: 4-D gives another two, for the total of seven, which caught media attention. In higher dimensions they can still be classified, and have been applied in quantitative physics, but arise in continua of types rather than a small finite set. When the function \(F\) is replaced by vector dynamics, there are discontinuities (such as onset of oscillation or chaos, and self-organized criticality) not covered by this “elementary catastrophe” list.

Physics, engineering, and, increasingly, biology have successfully applied the methods by which the classification is reached, usually as part of the general “bifurcation theory” toolkit, to nonlinear models with precise data. Research in the social sciences has often attempted to use the classification theorem, not always appreciating the reparametrizations essential to it, or its local nature (folds and cusps are often multiple). Social complexity and noisy social data require multivariable models and statistical tools, even when a linear model is possible. A nonlinear model with few parameters can sometimes replace a linear one with many, as Johannes Kepler’s (1571–1630) three laws replaced the hundreds of circles of Ptolemy (2nd century CE) and Nicolaus Copernicus (1473–1543). More often, essential nonlinearity in a few key directions must be combined with linearizability (differentiability) in many other directions: simply superposing the \((b,x)\) folds around \(C\) in Figure 3, without adjusting for \(a\), masks their structure. Bifurcation modeling for the social sciences must include tools such as principal factor analysis, not replace them. This extended theory is not yet in place, but the work of Courtney Brown represents important progress.

CATTLE INDUSTRY

The cattle industry is one of the world’s most important agricultural enterprises. According to the United Nations, there were over 1.37 billion cattle worldwide in 2004. On a percentage basis, approximately 35 percent of these animals were in Asia, 23 percent in South America, 17 percent in Africa, 12 percent in North America, 10 percent in Europe, and 3 percent in Australia and Oceania. While this distribution is slanted toward Asia and South America, the livestock systems and uses of cattle vary substantially by location. For example, cattle often have dual purposes, particularly in Asia, where cattle are often used principally for traction and secondarily for meat and milk. In North and South America, however, cattle are used principally for meat and milk products.

According to William Lesser, a professor at Cornell University, cattle have been domesticated for several thousand years. He suggests that domesticated livestock provided early societies with four important functions: (1) a supply of high-quality protein, (2) the ability to store foodstuffs not directly consumable by humans, (3) hides for clothing and shoes, and (4) motive (traction) power (Lesser 1993, p. 31).

Lesser indicates that prior to the Industrial Revolution, cattle systems were relatively primitive. Cattle were kept without shelter, for example, and they had to forage for themselves. However, with the rise of the modern city during the Industrial Revolution, the cattle industry evolved from being a very local industry—where cattle generally provided traction, meat, leather, and livestock products for individual families—to an industry organized to produce cattle products that were transported from rural areas to urban centers.

Cattle primarily consume various types of forage, or fodder, and livestock systems have evolved in order for cattle and other livestock to harvest forages and convert the energy contained in forages into protein. This protein is then consumed by humans primarily in the form of milk and meat. Leather produced from cattle hides is also an important material used in making shoes, other clothing items, and clothing accessories.

In the United States, the evolution of the cattle industry may be best illustrated by the large cattle drives of the 1880s, where cattle were trailed (walked) from the south-central United States to rail centers such as Dodge City, Kansas. The cattle were then transported by rail to urban centers like Chicago, where they were slaughtered and processed. The beef was then shipped to urban consumers. The era of the cattle drive was the heyday of the American cowboy. Cowboys were necessary to control the cattle herds as they moved northward. This period of American history has been romanticized, as has the role of the cowboy as an independent free spirit who battles the elements to care for the cattle under his care. Today, of course, anyone who cares for cattle could be considered a cowboy, but the American cowboy remains an icon of the American West. The South American gaucho has also been romanticized in a similar fashion. Both the American cowboy and the gaucho are known for their distinctive clothing, equipment (such as a lariat), and their horsemanship.

Important technologies for shipping cattle carcasses and marketing cattle products were developed in the late 1800s by companies such as Cudahy, Wilson, and Swift. According to Lesser, this led to the rise of modern meatpacking, which was originally conceived on the same principles as the automobile industry. Henry Ford developed the idea of the modern assembly plant at the beginning of the twentieth century. Modern meatpacking plants have used the idea of product assembly in reverse, for they are essentially large disassembly plants. In meatpacking plants, cattle are slaughtered and their carcasses are disassembled and protected by plastic wrapping. The parts are then reassembled with like parts, referred to as “cuts,” before being placed in a cardboard box for shipment. One of the most important innovations in meatpacking during the last decades of the twentieth century was the development of this boxing operation, which has largely replaced the traditional method of shipping whole cattle carcasses to butcher shops and retail outlets. Today, boxed beef is usually shipped directly to retailers, who are then required to provide only a minimal amount of additional preparation before the beef can be served or sold to the final consumer.

International trade in cattle and beef is now dominated by a few large exporting and importing countries. The United States is the world’s largest beef and veal producer, though it holds a relatively small portion of the...
total international beef market. Other large beef-exporting countries include Brazil, Argentina, Uruguay, Canada, and Australia. Large beef-importing countries include Japan, South Korea, the United States, Canada, and Mexico. As the international trade in beef has increased, animal disease control and food safety have received increased attention. For example, concerns related to standardizing trade issues affected by bovine spongiform encephalopathy (BSE, or mad cow disease) and foot-and-mouth disease have become important issues in the international beef trade. Concerns regarding input use, such as growth-enhancing hormones, and the tracking of animals and meat have also resulted in trade frictions, especially between the United States and the European Union.

Systems for producing beef in the developed world are differentiated primarily by the types of feeds used during the final stages of growing the animal prior to slaughter. This final feeding stage is referred to as “finishing.” In locations with abundant forage resources, cattle are primarily finished by grazing the animals. For instance, grass-fed beef is the primary type of beef produced in Argentina, Brazil, and Australia. In locations with abundant grain supplies, cattle are typically finished by feeding them grains. Grain-fed beef is common in North America, especially the United States and Canada.

The modern beef industry in the developed world faces a number of significant challenges. Some of these are related to the relatively small number of large firms involved in meatpacking and food retailing, which leads to fears on the part of farmers and consumers that these firms may have too much influence on prices and the variety and types of beef products that are available.

Other challenges involve building better connectivity and coordination in the marketing channel between the processes used to produce beef and the characteristics desired by consumers. For example, some consumers perceive that there are significant inconsistencies in the tenderness and flavor of beef, both of which are desirable characteristics, from one eating experience to the next. A growing number of consumers in developing countries are also demanding more information about the types of inputs and processes used to produce beef. This has led to more information being provided to consumers about beef products through labeling and certifications. For example, certifications such as “organic,” assurances about the beef being produced under “natural” conditions, and assurances about the traceability of the beef are becoming more common. Traceability is defined as being able to track the beef product backward through all handlers and processors in the marketing chain to the original farm where the animal was born.

CAUSATION

In economics and the social sciences the value of many variables (such as price of a product, crime rate, level of illiteracy, personal income, and consumption) is observed with great regularity. As a result, an empirical generating mechanism can be postulated that produces the observed values of the variable of interest. The investigation and understanding of this mechanism is one of the main tasks for social scientists and by doing so the issue of causation inevitably arises. Causation can be discussed in very general, abstract terms or the discussion can focus on the specific question of whether or not it is possible to test for causation using the data available.

The latter requires an operational procedure and definition (mechanisms and subsystems) and this formulation arises because of a lack of understanding of the working of a complex system. In this formulation, each mechanism, which might be represented by an equation, determines the value of a particular variable as a function of some others. The variable whose value is so determined (dependent or endogenous variable) is called the effect of the working of that particular mechanism, while the values of other variables entering into the mechanism (independent or exogenous variables) are the causes of that effect.

As a specific example, theoretical analysis may say that “y is a function of x,” that is, changes in the independent variable x generate changes in the independent variable y. One might write this as \( y = f(x) \). Empirical analysis then attempts to estimate the actual strength of the relationship between \( y \) and \( x \). So, empirical seeks to uncover the data generating mechanism \( y = \beta_0 + \beta_1 x \). Hence, if \( x \) increases by 1 unit \( y \) will increase by \( \beta_1 \) and if \( x = 0 \) then \( y = \beta_0 \).

Much of economics and social science is concerned with cause-and-effect propositions insofar as these disci-

Causality

plines pose causal relationships that postulate that a dependent variable’s movements are causally determined by movements in a number of specific independent variables. However, one should not be deceived by the words dependent and independent. Although many theoretical economic relationships are causal by their nature, statistical analysis, for example linear regression, cannot prove causality. All regression analysis can do is test whether a significant quantitative relationship exists, measure the strength of this relationship, and postulate the direction of the quantitative relationships involved. Regression analysis cannot confirm causality. Judgments referring to causality are made through various causality tests.

The objective of any causal analysis is to try to influence the degree of belief held by an individual about the correctness of some causal theory. Hence, the task of the analysis is not to be complete in itself, but rather to have enough value to make one consider one’s belief. There are basically two types of causal testing situations. In a cross-sectional causality analysis the question asked is why this variable behaves differently from the other. In a temporal causality analysis the question asked is why this variable changes behavior from period to period. Although many important economic questions can be phrased in the cross-sectional causal situation, they have received little causal testing in that context and many tests have been conducted for economic questions that can be stated as temporal causation. The definitions of causality and their interpretations may differ between cross-section and time-series cases. In all cases, however, the classification of variables into exogenous and endogenous and the causal structure of the mechanism (econometric model) are under scrutiny.

The relation between exogeneity and causality is the heart of any investigation into causal analysis. There are a number of definitions of exogeneity: weak, super, and strong exogeneity. A variable is said to be weakly exogenous for estimating a set of parameters if inference on the parameters conditional on this exogenous variable involves no loss of information. The concept of superexogeneity is related to the Lucas critique, which states that if a variable is weakly exogenous and the parameters in the equation remain invariant to changes in the marginal distribution of the variable, then the variable is said to be superexogenous. A variable is strongly exogenous if it is weakly exogenous and at the same time is not preceded by any of the endogenous variables of the model. The concept of strong exogeneity is linked to the concept of Granger causality, and should be considered as a test of precedence rather than causality as such. Hence, a variable is defined to be strongly exogenous if it is weakly exogenous and it is not caused by any of the endogenous variables in the Granger sense. However, in the usual simultaneous equations literature there is doubt as to what extent the test for Granger noncausality is useful as a test for exogeneity. Nevertheless, some argue that Granger noncausality is useful as a descriptive device for time-series data.

The Granger causality test is based on two axioms, that the cause will occur before the effect and that the cause contains unique information about the effect. In practice, Granger causation tests whether A precedes B, or B precedes A, or they are contemporaneous. It is not a causality analysis as it is usually understood and in this limited sense Clive Granger (1969) devised some tests which proceed as follows: consider two time series, \( x \) and \( y \). The series \( x \) fails to Granger cause \( y \) if in a regression of \( y \) on lagged \( y \)'s and \( x \)'s, the coefficients of the latter are zero. The lag length is, to some extent, arbitrary. An alternative test provided by Sims states that \( x \) fails to cause \( y \) in the Granger sense if in a regression of \( y \) on lagged, current, and future \( x \)'s, the latter coefficients are zero. Although between the two tests there are some econometric differences, the two tests basically test the same hypothesis of precedence. This is the reason that many econometricians have suggested the use of the term precedence rather than Granger causality, since all one is testing is whether or not a certain variable precedes another and one is not testing causality as it is usually defined and understood.

The causality issue arises also in forecasting problems and techniques. Forecasting is the prediction of the behavior of future events and causal models are used to derive numerical forecasts. The causal models are regression and autoregression models used to produce numerical time series forecasts. The subject of a causal model is to identify one series as the main series of interest and to use another series as the predictor for the main series. It is argued that economic theory is necessary in order to provide the information needed to specify the causal relationships, because forecasts may not involve causal relationships.

In a general formulation of a causal time series model the predictor variable (exogenous) enters the equation at the same time as a contemporaneous variable and as a lagged independent variable. Even a simple causal model is fraught with difficulties. This is typically due to the problem of distinguishing the autocorrelation between the dependent and independent variables from the cross-sectional correlation between the two. Cross-sectional correlations that appear significant but are induced by autocorrelations are called spurious correlations. The problem of spurious correlation arises because in many instances, the predictor variable is stochastic and thus we need to forecast its time series. Several causal models have been developed to cope with this problem and the most
common is the regression model with autoregressive disturbances.

The estimation of the causal effect arises also in the case of random experimentation. The central idea of an ideal randomized experiment is that the causal effect can be measured by randomly selecting observations from a population and then randomly giving some of the observations a treatment, the causal effect of which researchers then investigate. If the treatment is assigned at random then the treatment level is distributed independently of any of the other determinants of the outcome, thereby eliminating the possibility of omitted variable bias. The causal effect on $Y$ of treatment level $X$ is a difference in expected values and thus is an unknown characteristic of a population. One way to measure the causal effect is to use data from a randomized control experiment. Because the treatment is randomly assigned, the causal effect can be estimated by the difference in the sample average outcomes between the treatment and control groups.

Despite the advantages of randomized controlled experiments, their application to economics faces severe hurdles, including ethical concerns and cost. The insights of experimental methods can, however, be applied to quasi experiments that provide econometricians with a way to think about how to acquire new data sets, how to manipulate instrumental variables in their analysis, and how to evaluate the plausibility of the exogeneity assumptions that underlie Ordinary Least Squares (OLS) and instrumental variables estimation. In a quasi-experiment technique there are special circumstances that make it seem “as if” randomization has occurred. In quasi experiments, the causal effect can be estimated using a differences-in-differences estimator, possibly augmented with additional regressors; if the “as if” randomization only partly influences the treatment, then instrumental variables regression can be used instead. An important threat confronting quasi experiments is that sometimes the “as if” randomization is not really random, so the treatment (or the instrumental variable) is correlated with omitted variables and the resulting estimator of the causal effect is biased.

The issue of causality is very important in economic and social analysis but unfortunately not all analysts give the same meaning to this word. In discussing causal links, many economists emphasize the relevance of a sound economic theory in deriving causal propositions and they argue that caution should be applied in the inferences derived from the analysis.

CENSORING, LEFT AND RIGHT

Censoring occurs when values of a variable within a certain range are unobserved, but it is known that the variable falls within this range. This differs from truncation, where values of a variable within a certain range are unobserved and it is unknown when the variable falls within this range. Both phenomena represent a loss of information, but the loss is less with censoring than with truncation. The two are sometimes confused in the literature; some examples are given in Léopold Simar and Paul Wilson (2007). George Maddala (1983) and Takeshi Amemiya (1984) list a number of empirical applications where censoring occurs.

Consider a sample of $n$ draws $Y_i, i = 1, \ldots, n$ from a distribution function $F(y) = R(Y \leq y)$. If the sample is left-censored at $c_1$, then the values $Y_i$ are not observed; instead, values $Y_i'$ are observed, where $Y_i' = Y_i$ if $Y_i > c_1$ and $Y_i' = c_1$ otherwise. For the cases where $Y_i' = Y_i$, all that is known about the underlying corresponding values $Y_i$ is that they are less than or equal to $c_1$. Alternatively, if the sample is right-censored at $c_2$, then values $Y_i'$ are observed, where $Y_i' = Y_i$ if $Y_i < c_2$, and $Y_i' = c_2$ otherwise. In this scenario, for the cases where $Y_i' = Y_i$, all that is known about the $Y_i$ is that they are greater than or equal to $c_2$. Samples can also be both left- and right-censored.

In models of duration, right-censoring often occurs, but left-censoring can also occur. For example, if agents are observed in some state (e.g., unemployment, in the case of individuals, or solvency, in the case of firms) until either they are observed to exit the state or until the period of observation ends, then some agents may still be in the
given state at the end of the observation window. Observations on these agents will be right-censored. Similarly, at the beginning of the study, some (perhaps all) agents are observed to be already in the state of interest; for any agents whose time of entry into the state is unknown, their duration in the given state is left-censored (and perhaps also right-censored).

To illustrate censoring in a regression context, suppose

$$Y_i = \beta_1 + \beta_2 X_i + \epsilon_i$$

(1)

where $E(\epsilon) = 0$. If $Y_i$ is censored, then one must estimate the model

$$Y'_i = \beta_1 + \beta_2 X_i + \epsilon'_i$$

(2)

after replacing $Y$ in (1) with $Y'_i$, which necessarily results in a new error term in (2). Unless the censoring occurs in the extreme tails of the distribution of $Y_i$, ordinary least squares (OLS) estimation of the coefficients in (2) will yield biased and inconsistent estimates since OLS does not account for the censoring.

Censored regression models are typically estimated by the maximum likelihood method. If the errors in model (1) are assumed normally distributed with mean 0 and variance $\sigma^2$, then in the case of left-censoring at $c_i$ the likelihood function is given by

$$\text{LF} = \prod_{Y_i \leq c_i} \frac{1}{\sigma} \Phi \left( \frac{c_i - \beta_1 - \beta_2 X_i}{\sigma} \right)$$

$$\prod_{Y_i > c_i} \frac{1}{\sigma} \varphi \left( \frac{Y'_i - \beta_1 - \beta_2 X_i}{\sigma} \right)$$

(3)

where $\varphi$ and $\Phi$ denote the standard normal density and distribution functions, respectively. This model was first proposed by James Tobin (1958), and is sometimes called the tobit model. The first product in (3) gives, for each observed value $Y'_i$ equal to $c_i$, the probability of obtaining a draw $Y_i$ from $F(y)$ less than $c_i$.

The models presented above potentially suffer from several problems. Heteroskedasticity in the error terms can lead to inconsistent estimation. D. Petersen and Donald Waldman (1981) proposed modifications of the tobit-type models involving specification of particular models for the error variances. John Cragg (1971) proposed a generalized version of the tobit model that allows the probability of censoring to be independent of the regression model for the uncensored data. Perhaps the most vexing problem is the requirement of a distributional assumption for the errors in (2). It is straightforward to assume distributions other than the normal distribution and then work out the resulting likelihood functions, but rather more difficult to avoid such assumptions altogether by using semi- or nonparametric methods. Adrian Pagan and Aman Ullah (1999) discuss several proposals, but these involve significant increases in computational burden or data requirements.

CENSORING, SAMPLE

In order to define censoring in sample data, researchers first distinguish between latent data, the data that are hidden from the observer, and observed data, which are their measured counterparts. The latent data are modified between the original data creation and the observation by the analyst. Censoring occurs when certain values in the latent data are transformed so that their identities in the original data are masked or hidden from the observer.

A natural, familiar case is institutional censoring. Certain government statistics, such as income data on individuals and line of business data on firms, are censored to mask the identities of the persons or businesses. Thus income might be reported not as their original values, but only as being in a certain bracket. Censoring also occurs naturally in the way that certain data are observed. A leading example is the observations on durations in medical statistics. Observed data on the longevity after the
surgery of heart transplant patients, or the length of survival after onset of a disease, are naturally censored if the individual leaves the observation setting before the transition takes place. Thus the hospital may at some point lose contact with the heart transplant patient. The observation consists of the knowledge that the patient was still alive at the time of his or her exit from the study, but not how long he or she survived. In another familiar case, the true levels of demand for sporting and entertainment events are not revealed by ticket sales because the venue may sell out. The observed reflection of the demand is only ticket sales, limited by the capacity of the venue. Some economic phenomena, known as corner solutions, also lead to censoring when the observed counterpart to a variable of interest has a boundary value. Thus the amount of insurance an individual desires may be censored at zero. The amount of investment that a business undertakes might be recorded as zero if the assets of the business are allowed to depreciate, such that the true investment is actually negative.

IMPLICATIONS FOR MODELING

Models of statistical phenomena usually describe relationships between, or co-movements of, variables. Censoring interferes with this sort of modeling. (See Greene 2003 and Maddala 1983 for analysis and extensions.) Suppose that the relationship occurs between the latent variables of interest. If a variable \( x^* \) is expected to explain the movement of variable \( y \), and \( x^* \) is censored to reveal \( x \), then the analyst will measure movements in \( y \) that are associated with movements in \( x^* \) when \( x \) does not change. In the opposite case, when it is \( y^* \) that is censored and \( x \) that is not, the analyst will observe movement in \( x \) that should be associated with movement in \( y \), but is not. Either case leads to a distortion in the measured relationship between a censored variable and an uncensored one. Contemporary model builders accommodate this type of distortion by building specific models for the censoring process along with the relationship of interest. Controversy arises over the many assumptions that must be made in order to make reasonable analysis feasible. Ultimately, the estimated relationship, such as that between prices and ticket sales for sporting events, is also a function about what is assumed about the underlying process whereby true underlying data are translated into observed, censored data, for example, how true demand is translated into ticket sales.

CENSORSHIP

*Censorship*—or prior restraint—is the halting of a message by the government before the message is uttered. In the United States it has been called the “most serious, least tolerable” infringement of free speech because it halts speech before it can reach the marketplace of ideas (*Nebraska Press Association v. Stuart*, 1976). That is, the speech is not subject to discussion, debate, or rebuttal because it is stifled before such opportunities can be pursued. The word *censorship* has been applied to a wide variety of activities—including newspapers deciding not to publish controversial cartoons, department stores refusing to sell certain magazines, or private organizations firing newsletter editors because of the articles they published. None of these examples constitute censorship, however, because they do not involve government action.

Some governments defend control over expression on the grounds that full debate, particularly of governmental actions, is risky, in that it can undermine the government or be detrimental to national security. Even governments that adhere to doctrines prohibiting prior restraint, however, recognize that not all speech is allowed in all circumstances. Certain kinds of speech, such as that which might harm national security, cause a violent breach of the peace, or tempt a person into illegal conduct, can be restrained by the government. In the United States, recognition of the right to impose censorship in exceptional situations was established in the 1931 case of *Near v. Minnesota*, and has been reaffirmed in subsequent cases. For example, justices on the U.S. Supreme Court have noted that words that are likely to cause “direct, immediate and irreparable” harm to the country may be censored (*New York Times Co. v. United States*, 1971).

Governments that guarantee expressive rights without prior restraint do so generally on the basis that robust, open debate—even when expression is obnoxious or controversial—is the better avenue for decision-making.

Some confusion over the reach of the prior restraint doctrine has emerged because of governmental control over broadcasting, particularly in the United States and Canada. Broadcasting is regulated by the Federal Communications Commission in the United States, and by the Canadian Radio-Television and Telecommunications Commission in Canada. Neither agency has direct control over the content of broadcasting, but each
provides a mechanism through which broadcasters make their messages available to listeners and viewers through a system of licensing. Such governmental regulation in both the United States and Canada has come to be known as the trusteeship model. The model is based on the rationale that the airwaves constitute a natural resource and, as such, belong to the citizenry. Because broadcasting’s electronic spectrum is limited, there must be, therefore, some mechanism for picking and choosing among potential broadcasters. Broadcasters, then, are acting as trustees for the public in their use of the airwaves. Both Canada’s Broadcasting Act of 1991 and the United States’ Telecommunications Act of 1996, which amended the Communications Act of 1934, stipulate that individual broadcasters maintain control over the content of their broadcasts, but also prohibit certain kinds of communication, such as indecent or obscene speech.

CENSUS
A census is a periodic, systematic enumeration of a population. Census-taking activities that counted at least certain segments of the population, such as those expected to be available for military service or to pay taxes, have been documented from ancient times. Modern censuses, broader in scope and content, are taken in many countries and gather statistical data that are used for myriad purposes.

Population counts were made in ancient Babylonia, Egypt, China, and India, some before 2000 or even 3000 BCE. Enumerations occurred in ancient Greece, and a comprehensive census was taken by the ancient Romans. Accounts of enumeration activities, largely to determine numbers of men available for military purposes, are included in the Old Testament. In the New Testament, the Roman census is central to the nativity story; it is said to be occurring at the time of the birth of Jesus Christ, necessitating that people travel to be properly counted and taxed.

During the Middle Ages, censuses occurred periodically, including those in Japan, France, and Italy. The Domesday Book, compiled during the eleventh century for economic purposes under King William I (c. 1028–1087), provided a detailed “description of England.” Later enumerations occurred after the plague swept through the population. During the eighteenth and nineteenth centuries, census efforts were undertaken in various countries around the globe. The first census in North America was conducted in 1666 in New France (Canada). Censuses were taken in Virginia and in most of the British territories before the Revolutionary War (1775–1783). Censuses are now routine in nations worldwide.

The U.S. decennial census, first taken in 1790, is the longest-running periodic census. It is required by Article 1, Section 2 of the Constitution for the primary purpose of reapportionment of the U.S. House of Representatives (i.e., determining the number of seats to which each state is entitled). Census data are also used in redistricting, the redrawing of political districts after reapportionment. More than five hundred other uses of census data have been mandated by federal laws.

Modern census data have numerous government, demographic, social, and economic uses. These uses include marketing research, strategic and capital planning, community advocacy, funding and resource allocation, and disaster relief. Census data are also widely used in academic, government, and genealogical research. Australian census data were even used to connect cases of maternal rubella (German measles) during pregnancy with deafness in children.

Census use, language, and content, however, have controversial implications. Censuses routinely track and quantify diversity by examining social demographics such as race and ethnicity, age, sex, class, disabilities, living arrangements, and family composition. Census “head of household” designations have been challenged as reflecting and perpetuating patriarchal patterns of power and authority implied in such terminology. Racial and ethnicity categorizations have proven contentious and continue to evolve, as do social constructions of those concepts. The analysis of same-sex couples has received increasing attention as well. When the 2001 census in England and Wales added a question on religion, 390,000 respondents recorded “Jedi” (the belief system featured in the popular Star Wars science fiction movies) as their religious preference, having been urged to do so by an Internet campaign. The campaign apparently had the unintended positive effect of encouraging people in their late teens and early
twenties to complete their census forms. No census manages to count every member of the population. Certain
categories of people, such as immigrants and the homeless, are the most likely to be missed and, therefore, under-
counted and potentially underserved.

Some censuses, such as colonial censuses in Africa, have also raised concerns regarding motive, and some censuses have even involved human rights abuses of vulnerable subpopulations, such as the forced migrations of Native Americans in the nineteenth century. These abuses have been particularly evident during times of war. After the 1941 attack on Pearl Harbor, U.S. census data was used by the War Department (now the Department of Defense) in the identification and relocation of Japanese Americans to detention camps. Census data from Germany and occupied regions was central to furthering Nazi interests before and during World War II (1939–1945). It was used in propaganda, in the identification of Aryans and non-Aryans, in the extermination of Jews and others, and in advancing the regime's military goals.

The United Nations Statistics Division, through the World Population and Housing Census Program, has been active in supporting national census-taking worldwide, including the development of census methodology, the provision of technical assistance in conducting censuses, and the dissemination of census data. As census technology, techniques, procedures, research, and guidance become increasingly refined, awareness of various issues is heightened and they can be better addressed.

CENTRAL BANKS

Central banks came into being in Europe in the late seventeenth century (Sweden in 1668, England in 1694) as government sponsored banks that were either state-owned (Swedish Riksbank) or privately owned (Bank of England). Their initial functions were basic in nature: giving financial support to the state in return for legislative advantages and monopoly power in the banking business. Central banks were also established to help centralize and standardize payments systems in countries such as Italy, Germany, and Switzerland, and, in Austria in 1816, to restore the value of the currency after government over-spending during the Napoleonic wars. Regardless of the
initial functions assigned to central banks, they slowly evolved into bankers’ banks—in addition to being the government’s bank—by becoming the main reserves depository institutions for the banking system.

Theories on central banking did not emerge until the late nineteenth century, when it was recognized that discretionary monetary policy had macroeconomic consequences for domestic economic activity as well as international trade balances, especially with regard to exchange rate policies under the gold standard, which was a commodity-money system since the currency was backed by gold reserves at the central bank (and the Bretton Woods system in the twentieth century, under which the U.S. dollar replaced gold as the international reserve currency). One of the early analysts of central banking, Walter Bagehot (1826–1877), founder of The Economist magazine, argued in his famous Lombard Street (1873) that central bankers are incapable of thinking theoretically about the daily transactions they engage in.

**THEORY**

Central banks play a crucial role in macroeconomic policy by acting as a lender of last resort to the banking system and by regulating and supervising the financial system. Policy priorities and the emphases of policies, however, differ depending on the theoretical framework from which central bank economists draw their policy inspiration.

**Mainstream Approach** The mainstream (neoclassical) approach argues that central banks should focus on price stability through money-supply targeting or inflation targeting. According to the logic of this argument, money is neutral in the long run; therefore any increase in the quantity of money would only lead to inflation in the long run. The mainstream approach recommends that the central bank be completely independent from the fiscal authority to prevent monetary expansions by irresponsible governments. Instead, the central bank is commissioned to expand the money supply steadily at a pre-announced rate (a monetary rule). This approach relies on the assumption that the central bank can actually control the quantity of money (verticalist or exogenous money approach) through the three traditional monetary tools: required reserve ratio, discount rate, and open market operations. Hence the central bank can increase the quantity of money by decreasing the required reserve ratio, decreasing the discount rate, or buying bonds; and it can decrease the money supply by doing the opposite. The neoclassical view holds therefore that the quantity of money is exogenously determined by the central bank, whereas the interest rate is an endogenous variable determined by the interaction between money supply and money demand. This neoclassical model came under attack during the Great Depression by Cambridge University economist John Maynard Keynes, and later by the followers of the Keynesian revolution.

**Post-Keynesian Approach** The Post Keynesian approach, by contrast, argues that the money supply is an endogenous process over which the central bank has no control. The quantity of money is driven by the demand for credit by the private sector. The demand for credit is systematically accommodated by profit-seeking banks regardless of the required reserves available to them (horizontalist approach). In a fractional reserve banking system, financial innovation is the key to a successful banking operation. Banks usually extend credit to creditworthy customers, then worry about meeting their reserve requirements. Reserve requirements can be met by borrowing from domestic or foreign banks, by selling financial assets, signing repurchasing agreements with other financial institutions, shifting checking account balances to low-reserve requirement savings accounts, and, as a last resort, borrowing from the central bank (the lender of last resort). Post-Keynesian economists argue that the central bank has no control over an expanding economy, as it is the demand side that is pulling reserves from the central bank, with the latter being compelled to accommodate the market or else risk a financial crisis. For instance, a rapidly expanding economy requires a credit expansion by the entire banking system; the latter will face an inevitable shortage of reserves, thus driving up short-term interest rates above the central bank’s target rate. The central bank must therefore intervene by providing liquidity to the market to prevent financial instability due to rising interest rates. The Post-Keynesian approach holds that the central bank’s policy target cannot be the quantity of money, but rather the short-term interest rate that serves as a benchmark for the entire economy. Hence the interest rate is set exogenously while the quantity of money is an endogenous phenomenon.

Major financial crises have been prevented through central bank intervention as a lender of last resort, as for example after the September 11, 2001, attacks in the United States. In anticipation of a panic after the reopening of financial markets, the Federal Reserve Bank in an emergency meeting lowered its short-term interest rate target by fifty basis points; but most important, it snapped up all government securities offered by dealers, thus pumping up a record sum of $70.2 billion on September 13, 2001. As Paul Davidson notes in his 2002 book, the liquidity injection served not only to prevent a bond-market crash but also to reinstate positive expectations about the stability of the financial system.
Central bank leaders also play a crucial role in the formation of market expectations. Financial investors pay close attention to statements made by central bank officials because they know that central bankers have access to more accurate economic information and unpublished economic indicators, in addition to being in charge of key interest rates that act as benchmarks for the rest of the economy. If, for instance, investors detect a signal from the central bankers suggesting that the central bank is worried about inflation acceleration, and that the central bank is about to raise interest rates, then one would expect bond prices to go up, thus encouraging bond investors to buy more bonds and sell them at a later date; the reverse would ensue if investors were led to believe that the central bank was about to lower interest rates.

CENTRAL BANK INDEPENDENCE

The advocates of central bank independence argue that politicians cannot be trusted to make the tough political decisions as they tend to give in to political pressures, thus only an independent central bank can take action without fear of political retaliation. An independent central bank is expected to slow down the economy by raising interest rates when the unemployment rate drops low. This neo-classical argument rests on the idea that there is a trade off between unemployment and inflation, and that low unemployment rates will inevitably lead to accelerating inflation.

In addition to improved credibility and transparency, central bank independence favors the implementation of monetary rules. This is based on the New Classical view that money is neutral and that monetary policy is ineffective. The Lucas policy ineffectiveness argument states that any anticipated monetary policy will not affect output (thus will not affect employment). The policy ineffectiveness argument does not hold in the case of long-term labor contracts because policymakers in this case can change their behavior (for instance, the central bank can cheat on the announced rate of growth of the money supply). Thus a systematic monetary policy can have real effects. Finn Kydland and Edward Prescott (1977) argue that private agents are rational and thus expect the central bank to reoptimize its (previously announced) policy in the future. In game theory terms, this can be illustrated in a noncooperative Stackelberg game in which the central bank is the leader (it has private information and could change its policy at almost any time) and the private agents are the followers. This will lead the economy to a time-consistent suboptimal (Nash) equilibrium in which the social welfare function is not optimal, even though both the leader and the followers have tried their best to maximize their own respective utilities. It is noteworthy that the concept of the monetary authorities' credibility is of critical importance to the dynamic game described above, if the central bank wishes to implement a monetary rule rather than discretionary monetary policy because of the repeated aspect of the game.

Between 1970 and 1982 New Classical economists demonstrated that anticipated monetary policy is ineffective because economic agents are rational. During that period they produced a substantial literature explaining business cycle fluctuations in terms of the rational expectations hypothesis and supply-side (mainly technological) shocks. The rational expectations hypothesis states that economic agents' subjective expectations concerning economic variables will coincide with the true or objective mathematical conditional expectations of those variables. This assumption should not, however, be considered as synonymous with perfect foresight. Rational expectations in the forward-looking approach (as opposed to the backward-looking approach of the adaptive expectations) imply that economic agents will use the publicly available information and will not systematically form wrong expectations. William Nordhaus used this approach to show that “a perfect democracy with retrospective evaluation of parties will make decisions against future generations” (1975, p. 187). Politicians can use an expansionist monetary policy during an electoral period in order to reduce unemployment and thereby collect more votes. Once reelected, the government can start fighting against the inflation caused by money expansion and therefore push unemployment probably above its initial level. Governments succeed in making use of this political business cycle because the public has a short memory and will not recognize the use of this policy during the next election. The political business cycle theory represents a major argument for central bank independence, meaning that an independent central bank is more likely to implement a noninflationary monetary policy that is consistent with the stability of the general level of prices. The empirical evidence, however, does not show any significant correlation between central bank independence and inflation. In fact, one of the key variables used to measure the central bank independence index is inflation. This approach tends to reduce inflation to expansionary monetary policy and does not take into account other factors such as price-setting power and external shocks in international commodity markets.

DEVELOPING COUNTRIES

Central banks in developing countries face considerable challenges. The conventional wisdom argues that developing countries must maintain a steady inflow of financial capital to finance their savings gap and to fuel the process of economic development. To ensure such conditions, the central bank has to keep inflation low and stable and the
exchange rate pegged to a basket of hard currencies, and in some cases to a single hard currency such as the U.S. dollar or the euro. Such strategies entail keeping interest rates high and the value of the currency artificially overvalued—thus the need to accumulate hard currency reserves to defend the value of the currency. Most developing countries, however, run trade deficits that must be financed through borrowing in hard currencies, which accounts for most developing countries’ recurring external debt problem. In order to prevent financial crisis, the central bank is then obliged to cater to the needs of financial markets by keeping interest rates artificially high, which helps create an inadequate climate for domestic investment. This neoliberal view has dominated central banking in developing countries since the 1980s. The primacy of the low-inflation goal over other macroeconomic goals has crippled many economies in the developing world. As Gerald Epstein (2005) argues, this approach stands in sharp contrast to what central banks have historically done in both developed and developing countries, namely financing government spending, promoting full employment, managing exchange rates, enforcing capital controls, and allocating credit to sectors of special social need such as health care, education, and housing.

WHAT CENTRAL BANKS CAN ACHIEVE

Post Keynesians argue that the central bank can help coordinate the achievement of full employment in both developed and developing countries. Because the government is the monopoly-issuer of its sovereign currency, it follows that there can be no financial constraint on government spending. Money is injected into the system through government spending, and is withdrawn from it through taxation or bond sales. Bonds are not issued to “finance” government deficits, but rather to give the private sector an interest-bearing alternative to cash. The government accepts its own money in payment of tax liabilities, hence creating a demand for the sovereign currency. The value of money then depends on the government’s (and the central bank’s) capability to manage the quantity of money and the level of interest rates in the economy. From this perspective, the government can finance a full employment program by offering to hire anyone at a fixed, socially established living wage to perform socially desirable tasks that the private sector would not otherwise perform. The role of the central bank becomes crucial in financing the program, managing the national debt, and adopting a flexible exchange rate regime. As L. Randall Wray (1998) observes, the central bank independence mantra becomes meaningless if one accepts the necessity of policy coordination between the treasury and the central bank in order to accommodate the economy.

CENTRAL INTELLIGENCE AGENCY, U.S.

As a U.S. senator (D-MO), Harry S. Truman was well aware of the significant loss in lives and matériel that resulted from America’s inadequate intelligence prior to the Japanese attack on Pearl Harbor in 1941. During his
three-month tenure as vice president and, upon becoming president when Franklin D. Roosevelt died in April 1945, Truman experienced further dissatisfaction with the lack of coordination among U.S. intelligence units throughout the remaining months of World War II. After the war, the avoidance of a future Pearl Harbor—that is, achieving reliable warning, the premier objective of intelligence—became a high priority for the Truman administration as it pursued the establishment of a modern intelligence system. Lawmakers on Capitol Hill also evoked the memory of Pearl Harbor as they debated how to prevent surprise attacks against the United States.

The Truman administration soon faced another reason for making improvements in U.S. intelligence: a sense in 1946 that the Soviet Union had emerged on the world stage as a formidable and hostile adversary. War-weary American soldiers had barely returned home from Europe and Asia when Soviet-phobia began to grip Washington, D.C., stirred by Winston Churchill’s “Iron Curtain” speech in 1946 and waves of vitriolic anti-West propaganda emanating from Moscow. As intelligence scholar Rhodri Jeffreys-Jones stated in Eternal Vigilance (1997), “past weaknesses” like Pearl Harbor served as part of the backdrop for the debate about reforming U.S. intelligence in 1946–1947, but more important were “present imperatives” (p. 23)—above all, the rise of Soviet power in the world. Just as the United States could have benefited greatly from having better indications and warning (IKW, in the intelligence acronym) about the movements of Japanese warships in 1941, so five years later did leaders in Washington seek reliable intelligence on the military capabilities and intentions of the Union of Soviet Socialist Republics (USSR).

THE CENTRAL INTELLIGENCE GROUP
One of Truman’s top aides, Clark Clifford, recalled in his memoir Counsel to the President (1991): “By early 1946, President Truman was becoming increasingly annoyed by the flood of conflicting and uncoordinated intelligence reports flowing haphazardly across his desk” (p. 166). On January 22, 1946, he signed an executive order that created a Director of Central Intelligence (DCI) and a Central Intelligence Group (CIG), with the express purpose of achieving a “correlation and evaluation of intelligence relating to the national security.” The order allowed the CIG to “centralize” research and analysis and “coordinate all foreign intelligence activities.” Truman’s original intent was, as he told biographer Merle Miller in the book Plain Speaking (1973), to avoid “having to look through a bunch of papers two feet high” and instead receive information that was “coordinated so that the President could arrive at the facts” (p. 420). In twenty-first-century terminology, he longed for the “all-source fusion” of intelligence or, in a military term, intelligence jointness.

Yet the president never saw his hope fulfilled. From the beginning the CIG proved weak. One of its primary tasks was to put together the Daily Summary, the predecessor to today’s President’s Daily Brief. Yet, intelligence units in the various departments balked at handing over information to the CIG. Secretary of State James F. Byrnes, for example, refused to pass along cables from his staff overseas, maintaining that he would tell the president directly what he needed to know. In response to this intransigence, Truman weighed in on behalf of the CIG and ordered Byrnes to cooperate in the preparation of the Daily Summary. Nevertheless, departments remained resentful and often resistant to the concept of intelligence sharing. White House support for the CIG notwithstanding, putting together the Daily Summary quickly became an exercise in futility.

The administration turned toward the idea of creating a stronger organization: a Central Intelligence Agency, or CIA. It soon became clear to President Truman, however, that the acquisition of a truly centralized intelligence system would come at too steep a price, in light of an even more urgent goal the White House sought to achieve: military consolidation. World War II had been rife with conflict between the services, often interrupting the pursuit of battlefield objectives. President aide Clark Clifford reflected in his memoir on how the administration had to play down intelligence reform in favor of settling the “first order of business—the war between the Army and the Navy.” The “first priority,” he continued, “was still to get the squabbling military services together behind a unification bill.”

The creation of a Department of Defense, replacing the old Department of War, would provide a means for drawing the services closer together. The president did not wish to complicate the fight for unification by seeking, at the same time, intelligence consolidation that was bound to roil the military services as a threat to their own confessional and parochial approaches to intelligence. The one point that all the military services, as well as the Department of State and the Federal Bureau of Investigation (FBI), agreed on was that they did not want a strong central agency controlling their intelligence collection programs.

As a result, the Truman administration retreated from its goal of intelligence consolidation. The diluted language of the National Security Act of 1947 provided for only a weak DCI and a CIA that was little different from the failed CIG. As Clifford conceded, the effort fell “far short of our original intent” (p. 169). The landmark National Security Act of 1947 would mainly address the issue of military unification; intelligence was only a secondary
consideration. The statute created a Central Intelligence Agency, but left the details vague on just how the new independent agency was supposed to carry out its charge to “correlate,” “evaluate,” and “disseminate” information to policymakers in light of the powerful grasp that the policy departments (like Defense and State) retained over their individual intelligence units. The law represented a delicate attempt to create a CIA that, as historian Michael Warner wrote in his study *Central Intelligence* (2001), would have to “steer between the two poles of centralization and departmental autonomy.” As a result, the CIA “never quite became the integrator of U.S. intelligence that its Presidential and congressional parents had envisioned” (pp. 45, 47).

The rhetoric of “intelligence coordination” expressed in the law sounded good; but the reality of bringing coordination about was a different matter altogether. Genuine integration of America’s intelligence agencies required a strong DCI, leading a truly central intelligence agency with budget and appointment powers over all the other secret agencies. In 1952 this cluster of secret agencies became known by the misnomer “the intelligence community.” In reality, they remained separated organizations (“stovepiped,” in intelligence slang) with their own powerful program directors (“gorillas”) and allegiance to their own department secretaries. The DCI’s authority as spelled out in the National Security Act of 1947 was feeble, leaving the nation’s spymaster in a position of having to cajole, persuade, plead, even beg for coordination, rather than order it through the threat of budget and personnel retaliation against those “gorillas in the stovepipes” who failed to comply with the DCI’s directives.

While the DCI more or less controlled the CIA and had a main office there, the other fourteen agencies (sixteen in the mid-2000s) enjoyed considerable autonomy. The Director was unable even to determine how the nation’s intelligence budget of some $44 billion would be spent each year. In addition to the CIA, the other agencies include the National Security Agency (NSA); the National Geospatial-Intelligence Agency (NGA); the National Reconnaissance Organization (NRO); the Defense Intelligence Agency (DIA); the State Department’s Intelligence and Research (INR); intelligence units in the Departments of Energy, Homeland Security, and Treasury; FBI intelligence; the Drug Enforcement Administration; the Coast Guard; and intelligence units within each of the military services (army, navy, air force, marines). Even twenty years after the creation of the CIA, one of its deputy directors, Adm. Rufus Taylor (who served from 1966 to 1969), referred to the various intelligence agencies as little more than a tribal federation.

An important part of the CIA’s history since the Truman administration has been a series of efforts to overcome the flaw in its original design—that is, to strengthen the DCI and the CIA in their roles as collator and disseminator of information from throughout the broad intelligence community. The steam went out of each of these efforts after they confronted resistance from the various agency “gorillas” (the chiefs of each of the agencies) and the department secretaries, especially the secretary of defense in alliance with the congressional Armed Services Committees. “For the duration of the Cold War, the White House kept nudging successive Directors of Central Intelligence to do more to lead the Intelligence Community,” Warner concluded. But a towering obstacle persisted: “Cabinet-level officials . . . saw no reason to cede power to a DCI” (p. 49).

**THE PURPOSE OF THE CIA**

The precursor to the CIA during World War II was the Office of Strategic Services (OSS). During that war, the OSS provided covert assistance to resistance movements in Europe and Asia, and became adept at providing research relevant to the war effort and on occasion carried out derring-do secret operations behind enemy lines. Its most long-lasting effect, though, was to serve as a training ground for individuals who would help create and lead the CIA once it was created in 1947. The OSS was disbanded after the war, but many of its experienced personnel soon entered the new CIA, including future directors Allen Dulles, Richard Helms, and William Colby.

The CIA, an independent organization situated neither within the organizational framework of the Pentagon nor in any of the other cabinet departments, continued the kind of operations employed by the OSS during World War II—only now with a much more prominent position in the government and a new adversary: the communist nations of the world. “The Agency,” as the CIA is called by its own personnel, has three primary missions: the collection and interpretation (“analysis”) of information gathered from every corner of the globe; the protection of U.S. government secrets against hostile intelligence services and other spies (“counterintelligence”); and the clandestine manipulation of events in foreign lands on behalf of America’s interests, through the use of propaganda, political activities, economic disruption, and paramilitary operations (collectively known as “covert action” or “special activities”).

**Intelligence Collection and Analysis** The collection of intelligence relies on machines (satellites and reconnaissance airplanes, for example; so-called technical intelligence or “techint,” in the professional acronym); on human means (classic espionage or human intelligence;
“humint”); and on the sifting of information available in the open literature (newspapers, public speeches, and the like; sometimes referred to as open-source intelligence or “osint”). Each method has its drawbacks. Photographs taken by satellites can be useful, but Al Qaeda and other contemporary terrorist organizations have become adept at hiding in caves in Southwest Asia, out of sight from the cameras. Moreover, the CIA lacks sufficient spy handlers (“operations officers”) abroad with good foreign language skills to recruit local agents (“assets”), especially in places where the United States has never had much of a presence (such as in China and nations in the Middle East and Southwest Asia). As a result, the human intelligence flowing back to the CIA is insufficient.

Even if this humint problem were solved, the community faces another, equally serious human deficiency: analytic brain power. The CIA does not have enough talented information interpreters (“analysts”) to lend insight to the fire hose of data that streams into its offices each day from overseas. On the eve of the second Persian Gulf War, for instance, the agency had few analysts fluent in Arabic. It is deficient, too, in the number of analysts who understand the history and culture of places like Iran and Pakistan that the United States largely ignored during its concentration on the Communist part of the world during the cold war.

**Counterintelligence** The CIA’s counterintelligence mission received its greatest setback in the period from 1984 to 1996. During that time, a CIA officer by the name of Aldrich H. Ames secretly spied on his own organization for the Soviet Union. He identified for the Soviets over 200 CIA operations against the USSR and revealed the names of nine CIA agents in Moscow, all of whom were then executed by Soviet officials. The CIA’s top counterintelligence challenge is to protect the agency’s computers and other facilities from foreign “moles”—penetration agents engaged in treason against the United States on behalf of terrorist groups or other American adversaries.

**Covert Action** Covert action has been the most controversial of the CIA’s missions. It may be defined as those activities carried out by the agency to secretly influence and manipulate events abroad. This approach is often referred to as the “Third Option”—in between, on the one hand, sending in the marines and, on the other hand, relying on the diplomatic corps to achieve America’s goals. The use of military force is “noisy” and likely to draw a quick reaction from adversaries, as well as stir widespread debate at home; and diplomacy can be notoriously slow and often ineffectual. Thus, covert action has had a special appeal to some policy officials: with this tool, they can move rapidly and in relative quiet, avoiding lengthy public discussions over tactics and broader objectives (hence, the “quiet option” is another euphemism for covert action).

Covert action has often failed, as with the failed Bay of Pigs operation against Cuba in 1961 and the Iran-Contra scandal in 1986. The latter especially discredited covert action, because the Reagan administration carried out CIA paramilitary operations against Nicaragua despite vociferous congressional opposition. After the Iran-Contra episode, the budget for covert action plummeted to its lowest levels: less than 1 percent of the CIA’s annual budget. It would take the terrorist attacks against the United States on September 11, 2001, to stimulate a renewed interest in this approach to foreign policy and funding for covert action began a rapid rise upward in the name of combating world terrorism. In 2001–2002, the use of CIA paramilitary operations against the Taliban regime in Afghanistan, in tandem with overt military operations by the indigenous Northern Alliance and U.S. bombing missions, opened a new chapter in America’s reliance on covert action. Today the most lethal weapon of covert action is the Predator, a pilotless drone armed with Hellfire missiles.

While the CIA’s secret propaganda operations against the Soviet Union and China during the cold war have been praised, the agency’s operations in the developing world have been subjected to widespread criticism. The best known and most controversial example is Chile during the 1960s. In the Chilean presidential election of 1964, the CIA spent $3 million to blacken the reputation of Salvador Allende, the Socialist candidate with suspected ties to Moscow. On a per capita basis, this amount of money was equivalent to the secret expenditure of $60 million in a U.S. presidential election at the time, a staggering level of funding. The CIA managed to thwart Allende’s election in 1964, but he persevered and in 1970 was elected president of Chile in a free and open election.

The CIA then turned to a range of propaganda and other covert actions designed to undermine his regime. The agency poured another $3 million worth of secret propaganda into the country between 1970 and 1973, in the form of press releases, radio commentary, films, pamphlets, posters, leaflets, direct mailings, paper streamers, and vivid wall paintings that conjured images of Communist tanks and firing squads that would supposedly soon become a part of life in Chile. Printing hundreds of thousands of copies, the CIA flooded the country (predominantly Catholic) with an anti-Communist pastoral letter written many years earlier by Pope Pius XI. The effect was to substantially weaken the Allende government.

Another well-known CIA covert action operation occurred in 1953, when the CIA joined British intelligence operatives in the overthrow of Mohammed
Mossadegh in Iran. In his place, the CIA installed a pro-West leader known as the shah of Iran, who provided the United States with loss-cost oil and a friendly government in the heart of the Middle East. The shah, though, lost the support of his people over time and was finally deposed by a revolution in 1979 that brought to power a fundamentalist Islamic regime in Iran.

The Special Case of Assassination Plots A special category within the domain of paramilitary operations is the assassination of foreign leaders. This option has gone by a number of euphemisms: “executive action,” “terminate with extreme prejudice,” and “neutralization.” At one time during the cold war, proposals for assassination were screened by a special unit within the CIA called the “Health Alteration Committee.”

Fidel Castro was America’s prime target for assassination during the Kennedy administration. The agency emptied its medicine cabinet of drugs and poisons in various attempts to kill or debilitate the Cuban leader. Agency assets planned to dust his combat boots with depilatory powder, in hopes the chemical would enter his bloodstream through the soles of his feet and cause his charismatic beard to fall off. When this plot was abandoned (Castro’s boots were not so accessible), other agents sought to inject his cigars with the hallucinogenic drug LSD, as well as with a deadly botulinum toxin. Again, the operations failed. Various other plots using guns failed as well, even though the CIA recruited the Mafia to assist in the assassination attempts inside Cuba. Another target of a CIA assassination plot was Patrice Lumumba of Congo, who was killed by a rival African faction just before the agency tried to poison him.

The most widely reported CIA operation to eliminate large numbers of lower-level officials from the scene arose in the context of the Vietnam War. Code-named the “Phoenix Program,” the intention was to subdue the influence of the Communist Viet Cong (VC) in the South Vietnamese countryside. Some twenty thousand VC officials were killed as a result of this operation, though mostly in the context of military or paramilitary combat with South Vietnamese or U.S. troops.

In 1976 U.S. public revulsion toward the murder plots against foreign heads-of-state led to the signing of an executive order by President Gerald R. Ford prohibiting assassination as an instrument of U.S. foreign policy. The order, which states that “no person, employed by or acting on behalf of the United States Government, shall engage in, or conspire to engage in assassination,” has been endorsed by every president since Ford. The executive order has been interpreted to have a wartime waiver, which allowed presidents to use assassination as an instrument of combat in Iraq and against Al Qaeda. Proponents of covert action argue that the defeat of such venal powers as the Communists during the cold war or terrorists today justifies the use of this method. Those taking a more ethical approach to foreign policy have objected, though, to the “anything goes” approach to a national security.

The Church Committee Inquiry The assassination plots were uncovered in 1975–1976 by the Church Committee in the U.S. Senate, named after its chairman Senator Frank Church (D-ID). This investigative panel formed after reporting in the New York Times in late 1974 indicated that the CIA may have used its secret powers to spy on American citizens, in an operation known as CHAOS. Investigators discovered the Times was correct about the illegal opening of mail sent or received by some 1.5 million American citizens, but this was only part of the story. The Committee discovered as well that the CIA had engaged in drug experiments against unsuspecting subjects, two of whom died from the side effects; had manipulated elections even in democratic regimes like Chile; and had infiltrated religious, media, and academic organizations inside the United States.

In the aftermath of this inquiry, Congress established permanent intelligence oversight committees in the Senate and the House, and passed legislation to provide closer supervision by lawmakers over the secret agencies. The purpose was to establish safeguards to ensure that Congress would be in a position to halt abuses by the CIA and America’s other intelligence organizations. This is not to say that the Church Committee created a foolproof system of intelligence accountability. The Iran-Contra affair of 1986–1987 served as a reminder that even robust legislative safeguards are no guarantee against the misuse of power by determined conspirators in the executive branch. That scandal led to a further tightening of oversight procedures, including the creation of a CIA Office of Inspector General directly answerable to Congress.

The fear in 1975, when the Church Committee revealed the extent of intelligence abuses, was that the CIA and its companion agencies might begin to function as a secret government, subject to little review or restraint. Certainly, the Committee’s findings suggested this had become the case. America had to relearn anew an old lesson well understood by the founding fathers, namely, that power can have a corrupting influence on those who hold it—the central idea that guided the writing of the Constitution in 1789. With the safeguards established by the members of the Church Committee and other key officeholders in 1976, citizens of the United States are far less likely to suffer abuse at the hands of the secret agencies than during the earlier years of benign neglect when the intelligence organizations were relatively free of supervision.
Some have faulted this increased accountability as an impediment to the conduct of swift and flexible intelligence operations necessary to defeat America’s enemies abroad. The debate continues over the proper balance between accountability and efficiency—whether or not to have meaningful checks and balances in the domain of intelligence operations.

**9/11 AND THE NEW INTELLIGENCE DEBATES**

In the aftermath of the 9/11 terrorist attacks and mistakes about the existence of weapons of mass destruction (WMDs) in Iraq, official inquiries into the performance of the intelligence community pointed to the need for a strengthened DCI who could improve the sharing of information among the CIA and the other secret agencies. In July 2004, the 9/11 or Kean Commission (after its chair, Thomas H. Kean, a Republican former governor of New Jersey) advocated, along with a series of other reform proposals, the creation of a director of national intelligence, or DNI, with full budget and appointment powers over the intelligence community. In December 2004, Congress passed an intelligence reform bill, known as the Intelligence Reform and Terrorism Prevention Act, which established the DNI office. The Department of Defense and its allies in Congress managed, however, to dilute and obfuscate the authorities of the new intelligence director. As a result, the DNI—just like the DCI before—has ambiguous authority over budgets and hiring for all sixteen agencies. Not even the shock of the 9/11 and WMD intelligence failures have been enough to bring about the consolidation of the intelligence community.

Even a strong DNI with full authority over intelligence budgets and a mandate to bring about better information-sharing would not solve, in itself, America’s intelligence weaknesses. Reformers agree that other necessary changes included the development of better human intelligence in places like the Middle East and Southwest Asia (so-called humint—old fashioned espionage); improved foreign language skills and knowledge of foreign countries among collectors and analysts; better data-sifting to sort through the flood of data that pours into Washington from collectors around the world, separating the important “signals” from the large mass of “noise”; and fully integrated information technology, both horizontally throughout the federal government and vertically from Washington, D.C., down to state and local counterterrorism officials.

**THE FUTURE OF THE CIA**

The 9/11 attacks and subsequent investigations failed to produce reforms that would have fulfilled President Truman’s hopes for a strong national intelligence chief. On the contrary, in a paradox the post-9/11 reforms have led to a diminution in the powers of the DNI and a decline in the coordinating role originally assigned to the CIA in 1947. The CIA is no longer the central focus in America’s intelligence establishment; it has become just one of the nation’s sixteen secret agencies. Even its authority over humint, once full, is now shared with the Department of Defense. Moreover, unlike the DCI, the DNI is not located at CIA headquarters, but rather in a building at Bolling Air Force Base, near National Airport, cut off from the CIA’s experienced analytic and report-production facilities—indeed without any infrastructure beyond a small support staff. The DNI is in a weak position for trying to resolve the fissile tendencies of the intelligence “community.” The CIA has been weakened, too, by its 9/11 and WMD failures.

During the second Bush administration, the United States found itself involved simultaneously in three wars: in Afghanistan and Iraq, as well as against global terrorism. Yet its intelligence agencies continued to display the same attributes that so troubled President Truman in 1947. They had yet to acquire firm leadership from a strong director of national intelligence, and they continued to be plagued by an inability to work together in a cohesive manner. Even the modest centralization of intelligence provided by the CIA in earlier years was on the wane as the agency found itself no longer at the core of the intelligence establishment.

Central Limit Theorem

The central limit theorem (CLT) is a fundamental result from statistics. It states that the sum of a large number of independent identically distributed (iid) random variables will tend to be distributed according to the normal distribution. A first version of the CLT was proved by the English mathematician Abraham de Moivre (1667–1754). He showed how the normal distribution can be used to approximate the distribution of the number of heads that will result when a coin is tossed a large number of times.

The CLT is the cornerstone of most estimation and inference of statistical models, which in turn are widely used in empirical work in the social sciences. Statistical models involve unknown population parameters that are estimated from a sample. The estimators often take the form of sample averages. According to the CLT, the estimators will therefore be approximately normally distributed for a sufficiently large sample size. This result can be used to draw inference about the population parameters. One example of a statistical model used in social sciences is the linear regression model. Here, the CLT can be used to quantify whether a chosen set of variables explains the variation in a certain response variable.

THEOREM

Let \( \{x_1, \ldots, x_n\} \) be a sample of \( n \) iid random variables with mean \( \mu \) and variance \( \sigma^2 \). Consider the sum \( S_n = x_1 + x_2 + \ldots + x_n \). One may easily check that the mean and standard deviation of \( S_n \) are \( n\mu \) and \( \sqrt{n}\sigma \). Normalize \( S_n \) as follows,

\[
Z_n = \frac{S_n - n\mu}{\sqrt{n}\sigma}
\]

such that \( Z_n \) has mean zero and standard deviation 1. The CLT then states that \( Z_n \sim N(0,1) \) for \( n \) large enough. Formally, the above equation should be read as follows: For any \( -\infty < z < +\infty \), \( P(Z_n \leq z) \to \Phi(z) \) as \( n \to \infty \), where \( \Phi(.) \) is the cumulative density function of the normal distribution.

A major drawback of the CLT is that it is silent about how large \( n \) should be before the quality of the approximation is good. This will depend on the distribution of the \( x_i \)'s making up the sum.

APPLICATIONS

The CLT has a broad range of applications. Consider, for example, a binomial random variable \( S_n \) with parameters \((n,p)\). This variable describes the number of heads in \( n \) tosses of a coin with probability \( 0 < p < 1 \) of heads. Its distribution is given by

\[
P(S_n = j) = \binom{n}{j} p^j (1-p)^{n-j}, \quad j = 0, 1, \ldots, n.
\]

For \( n \) large, this distribution can be difficult to compute. Another way of representing \( S_n \) is as a sum of \( n \) iid Bernoulli random variables \( \{x_1, \ldots, x_n\} \). That is, \( S_n = x_1 + x_2 + \ldots + x_n \), where the distribution of \( x_i \) is \( P(x_i = 1) = 1 - P(x_i = 0) = p \), \( i = 1, \ldots, n \). So we can apply the CLT on \( S_n \), which tells us that \( S_n / \sqrt{n} \sim N(np, np(1-p)) \) for \( n \) large enough since \( \mu = E[x] = p \) and \( \sigma^2 = Var(x) = p(1-p) \). This result was first proved by de Moivre in 1733.

The most important use of the CLT is probably in drawing inference about population parameters in statistical models. Most estimators of parameters can be written as sums of the sample, and so the CLT can be used to obtain a measure of the precision of the estimator. In particular, it can be used to test hypotheses regarding the parameters. As a simple example, consider an iid sample \( \{x_1, \ldots, x_n\} \) with unknown population mean \( \mu \) and variance \( \sigma^2 \). A simple estimator of the parameter \( \mu \) is the sample average,

\[
\bar{x} = \frac{x_1 + \ldots + x_n}{n} = \frac{1}{n} S_n.
\]

We can now use the CLT to conclude that

\[
\frac{\bar{x} - \mu}{\sigma/\sqrt{n}} = \frac{S_n - n\mu}{\sqrt{n}\sigma} \sim N(0,1)
\]

Since the variance is unknown, it needs to be estimated. This can be done using the sample variance,

\[
\hat{\sigma} = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \bar{x})^2.
\]

One can now use the normal approximation for inferential purposes. For example, we can estimate the standard error of \( \bar{x} \) as \( \hat{\sigma} / \sqrt{n} \). Also, we know that \( \bar{x} - 1.96\hat{\sigma} / \sqrt{n} \leq \mu \leq \bar{x} + 1.96\hat{\sigma} / \sqrt{n} \) with approximately 95 percent probability, where 1.96 is the 97.5th percentile of the normal distribution; one normally refers to this as the confidence interval. The CLT can furthermore be used to test specific hypotheses regarding \( \mu \).
Central Tendencies, Measures of

The mean, the median, and the mode are measures of central tendency, used singly or jointly, to summarize information about a variable. Percentage frequency distributions and graphs may also be used, but measures of central tendency are more concise and provide a single “typical” or “average” score for the variable under consideration. They are easy to calculate and are readily understood by the public. Each of the three measures of central tendency has assets and liabilities. The combined use of all three measures provides information about the degree of symmetry in the distribution of the variable because in a normal (i.e., Gaussian) distribution, the mean, median, and mode will all be the same.

The mean is generally assumed to be the arithmetic mean or the average; it is calculated by summing the individual scores of the variable and dividing these by the total number of scores. The formula for the population mean is

$$\mu = \frac{\sum X_i}{N},$$

where \( \mu \) is the population mean, \( X_i \) is the score on the variable for the \( i \)th subject, and \( N \) is the total number of subjects. The formula for the sample mean is

$$\bar{X} = \frac{\sum X_i}{N},$$

where \( \bar{X} \), sometimes referred to as X-bar, is the sample mean.

Although the problem of examining a set of observations and estimating an overall value was entertained as early as three centuries BCE by Babylonian astronomers (Plackett 1958), the arithmetic mean as a statistical concept did not appear until many centuries later. The term is first found in the mid-1690s in the writings of Edmund Halley (1656–1742), and it has been used to summarize observations of a variable since the time of Galileo (1564–1642). Carl Friedrich Gauss (1777–1855) may have been the first to show that lacking any other information about a variable’s value for any one subject, the arithmetic mean represents the most probable value (Gauss [1809] 2004, p. 244).

The mean is an efficient description of the distribution of a variable’s scores. For example, educators and students use the mean or grade point average (GPA) to describe academic achievement. Its primary limitation is that it works best when the variable it is describing is distributed normally. If there are outliers in the distribution—for example, one score or several scores lying outside the normal range—the mean will be skewed and may thus be misleading. The mean is heavily influenced by outlying values, and is thus not as robust as the median (see below). Second, the mean requires interval/ratio data, whereas the median can be used with both interval/ratio and ordinal data, and the mode can be used with nominal data.

The median, sometimes abbreviated Md or Mdn, is the halfway point or the midpoint score in a distribution of scores. Half of the scores are greater, and half the scores are less, than the median. The median is the score that divides the distribution exactly in half. If there is an odd number of scores, the median is the middle number; if there is an even number of scores, the median is the average of the two middle scores. The median is less likely to be influenced by extreme outliers, and is usually the preferred measure of central tendency for skewed data, such as income. The median has no special notation and is obtained in the same way for both a population and a sample.

The median gives a better description than the mean of a skewed variable. For example, if one is comparing the income in an area where there is only one person who is a billionaire and the bulk of the population lives in poverty, the median will more accurately reflect the central income of the population. The median can also be used when there are undetermined or infinite scores, making it impossible to determine a mean. The median also has limitations. It works best with small samples, or with large samples that are normally distributed. It is less efficient and more subject to sampling fluctuations than the mean. An early use in English of the statistical concept of median was Francis Galton’s (1822–1911) observation that “the median … is the value which is exceeded by one-half of an infinitely large group, and which the other half falls short of” (1881, p. 245).

The mode is the score that occurs most frequently in a distribution. It has no special notation and is obtained in the same way for both a population and a sample. The mode has several advantages over the other measures of central tendency. First, it may be used with nominal data. Second, one can use the mode as a single number with discrete variables. Third, the mode is simple to calculate and present visually. Fourth, it provides a shape of the distribution as well as a measure of central tendency. Unlike the mean and the median, a distribution can have more

Centers Kristensen
than one mode. A single score that occurs most frequently is the modal score. If there are two scores that occur the most frequently, the distribution is referred to as bimodal. If there are multiple scores that occur at the same high frequency, then the distribution is labeled multimodal. The mode also has limitations, one of which is that it is inefficient in its use of data in that much of the data are not used. Although modal descriptions are easily understood, the mode is rarely used in research except as additional information or when included in the narrative. An early use of the statistical concept of the mode was by English mathematician Karl Pearson (1857–1936) in 1895 when he stated that "I have found it convenient to use the term mode for the abscissa corresponding to the ordinate of maximum frequency" (1895, p. 345).

Two limitations of all three measures of central tendency are that although they are commonly used as descriptive statistics, they do not provide sufficient statistical analysis to describe variation in a population or to elaborate the differences between cases or people. Therefore, they usually do not function in a stand-alone manner as a sole statistical description. Fortunately, the mean also functions as a basis for other statistical analyses that fill the gap, since what is most important in social research is not only the average but also the variation within the population. The mean is used in many statistical formulae. It is used as a basis for statistical analysis of variation, including the standard deviation (i.e., deviation from the mean), the coefficient of determination or $R^2$, covariance, analysis of variance, and regression. The mean is also used frequently in meta-analyses.

CENTRISM

In politics, centrism refers to the tendency to avoid political extremes by taking an ideologically intermediate position. A centrist promotes moderate policies by finding a middle ground between the left and the right and downplays ideological appeals in favor of a pragmatic or “catch-all” party platform. Centrism can be seen as a means to maximize electoral support, especially among swing voters (those who will vote across party lines).

The left-right political spectrum is a traditional way of classifying ideologies, political positions, or political parties. The terms left, right, and center are believed to originate from the manner in which parliamentary factions were seated in the French Convention after the Revolution of 1789. Seated on the left were radicals such as the Montagnards and the Jacobins, who wanted to abolish the monarchy, the aristocracy, and even religion in France. Seated on the right were royalists and conservatives such as the Feuillants, who supported the king and the Catholic Church. Seated in the center were moderate republicans like the Girondins, who wanted to abolish the Bourbon monarchy but opposed radical demands for revolutionary terror and exporting the revolution to the rest of Europe.

In contrast to the center, both the left and the right are understood to represent well-defined political positions, or ideologies, that are polar opposites of each other. The left-right spectrum is linked to the rise of three main ideologies—conservatism, liberalism, and socialism. Conservatism is associated today with a right-wing stance; conservative ideology resists progressive social change and tries to conserve the status quo, or bring back the status quo ante of the ancien regime. Those to the right of conservatives are sometimes called ultraconservatives or the Far Right; these labels may refer to fascists, national socialists (Nazis), ultranationalists, religious extremists, and other reactionaries. Next to emerge was liberalism, which situates itself in the center of the political arena, claiming to be moderate, reformist, and thus centrist. The last of the three ideologies to arise, socialism is commonly seen as left-wing or radical, because socialists view themselves as the radical or militant heirs of the French Revolution. Unlike self-styled centrist liberals, socialists believe that social progress cannot always be achieved by gradualist liberal reforms alone and may require radical social change or even social revolution. Those to the left of socialists are typically labeled ultraleftists or the Far Left, often referring to anarchists, Communists, Trotskyists, Maoists, and other extreme leftists.

Center-leaning politicians or parties usually seek compromise between conflicting political extremes and often take middle-of-the-road stances designed to bridge opposite ideological camps. Political centrism is thus by
definition a relational concept, because the positions considered centrist depend on the specific policies of the competing ideological poles that the moderates are trying to reconcile. Centrism is important in the early twenty-first century because it is believed to apply to a very large section of the politically active population. In many countries, most members of the voting public tend to identify themselves as independent rather than as either left-wing or right-wing. The Economist stated in April 2005, “Most Americans have fairly centrist views on everything from multiculturalism to abortion. They like to think of themselves as ‘moderate’ and ‘non-judgmental.’ More people identify themselves as independents (39%, according to the Pew Research Centre for the People & the Press) than as Democrats (31%) or Republicans (30%).”

Politicians of various parties thus try to appeal to this presumed majority in the center to reach beyond their traditional, narrow constituencies and win elections. Left-wing and right-wing parties dilute their more extreme positions, for both know that the bulk of voters are somewhere near the center. With ideological considerations toned down, centrism tends to make politics more tranquil and stable. The post–cold war decline of left-right divisions has fastened the spread of a new centrist ideology, which is more supportive of democracy and capitalism.

But this center-seeking or centripetal approach entails some risk. Candidates advocating centrist policies to gain wider voter appeal risk demobilizing potential voters and losing support from the more ideologically minded partisans of their own party. Calling itself “New Labour,” the revamped British Labour Party won three successive general elections, but voter turnout declined from 71.29 percent in 1997 to 61.36 percent in 2005, as successive general elections, but voter turnout declined from 71.29 percent in 1997 to 61.36 percent in 2005, as Prime Minister Tony Blair’s policy of abandoning key socialist tenets and embracing the center ground alienated many Labour loyalists.

CHAMBERLAIN, NEVILLE

1869–1940

Although Arthur Neville Chamberlain entered Parliament in 1918 at the age of almost fifty, the election of a Conservative government in 1922 paved the way for his meteoric rise from postmaster-general, via the Ministry of Health to the Treasury and the second place in Stanley Baldwin’s government within only ten months. Thereafter, a dynamic period of social reform between 1924 and 1929 and his leading role during the Conservative Party and financial crises of 1930–1931 ensured that he emerged swiftly as Baldwin’s heir-apparent; claims powerfully reinforced by his success as chancellor of the exchequer between 1931 and 1937 when he presided over Britain’s spectacular recovery from the Great Depression. Although there is much debate about the reasons for Britain’s rapid return to prosperity, Chamberlain attributed it to a combination of a general tariff (introduced March 1932) and a “cheap money” policy designed to stimulate economic activity through low interest rates. Equally central to Chamberlain’s strategy was an ostensibly rigid commitment to balanced budgets. Although condemned by critics as proof of an unimaginative passivity in face of mass unemployment, Chamberlain staunchly defended the policy as crucial to the maintenance of investor confidence that there would be no departure from “sound finance” into the hazardous realms of loan-financed public works.

From 1934 onward, Chamberlain was deeply preoccupied with the problems of defending a vast and vulnerable global empire from the cumulative threats posed by Japan, Italy, and Germany at a time when Britain could not afford to rearm sufficiently ever to contemplate the possibility of fighting three major powers in widely separated areas. After his succession to the premiership in May 1937, Chamberlain’s response to this conundrum was to pursue with far greater vigor and determination his so-called double policy of rearmament and appeasement. The former was intended to repair defensive deficiencies at a pace the country could afford without jeopardizing long-term economic stability: Britain’s so-called fourth arm of defense. The latter policy simultaneously attempted to achieve better diplomatic relations with the dictators by redressing their legitimate grievances, and in so doing either to remove the underlying causes of tension or to expose Germany’s Adolf Hitler as an insatiable mentally unstable leader bent on world domination. Chamberlain thus described his strategy as one of hoping for the best while preparing for the worst.

In September 1938 this policy culminated in the Munich conference at which the largely German-speaking
Sudeten area of Czechoslovakia was ignominiously ceded to Hitler. Although Chamberlain’s success in averting an imminent and probably unwinnable war was initially hailed as a great personal triumph, his ill-judged promise of “peace for our time” soon came back to haunt him when Hitler seized the remaining (non-German) part of Czechoslovakia in March 1939 and then invaded Poland six months later. Despite continuing as prime minister throughout the so-called Phoney War, increasing discontent with Chamberlain’s leadership erupted in a parliamentary debate on May 7–8, 1940, when a substantial revolt of Members of Parliament inflicted a crushing moral (but not technical) defeat upon Chamberlain. He resigned as prime minister two days later but remained a key member of Winston Churchill’s all-party coalition until shortly before his death from cancer on November 9, 1940.

CHANGE, TECHNOLOGICAL

Technological change refers to the process by which new products and processes are generated. When new technologies involve a new way of making existing products, the technological change is called process innovation. When they include entirely new products, the change is referred to as product innovation. The invention of assembly-line automobile production by the Ford Motor Company is a widely cited example of the former, while automated teller machines (ATMs) and facsimile machines can be seen as product innovations.

Broadly speaking, technological change spurs economic growth and general well-being by enabling better utilization of existing resources and by bringing about new and better products. Besides benefits to suppliers or inventors of new technologies via disproportionate profits, new technologies have benefits for consumers (e.g., innovations in health care) and for the society (e.g., better oil-drilling techniques enabling less wastage and a more effective utilization of the oil in the ground). Current technologies also make the development of future technologies easier by generating new ideas and possibilities.

Changing technologies, however, can have negative consequences for certain sectors or constituencies. Examples of negative aspects include pollution (including environmental, noise, and light pollution) associated with production processes, increased unemployment from labor-saving new technologies, and so forth. This suggests that society must consider the relative costs and benefits of new technologies.

The process of technological change can be seen to have three stages: invention, development, and diffusion. The invention stage involves the conception of a new idea. The idea might be about a new product or about a better technique for making existing products. The invention might be due to a latent demand (e.g., the cure for an existing illness); such inventions are referred to as demand-pull inventions. Inventions can alternately be supply driven, when they are by-products of the pursuit of other inventions. For instance, a number of products, such as the microwave oven, were by-products of the U.S. space program. Yet another possibility is that a new product or process might emerge as an unplanned by-product of the pursuit of another technology (serendipitous invention). In the development stage, the prototype of the invention or the idea is further developed and tested for possible side effects (as with pharmaceutical drugs) and reliability (as with vehicles and airplanes). The invention is also made user-friendly in this stage.

The final stage of the innovation process involves making it accessible to most users through market penetration. The benefits of an innovation, both to inventors and to society, are maximized only when the innovation is efficiently diffused. Some innovations are easy to adopt while others involve effort on the part of adopters. For instance, one must learn how to use a computer, a new type of software, or a new type of airplane. Thus, the diffusion of technologies takes time. A useful concept in this regard was provided by Zvi Griliches (1930–1999). Griliches examined the time path of diffusion for hybrid corn seeds. He found that the technology diffused like an S-curve over time, implying that initially diffusion occurred at an accelerated rate, then at a declining rate, and eventually the rate of diffusion tapered off. Various studies have examined the diffusion of other technologies (new airplanes, ATM machines, etc.), and generally the evidence seems to bear out the prevalence of the S-curve of diffusion.

There are different avenues of cooperation between the private and public sector in the three stages of innovation. For example, all three stages might take place in the same sector, or there might be cooperation in only some stages (e.g., government agriculture extension services subsidize the diffusion of many farming technologies).
Austrian economist Joseph Schumpeter (1883–1950) made significant contributions to the economics of technological change around the middle of the twentieth century. His best-known concept is referred to as the Schumpeterian hypothesis. According to this hypothesis, which linked market structure and innovation, monopolies (due to their large reserves) are perhaps better suited than competitive firms at bringing about new products and processes. This concept called into question the then widely held view that competitive markets were superior in all respects, and provided a redeeming feature of monopolies. Since its inception, the Schumpeterian hypothesis has been a matter of much debate and analysis in the economics literature.

The nature of technological change can vary across sector and products and over time. Broadly speaking, economists tend to classify technological change as Hicks-neutral, Harrod-neutral, or labor-saving (see, for example, Sato and Beckmann 1968). Under Hicks-neutral technological change, the rate of substitution of one input for another at the margin (think of substituting capital for one worker) remains unchanged if the factor proportions (i.e., capital-labor ratio) are constant. Harrod-neutral technological change refers to a constant capital-output ratio when the interest rate is unchanged. Finally, labor-saving technological change favors the capital input over labor. Numerous technologies involving increased computerization in recent years are examples of labor-saving technological change. Over time, researchers have conducted studies to test the nature of technological change for various sectors and countries.

A number of theories of technological change have been proposed by economists. Some of these theories have evolved over time by refinements of earlier theories, while others have benefited from new revelations. Adam Smith (1723–1790) recognized the role of changing technologies. According to him, improvements in production technology would emerge as a by-product of the division of labor, including the emergence of a profession of schedulers or organizers akin to modern-day engineers. A specialized worker doing the same job repetitively would tend to look for ways to save time and effort. In Smith’s world, productivity could also increase indirectly via capital accumulation.

Karl Marx’s (1818–1883) notion of the tendency of the rate of profit to fall stems from a recognition of technological change (process innovation) leading to more efficient production, and the replacement of labor with capital or machinery. Labor-saving innovation or mechanization occurs when Marx’s capitalists are unable to further lengthen the working day and therefore are unable to extract further surplus value in absolute form from labor.

Kenneth Arrow introduced the notion that production processes may be refined over time as workers gain greater knowledge from repeat action. Thus, new process technologies might emerge; such change is formally described as emerging from learning-by-doing. The degree of appropriability of research benefits was considered by Arrow to be a strong incentive for firms to engage in research and development. Nathan Rosenberg postulated that the degree of innovation opportunities dictates the research effort that firms put forth. For instance, innovation opportunities expand with new developments in basic science. Richard Nelson and Sidney Winter proposed an alternative theory of technological change. This theory, referred to as the evolutionary theory, argues that technological change evolves over time as newer generations (or improvements) of existing technologies are developed. In other words, the evolutionary theory considers technological change to be less drastic.

The process of technological change is uncertain in that there is no guarantee of whether, when, and at what scale the innovation will occur. Four types of uncertainties are generally associated with the process of technological change. One, there is market uncertainty resulting from the lack of information about the winner of the innovation race. For example, of the many pharmaceutical firms pursuing a cure for an illness, none is certain about who will succeed, or when. This uncertainty sometimes results in excessive resources being devoted to the pursuit of a particular innovation as firms try to improve their odds of beating others. Two, there is technological uncertainty regarding a lack of knowledge about research resources sufficient to guarantee success. Will a doubling of the number of scientists employed by a drug company double its odds of inventing a successful cure? Third, there is diffusion uncertainty regarding the eventual users and market acceptance of the innovation. Finally, there is uncertainty about possible government regulatory action that the new product or process might face. These regulations might deal with safety, reliability, or the environment.

The pace of technological change can vary across industries, firms, and countries, depending upon the resources devoted to research and the nature of products or processes pursued. For instance, the electronics industry, by its nature, has more room for technological improvement than, say, the paper industry. Governments try to increase the rate of technological change by various means. These measures include directly engaging in research, providing research subsidies or tax breaks, inviting foreign investment (and consequently technology) in specific industries, and strengthening the laws for protecting intellectual property. Sometimes, however, governments have to monitor the introduction of new products and processes to ensure societal well-being. Examples of such cases include drug-testing regulation and testing for
the environmental impacts of new technologies before they are introduced in the market.

In closing, our understanding of the process of technological change has improved over time. Technological change is an important input to a country's economic growth, and we owe a large part of our improving living standards to changing technologies. Some technologies, however, can have undesirable side effects. Another issue is that technological progress across nations is uneven, and the rapid diffusion of new technologies from developed nations to developing nations remains a challenge.

CHAOS THEORY

Chaos theory is a theory of systems dynamics; that is, the analysis of the laws of motion of various systems over time. Complex dynamics investigates why certain systems, while evolving in a predictable fashion for some time, may display at other times a behavior, which looks erratic (random), hence unpredictable. In this context, the main thrust of chaos theory has been to demonstrate that behind this seemingly random behavior or disorder, there is, however, a deterministic underlying structure, which can be described and analyzed by means of differential equations that do not involve uncertainty.

Formally chaos is a nonlinear deterministic process that looks random, a case in which a dynamic mechanism yields a time path so erratic that it passes most standard statistical tests of randomness. Chaotic time paths often have the following features: (1) a trajectory that sometimes displays sharp qualitative changes, such as those associated with large random disturbances; (2) a time path that is extremely sensitive to microscopic changes in the values of its parameters; and (3) a time path that never returns to any point it had previously traversed, but which may, however, display an oscillatory pattern in a certain bounded region. The terms chaos, strange attractors, and complex dynamics have been used interchangeably in the literature to characterize these complex processes.

In linear dynamics, small causes give rise to small effects, and large causes produce large effects. Hence there is a certain sense of proportionality in linear thinking. Nonlinearity, on the other hand, connotes lack of proportionality: very small causes (small changes in the initial conditions, for instance) can give rise to very large effects. One implication of chaos theory, in this context, is to show that nonlinearities are not the exception but the rule of nature and life. Weather forecasting, for instance, is difficult because very small fluctuations in the environment give rise to very large-scale changes. Chaotic systems often possess fractal structures and time-dependent feedback mechanisms. A fractal structure consists of two major features: self-similarity (or scale-invariance) and lack of smoothness. Self-similarity refers to a system that always looks the same regardless of how many times the system is magnified. On the other hand, lack of smoothness relates to the disconnected appearance of fractals.

While the origins of chaos theory date back to the seminal work conducted in 1890 by the French mathematician Jules Henri Poincaré on the so-called three-body problem, it is Edward Lorenz’s 1963 research on atmospheric dynamics and Benoît Mandelbrot’s pathbreaking 1983 investigation of fractal geometry that have rekindled interest in chaos theory since the mid-twentieth century. Applications of complex dynamics have found fertile grounds in several fields such as fluid dynamics, plasma physics, chemistry, electrical engineering, signal processing, cardiology, finance, and time series econometrics and economics, some of which are surveyed in Julian Sprott’s Chaos and Time Series Analysis (2003).

The roots of chaos analysis in economics can be traced back to the literature on business cycles, that is, the analysis of irregular fluctuations in the output level of an economy. While exogenous business cycle theories have become the orthodoxy during the last four decades, the emergence of chaos theory hinted at the possibility that erratic output fluctuations are due to the complex interaction of economic factors, and hence may be endogenously generated.
Chaos studies in theoretical economics have attempted to model economic systems in such a way that chaotic dynamics emerge during the adjustment period to equilibrium or in the evolution of the system itself over time. On the other hand, several empirical investigations have been done in order to identify chaotic behavior in financial and economic time-series data. While earlier empirical studies claimed to have found evidence of chaotic behavior in a number of economic time series, such as U.S. business cycle data, various monetary aggregates, and precious metal prices, subsequent research, such as that conducted by Aydin Cecen and Cahit Erkal in 1996, demonstrated that there is little evidence in favor of deterministic chaos in exchange rate returns.

CHÁVEZ, CÉSAR

1927–1993

Of Mexican American ancestry, César Estrada Chávez was born in Yuma, Arizona, with deep roots in the American Southwest. He was the second-born child of Librado Chávez and Juana Estrada, whose families were displaced from their land, much like many other Mexicans who were tricked by attorneys, had their loans rejected because others coveted their land, or lost their land as a result of owing back taxes. On August 29, 1937, the Arizona state government took possession of the Chávez family’s land, and later auctioned it off to the bank president who had refused the elder Chávez a loan to reclaim his property (La Botz 2006, p. 7; see also Montejano 1987 for a discussion of land displacement). The loss of their land forced the family to work in the agricultural fields of Arizona, and later in California’s San Joaquin Valley, beginning when César was just a child of ten. As migrants, the family struggled under the most difficult of conditions, including grossly substandard pay. Despite having only an eighth-grade education, Chávez served in the Navy during World War II (1939–1945). After two years of service, he returned to grueling agricultural work; there was not much else available for a man who lacked a formal education and whose employment options were limited by racism.

Chávez’s organizing career began as a result of a stint with the Community Services Organization (CSO), where he worked under the guidance of Fred Ross and Father Donald McDonnell in San José, California. After two years of struggle with CSO’s board, who refused to support many of his proposals, Chávez set out on his own to organize the agricultural workers’ union, using strategies he developed through his work with CSO, and guided by insights gained from personal experience of oppressive work conditions. Chávez patiently and systematically devised nonviolent strategies, such as the secondary boycott, which targeted specific businesses that bought goods from growers who refused to negotiate with or recognize the union. He also used fasting to highlight the shameful conditions under which farmworkers labored.

Chávez forged alliances with Filipinos and other workers of color and their families to organize the United Farm Workers Organizing Committee, which later became the United Farm Workers of America (UFWA). His ability to work in coalition with people of other faiths and political persuasions created lifelong partnerships, including with Gilbert Padilla and Dolores Huerta, who like him had been influenced by the pragmatic philosophy of Saul Alinsky’s Industrial Areas Foundation. Together the three organized the first table boycott and negotiated a contract with the Schenely Corporation, signed on April 7, 1966. This agreement marked the success of a national campaign that was carried out by the farmworkers themselves. Their effort also pointed the way toward the formation of national alliances with Democratic and liberal politicians, and drew the support of the United Auto Worker’s Union, as well as competition from the

REFERENCES

Teamsters Union, after the Schenely Corporation brought Teamsters to the negotiating table. Later, the Teamsters would vie for contracts against the UFW. Though his life work, Chávez created a revolution in agriculture and inspired the birth of the Chicano civil rights movement. His tireless support of American agricultural workers made him oppose governmental agreements such as the Bracero Program, which allowed Mexican workers to work in U.S. fields, and led him to fight against the use of undocumented workers, because they weakened unionization and adversely impacted the wages of Mexican Americans. Chávez was harshly criticized for these positions and lost the support of those who believe in workers’ rights regardless of origin, especially when he later sided with conservatives who pushed for immigration restrictions in the 1980s. Still, Chávez maintained enough support to achieve the first agricultural workers law in a nation that had not allowed the unionization of farmworkers in the past. This was the California Agricultural Labor Relations Act, signed by Governor Jerry Brown in 1975, which established the Agricultural Labor Relations Board (ALRB) to oversee elections and to settle appeals.

Because of Chávez’s willingness to confront racism and poverty in the agricultural fields, conditions for workers improved. The fruits of his labor included the eradication of the dreaded short hoe, the availability of portable toilets, the accessibility of drinking water, the creation of a hiring hall, the foundation of a service center and health clinic, and improvement of wages and benefits. A believer in nonviolence, Chávez continued to use legal means in his pursuit of social justice until the end. He passed away in Yuma, Arizona, working to fight a lawsuit against the UFW brought by Bruce Church Incorporated, the largest producer of lettuce and vegetables in Salinas, California. This was perceived as a move to destroy an already weak union; Church was suing the UFWA for millions of dollars in damages resulting from the 1980s lettuce boycott. In death, Chávez has become an icon, as a result of his activism and commitment to the struggle for farmworkers’ rights and social justice, a commitment he selflessly carried out to the end as he sought to improve the lives of those who feed the nation. For his extraordinary efforts and to mark the legacy of his accomplishments and his service to humanity, President Bill Clinton awarded Chávez with a posthumous Medal of Freedom in 1994. As Paul Chávez remarked in the San Jose Mercury News, “when history writes its final chapter, [César Chávez] … will be remembered as a man who lived by his principles and who wasn’t afraid of taking uncomfortable positions” (1993, p. 1A).

**CHÁVEZ, HUGO**

**1954–**

Venezuelan president Hugo Chávez and his policies have sparked controversy at home, throughout the Latin American region, and in the United States. Whereas Chávez’s supporters value his social agenda, critics perceive him as ideological, intolerant, and impractical. Chávez, however, has stayed in power through democratic means and carries overwhelming support, despite large-scale attempts to remove him from office.

Hugo Rafael Chávez Frías was born in Sabaneta, Barinas, on July 28, 1954. He graduated from Venezuela’s Academy of Military Sciences with a degree in engineering in 1975. Chávez first gained national attention in 1992 when he led an unsuccessful military coup to oust President Carlos Andrés Pérez. Chávez and a group of fellow military officers had founded the Revolutionary Bolivarian Movement ten years earlier; the group honored the nineteenth-century Venezuelan freedom fighter Simón Bolívar (1783–1830). Chávez sought to restore the Bolivarian ideas of national sovereignty, economic independence, and social services for the people. With these ideals, Chávez led the failed 1992 revolt, and was subsequently imprisoned for two years.

By 1994 Chávez had transformed from a “military rebel to a democratic player” (Canache 2002, p. 69). He founded the political party Movement of the Fifth
Republic leading up to the 1998 presidential elections. His platform emphasized his desire to end corruption, return oil to state control, and eliminate poverty (Marcano and Tyszka 2004, p. 31). This platform earned him political victory in 1998 with 56 percent of the vote, in 2000 with 60.3 percent, and in 2006 with 63 percent (Canache 2002, p. 69; Marcano and Tyszka 2004, p. 31; Political Database of the Americas). Chávez’s popularity has grown since he shifted from the military to the political stage.

Chávez’s mass appeal remains debatable. Scholars and journalists attribute his success to his emphasis on the country’s poor through health and education programs (Canache 2002, p. 70; Fukuyama 2007, p. A18). Francis Fukuyama writes that Chávez maintains local appeal because of his social agenda, in which he “has opened clinics staffed with Cuban doctors in poor barrios throughout Venezuela” (2007, p. A18). The rise in oil prices on the world markets has allowed the government to increase social spending despite the country’s external debt (Guevara 2005, p. 36).

However, critics argue that the statistics contradict the myth. Francisco Rodríguez argues that social spending in Venezuela decreased from 31.5 percent prior to Chávez’s administration to 29.3 percent by 2004. The reduction of illiteracy dropped slightly, from 1.1 million before Chávez became president to 1.0 million illiterate Venezuelans over the age of fifteen during his tenure (Rodríguez 2007, p. 2). The percentage of poor families increased from 42 percent in 1999 to 60 percent in 2004, and unemployment levels reached 15 percent in both 1999 and 2004 (Marcano and Tyszka 2004, p. 390). Instead, Chávez’s popularity is based on the country’s double-digit economic growth, according to Rodríguez.

Chávez’s opponents have threatened his grasp on power. In April 2002 rebel military officers staged a failed coup, which some Venezuelan officials believe was backed by the U.S. government (Morsbach 2006). Two years later, the opposition conducted a failed recall referendum, in which 59 percent of Venezuelans voted to allow Chávez to complete the remainder of his term (BBC News 2004).

As of 2007, Venezuela’s economy remained stable while a large number of Venezuelans lived in deep poverty. Nevertheless, Chávez’s support surpassed that of his critics.

CHECKS AND BALANCES

Although scholars dispute the precise origin of the phrase checks and balances, the basic idea of limiting political power through various institutional means is both ancient and modern. In the ancient worlds of the Greek city-state and the Roman Republic, a mixed constitution of the one, the few, and the many provided checks on governmental power, whether in the form of a monarchy (the rule of one), an aristocracy (the rule of the few), or a democracy (the rule of the many). This scheme of balancing and checking power, particularly as expressed in the works of Aristotle, Polybius, and Cicero, was a powerful influence in early modern Europe during the period of the Renaissance as expressed in the works of Niccolo Machiavelli, James Harrington, and Algernon Sydney. This ancient and Renaissance concept of a mixed constitution may also be found in the eighteenth-century works of Charles de Montesquieu, Francis Hutcheson, and William Blackstone. All of these works influenced the founders of the United States, notably John Adams, James Madison, and Thomas Jefferson. The classic literary study of the political dynamics in this scheme is William Shakespeare’s play Julius Caesar.

The modern concept of checks and balances derives primarily from a mechanical view of the universe made popular in the seventeenth and eighteenth centuries by Galileo Galilei and Isaac Newton, among others. For Alexander Hamilton, in Federalist No. 9, a concept of “legislative balances and checks” was among the modern
improvements in the science of politics. According to the modern view—as reflected in the United States Constitution—the legislative, executive, and judicial functions of government must check and balance each other in order to prevent any one branch of government from dominating the others. In the American scheme, for example, presidents may veto acts of Congress, but Congress has the power to override presidential vetoes by a two-thirds majority vote of both houses. Similarly, as established in the U.S. Supreme Court case of Marbury v. Madison (1803), federal judges may rule acts of Congress unconstitutional as occurred in the cases of City of Boerne v. Flores (1997) and Clinton v. City of New York (1998).

Checks and balances also refers often to issues of federalism, or the relationship between the national and state (or regional) governments. In the United States, for example, the Tenth Amendment to the United States Constitution grants “reserved” powers to the states. This has meant, according to the courts, the power of state governments in the United States to regulate health, safety, and morals. But the Fourteenth Amendment, ratified in 1868, checks this power by asserting that no state may deny any person “life, liberty, or property, without due process of law,” nor may a state deny “equal protection of the laws.” In a number of recent cases, the U.S. Supreme Court has interpreted these constitutional provisions so as to limit state prerogatives in such areas as capital punishment, affirmative action, privacy rights, and voting rights. For some, checks and balances also refers to modifications in American political practice outside of formal constitutional change or judicial interpretation. Among these modifications are the rise of national political parties, the expansion of presidential power, the creation by Congress of independent regulatory agencies (such as the Environmental Protection Agency), and changing technologies, particularly as these technologies make possible the more rapid exchange of information, such as through widespread access to the World Wide Web.

CHEROKEES

The Cherokees have been one of the most historically significant indigenous cultural groups in the southeastern United States. There were three federally recognized Cherokee Indian nations at the beginning of the twenty-first century: the Eastern Band of Cherokee Indians (EBCI) in North Carolina, the Cherokee Nation of Oklahoma, and the United Keetoowah Band in Oklahoma. In addition, more than fifty other organizations in at least twelve states, as well as many individuals, claim Cherokee descent. The question of who is legitimately Cherokee and how many individual Cherokee Indians exist in America is a point of contention, and the distinction between individual claims to cultural or biological identity, on the one hand, and legal membership or citizenship in federally recognized tribes or sovereign tribal nations, on the other, is an important one.

Other issues facing Cherokee communities in the early twenty-first century include development and refinement of mechanisms for self-governance, political factionalism, increased economic development of tribal communities (including gaming, tourism, and natural resource management on tribal lands), cultural preservation, and the implementation of tribal programs and services for media, education, health, mental health, and social services. Like many other Native American communities, the Cherokees face high rates of drug and alcohol dependency, suicide, and health issues such as diabetes, and communities are particularly concerned about their at-risk youth.

Cherokees and their ancestral culture, believed to be related to the Iroquois, have lived in the southeastern region for at least 12,000 years. Lands once occupied by the Cherokees—before European contact in the 1500s and then forced removal in the 1830s to Oklahoma—encompassed parts of what are now nine states, including most of the Southern Appalachian mountain and foothill region. From original lands that covered 250,000 square miles, the Eastern Band maintained its culture on approximately 56,000 acres in western North Carolina as of 2007; the tribal assets of the Cherokee Nation of Oklahoma include about 66,000 acres.
SOCIAL ORGANIZATION,
CULTURAL PRACTICES, AND
LANGUAGE
Unlike many of the Plains tribes, the Cherokees were primarily agricultural rather than nomadic and called themselves Ani'Yun'wiya, the Principal People. They are matrilineal and matrilocal, meaning that they trace their descent through the women in their society and they live in the mother's or wife's household, since women traditionally owned all property. Traditional Cherokee social organization was structured around seven matrilineal clans, run by a Council of Grandmothers, reflecting the relationship of balance between the natural and spiritual worlds: Anigilo(la)hi (Long Hair); Anisahoni (Blue or Panther); Aniwaya (Wolf); Anigatogewi (Wild Potato); Ani(k)awii (Deer); Antisiqua (Bird); Aniwodi (Paint). Each clan has traditional vocations, knowledges, and sacred ceremonial affiliations, and marriage within a clan is forbidden.

Throughout the Cherokee year, the communities have traditionally celebrated festivals or religious observances that reflected significant events related to the seasons, such as New Moon Festivals and Green Corn Ceremonies. Such events include feasting, dancing, purifications, sacred fires, and other ceremonies and rituals. The traditional Cherokee wedding is also a distinctive ceremony and a time for community celebration. Cherokees also actively participate in dances and ceremonies within the tribe as well as intertribal powwows to exhibit their traditional dance and music arts.

The arts have been a significant part of Cherokee culture and usually reflect the spiritual relationship between the Cherokees and the stone, wood, river cane, or clay from which various objects—baskets, pottery, carvings—are shaped. A revitalization of traditional arts is flourishing among the Cherokees through cooperatives and foundations such as the Qualla Arts and Crafts Mutual, Inc.

The Cherokee language, called Tsalagi, a member of the Southern Iroquoian language family, has a number of dialects and was spoken by about 22,000 Cherokees as of 2007 (only about 5 percent of the Cherokee population, due to nineteenth- and twentieth-century U.S. government policies punishing native speakers), although numbers are growing since it has become a required subject in many Cherokee schools and universities.

CHANGES WITH EUROPEAN CONTACT
Spanish explorer Hernando de Soto’s entry into Cherokee territory in 1540, in his search for gold and silver, forever changed the way the Cherokees lived. DeSoto’s party killed and enslaved many Cherokees, and the European invaders brought disease, death, and what would be permanent cultural dislocation to the Cherokees. Some estimate that as many as 95 percent of the Cherokee population died within the first two centuries of European contact.

By the eighteenth century, when waves of European settlers pushed westward into Cherokee territories, treaty lines were created but ultimately failed to protect the Cherokees from encroachment into their lands. Most of the remaining Cherokees reorganized and incorporated many aspects of European society into their dynamic culture to adapt to the changing demands of living near and among the new settlers. A more conservative faction, called the Old Settlers, voluntarily entered into a treaty with the U.S. government in 1817 to receive land in Arkansas in order to avoid assimilation; these were the ancestors of the United Keetoowah Band, the most conservative and traditional of the Cherokees.

A silversmith, Sequoyah, introduced a written form of the Cherokee language, called a syllabary, which was officially adopted by the Cherokee Nation in 1825. This led to widespread literacy and the publication of books, religious texts, almanacs, and newspapers. The tribe adopted a bicameral national government, a constitution, and a Supreme Court by 1827.

However, after white settlers discovered gold on Cherokee lands in north Georgia in the late 1820s, the state and federal government collaborated to confiscate Indian land and then offer this prized land to white settlers through land lotteries. President Andrew Jackson authorized the Indian Removal Act of 1830, beginning the tragic removal period when Cherokees were forced to leave behind their farms, homes, and land. However, the removal was not without opposition and a legal struggle.

Cherokee statesmen and leaders, such as Chief John Ross, and other Americans, including Daniel Webster, Henry Clay, and Samuel Worcester, passionately spoke out against removal and challenged Georgia’s attempt to extinguish Indian title to land. These legal cases—especially Worcester v. Georgia (1832) and Cherokee Nation v. Georgia (1831)—became the two most influential decisions in Indian law. The U.S. Supreme Court ruled for Georgia in the 1831 case, but in the 1832 case affirmed Cherokee sovereignty. However, President Jackson defied the Court and ordered the Cherokee removal, using as justification the 1835 Treaty of New Echota, a treaty that had been signed by about 100 Cherokees who agreed to relinquish all lands east of the Mississippi River in exchange for land in Oklahoma and the promise of money, provisions, and other benefits.

The signing and the removal led to bitter factionalism among the Cherokees. However, the U.S. Army, under General Winfield Scott, enforced the Removal Act in
1838 and forced about 15,000 to 20,000 Cherokees from their homeland. An estimated 4,000 died from hunger, exposure, and disease along the “Trail of Tears” by boats and on foot to Indian Territory in Oklahoma.

THE EASTERN BAND OF CHEROKEE INDIANS

However, hundreds of Cherokees in the mountains of North Carolina had been able to escape from forced removal in 1838, and their descendants make up the Eastern Band today. After several years of legal limbo, in 1848 the U.S. Congress agreed to recognize their treaty rights if the state would accept them as permanent residents; it was not until 1866, following the Civil War, that North Carolina agreed, and in 1868, the tribal tripartite government reconstituted and held its first elections since the removal. In the 1870s, the federal government established the Qualla Boundary (a reservation) for about 1,200 Cherokees. By 2006, over 13,000 enrolled members of EBCI lived on the Eastern Cherokee lands held in trust by the federal government.

The EBCI, incorporated in 1889, is a sovereign nation whose members are not subject to county property taxes or state income tax. Enrollment in the EBCI requires 1/32 degree of Cherokee blood through descent from an enrollee on the 1924 Baker Roll, a census carried out the same year that Native Americans were granted U.S. citizenship. Tribal governance is carried out by an elected principal chief and vice chief, a Tribal Council representing the various communities and clan townships, and appointed judicial positions.

Tourism and gaming are the two primary sources of economic development of the modern Eastern Cherokee, with an active tribal Office of Economic Development. With tribal lands nestled in the Blue Ridge and Great Smoky Mountains and surrounded by national parks and forests—as well as the cultural appeal of the Indian heritage attractions such as living heritage museums and an outdoor historical drama—tourism has long been the major economic base of the EBCI. Harrah's Cherokee Casino opened in 1997 and became the largest tourist attraction in North Carolina. The introduction of gaming has radically affected living conditions in what was once one of North Carolina's most impoverished areas, because of the advent of the per-capita distribution of tribal and casino profits to all enrolled tribal members (an amount totaling nearly $100 million in fiscal year 2004). In addition to tribal agencies, the independent Cherokee Preservation Foundation works to preserve Cherokee culture, create jobs and other economic development opportunities, and renew the environment on tribal lands.

THE CHEROKEE NATION OF OKLAHOMA

In Oklahoma, the Trail of Tears survivors soon rebuilt a democratic form of government, churches, and educational system, newspapers, and businesses, with Tahlequah as their capital and center of cultural activity. In 1844, the Cherokee Advocate, printed in both Cherokee and English, became the first newspaper in a Native American language, and the literacy level among the Cherokees became higher than among their white counterparts. Prosperity flourished until the Civil War, when most Cherokees sided with the Confederacy. The government divided what remained of Cherokee tribal land into individual allotments given to Cherokees listed in the Dawes Roll in the late 1890s. Descendants of those original enrollees make up today's Cherokee Nation tribal citizenship.

The Cherokee Nation has the sovereign right, granted by treaty and law, to control and develop tribal assets. With about 280,000 enrolled tribal members as of mid-2007, the Cherokee Nation is the largest American Indian tribal nation (followed closely by the Navajo Nation with approximately 250,000 enrolled members). The land base remaining under federal trust relationship comprises more than 90,000 acres consisting of half tribal land and half allotment land belonging to individual tribal members.

The Cherokee Nation has a tripartite democratic government with a constitution, revised in 1976. Executive power is vested in the elected principal chief, legislative power in the elected Tribal Council, and judicial power in the Cherokee Nation Judicial Appeals Tribunal, comparable to a Supreme Court. It is the highest court of the Cherokee Nation, and it administers the Cherokee Nation Judicial Code as well as district courts and a law enforcement system.

The Cherokee Nation operates several enterprises, including Cherokee Nation Enterprises, which owns casino facilities, retail outlets, and Cherokee Nation Industries, Inc., a supplier to several major defense contractors. The Cherokee Nation also owns a landfill, golf course, ranch, and apartments for the elderly and disabled, and in total employs about 7,000 people, most of whom are tribal members.

Chiang Kai-Shek

1887–1975

Chiang Kai-shek was a Chinese political and military leader who took power after the death of Sun Yat-sen (1866–1925). Born into a salt-merchant family in Zhejiang province, Chiang’s education included a military academy in Japan from 1908 to 1910, during which time he joined the anti-Manchu movement called the Revolutionary Alliance and became a disciple of Sun, the leader of Guomindang, the Nationalist Party.

In 1923 Sun took Russian advice to accept the Chinese Communist Party as an ally for his cause of national revolution and sent Chiang to the Soviet Union for military training. Upon his return Chiang was appointed head of the Whampoa Military Academy, which later became the most important political capital for Chiang, as many cadets had a personal allegiance to him. In 1925, upon Sun’s death, Chiang became the new leader in the Guomindang and soon launched the Northern Expedition (1926–1928), the military campaign against the northern warlords, to unify the country. After a military success Chiang decided that he could not tolerate the Communists, who had been his ally during the expedition but who also began to encourage workers and peasants to launch a social revolution. He ordered a bloody suppression of Communists and labor activists in Shanghai, and his cooperation with the Communists was broken. Chiang established the Nationalist Government in Nanjing on April 28, 1927, six days after the Shanghai massacre.

Chiang’s government made efforts to modernize the country, and his governing ideology was a mixture of Confucianism and European fascism. But Chiang faced challenges both at home and from abroad. In 1931 the Japanese occupied Manchuria by force and created a national crisis for Chiang, who decided to take issue with the Communists first before facing foreign invaders. The Communists, led by Mao Zedong, established rural bases through a policy of land redistribution. Despite continuous suppression from the government, the Communists survived and received popular support, first in Jiangxi in the southeast then, after the Long March, in Shaanxi in the northwest. In December 1936 Chiang was kidnapped in Xian by his military deputy, Zhang Xueliang (1898–2001), who resented Chiang’s policy of not fighting the Japanese. The crisis ended peacefully as Chiang agreed to work with the Communists in fighting the common enemy. During the second Sino-Japanese War (1937–1945), Chiang remained China’s national leader although the country was divided. The United States and China became allies during the war, but Chiang had a rocky relationship with his chief of allied staff, American general Joseph Stilwell (1883–1946), who was finally recalled by Washington in 1944. The American advisors were dismayed by the corruption of Chiang’s government, as well as its ignorance and indifference.

Under Mao’s leadership the Communists grew stronger during the war. Civil war broke out between Chiang’s government and the Communists soon after World War II ended. Despite strong American financial and military support, Chiang lost the war, and his government was forced from the mainland to Taiwan. Chiang remained the president of the Guomindang Government, an authoritarian regime long supported by the United States, until his death in 1975.

CHIAPAS

Chiapas is a land of stark contrasts: geographically, economically, and socially. One can find everything from frigid mountains to steaming jungles, from poor peasant farmers to wealthy oil executives, and deeply rooted ethnic differences between indigenous Maya and ladinos (those who trace at least part of their ancestry to Spain).

Chiapas is Mexico’s southernmost and eighth most populous state (3.9 million in 2000). Most residents live in rural areas. Only three cities have more than 100,000 inhabitants: Tuxtla Gutierrez, the political and economic center, Tapachula, a coastal port, and San Cristobal de las Casas, a colonial city in the highlands. Chiapas’s population is also the youngest in all Mexico with 50 percent at twenty years of age or younger. Many are indigenous; over 25 percent speak one (or more) of Chiapas’s Mayan languages (Tzotzil, Tzeltal, Chol, Tojolobal, to name only the most common). Most are Catholic (64%), with a growing number of Protestants (14%), and a few Jewish, Muslim, and those without religious beliefs.

Agro-extractive industries dominate. Chiapas is one of Mexico’s leading producers of coffee, corn, cattle, and cocoa. From Chiapas comes 54 percent of Mexico’s hydroelectric power, 24 percent of its crude oil, and 47 percent of its natural gas. However, broad scale economic and social development was historically a low priority and not everyone has benefited equally. Twelve percent of homes lack electric power. Twenty-six percent of homes lack running water, and 43 percent adequate sewage. Fifty-three percent cook with wood. Chiapas also has the highest rate of illiteracy in Mexico (22%), the fewest doctors per person (1 per 17,856), and the second lowest life expectancy (sixty-seven years).

Inequities, exploitation, and ethnic distinctions began in the colonial period and continued after independence. In 1528 the Spanish conquistador Diego de Mazariegos subdued the indigenous populations of Chiapas. Chiapas had no mineral wealth, no gold, no silver. Its riches were agricultural products, including cochineal (red dye), cocoa, sugarcane, and tobacco, and forced indigenous labor, granted to Spaniards by the Crown, made their production possible. The conditions were so extreme and treatment so cruel that many died, others fled, and some rose in rebellion (the Tzeltal Rebellion of 1712, the Tzotzil Uprising of 1868). Independence in 1824 changed the form but not the nature of relations between indigenous and ladino. Liberal reforms privatized land held by the Catholic Church and indigenous communities. In Chiapas, ladinos used these reforms to obtain title to vacant lands, which often belonged, though not officially, to indigenous people. On these they established coffee and cattle ranches and obligated the very indigenous from whom the land had been taken to work for them, in forms often bordering on slavery. Thereby the general trend of wealthy landed ladino and poor landless indigenous continued.

Inequitable landholding was one of the causes of the Mexican Revolution in 1910 and land became a focal point for indigenous organizing in Chiapas. Article 27 of the Mexican Constitution of 1917 granted landless people the right to petition the government for land, which the government could expropriate from large landowners. The process was long and drawn out, pitted landless indigenous against landed ladino, and often required secretive organizing, land invasions, and armed confrontations. Indigenous organizing grew throughout the century, especially in the 1970s and 1980s, so that by 1992 over one-half the land in Chiapas was ejido (commonly held) and the indigenous had gained control of many local political offices and some commerce.

In 1992 the Mexican president Salinas de Gortari changed the constitution, abolished the ejido, and in so doing dashed the hopes of many landless poor and exacerbated political unrest. That unrest came to a head in 1994 with the Zapatista Rebellion. The day that the North American Free Trade Agreement (NAFTA) took effect poor, largely indigenous men and women—the EZLN, Zapatista Army of National Liberation—rose in rebellion. The Zapatistas had begun organizing in 1984 and voted to go to war in 1992. As their charismatic leader, subcomandante Marcos, put it, “If you don’t have land, you’re living dead, so why live. It is better to die fighting” (Russell 1995, p. 40). The Zapatistas demanded a wide range of social and political reforms. By 1996 the government and the Zapatistas had negotiated an uneasy truce. The Zapatistas refuse anything having to do with the “bad government,” but receive important contributions from abroad. The government offers many forms of aid to those who reject zapatismo and acknowledge the government. In their intransigence both sides have polarized the countryside, pitting, to unprecedented degrees, indigenous against indigenous; the most devastating manifestation being the massacre in Acteal, during which more than fifty women and children, of a nonviolent Zapatista faction, were brutally murdered by a pro-government faction.

From the mid-1970s to the present, Chiapas has seen many changes: large-scale indigenous organizing, religious conversions, and rebellions. More so than ever before people migrate to cities in search of opportunity and, almost unheard of in the 1990s, residents, especially the young, leave Chiapas by the thousands bound for the United States.

CHICAGO DEFENDER
It can be argued that the most influential and radical voice for racial equality in the first quarter of the twentieth century was a Chicago-based newspaper, the Chicago Defender. Within the paper’s first ten years of publication, its owner, Robert S. Abbott, had turned the one-time local black paper into the largest selling black newspaper in the United States. Scholars estimate that weekly circulation from 1915 to 1925 was as high as 250,000 a week, with the large majority of the copies distributed south of the Mason-Dixon Line.

With its sensationalistic and crusading editorial policy, the paper quickly gained the reputation of being the most radical and racially conscious black newspaper in America. This bold editorial philosophy was never more evident than during the turbulent period between 1916 and 1919, the epoch marked by America’s involvement in World War I, the Great Black Migration out of the South, and the northern race riots of 1919.

The first of these events to grab the Defender’s attention was of the mistreatment of black soldiers in military training camps during the early years of World War I and the exclusion of prominent “race men” from the ranks of officers. The paper unflinchingly demanded safety, equal rights, and recognition for black soldiers who sacrificed their lives for freedom in Europe. Abbott was also diligent in underscoring the hypocrisy of the United States government, which asked men of color to die for the cause of liberty in Germany while it systematically denied them their basic civil rights at home.

While maintaining its concern for the black soldier in Europe, the Defender also began detailing both the atrocities inflicted on blacks in the American South and the burgeoning opportunities awaiting them in the industrialized North. By 1916, the recognition of this juxtaposition had evolved into a full-scale migration campaign. Abbott and his paper began encouraging a southern exodus away from the oppressive South and toward the “Promised Land” of the North. Black southerners read of the thousands who had already said, “FAREWELL TO THE SOUTH” (January 6, 1917) or of the “2 MILLION NEEDED” (October 4, 1916) to work in America’s second city. They memorized Mr. Ward’s poem, “Bound for the Promised Land,” sang William Crosse’s inspirational words to “The Land of Hope,” and laughed at Fon Holly’s political cartoons, “DESERTION” and “THE AWAKENING” (September 2, 1916, and August 19, 1916).

In the spring of 1919, however, the Defender’s “Promised Land” was undergoing a metamorphosis. As thousands of white soldiers returned home after the war, they found that the jobs, communities, and lifestyles they had left behind in Chicago were appropriated by thousands of black migrants.

This tension ultimately led to a three-day (July 27–30, 1919) race riot in Chicago—an event that forever changed the tenor of the Defender’s migration discourse. The bold headlines of the paper’s August 2, 1919, issue summarized the situation: “RIOT SWEEPS CHICAGO,” and “GHASTLY DEEDS ON RACE RIOTERS TOLD.” When the dust settled, 23 blacks lay dead, with at least 537 others wounded. The call for southern migration ceased after the (blood) “Red Summer” of 1919. Abbott could no longer promise his readers a better life in his once-beloved city of Chicago.

In 1940 John H. Sengstacke, Abbott’s nephew, assumed editorial control of the paper. Under his leadership, the Defender protested the treatment of African American servicemen fighting in World War II (1939–1945) and, once again, called for the integration of the U.S. armed forces. Facing the threat from the U.S. government of sedition charges, however, the Defender attenuated its traditionally radical editorial policy.

On February 6, 1956, the Defender became a daily newspaper. Nine years later, Sengstacke again expanded his influence as a voice for black equality by purchasing three additional black papers: the Pittsburgh Courier, the Michigan Chronicle in Detroit, and the Tri-State Defender in Memphis.

By the 1970s, however, the Defender, like many of the nation’s other black newspapers, began to rapidly lose readership. At the time of Sengstacke’s death in 1997, the Defender’s circulation declined to less than 20,000. In 2003 Abbott’s heirs were forced to sell the legendary Chicago Defender to black-owned Real Times, Inc.

Chicago School

The post–World War II (1939–1945) period saw the emergence at the University of Chicago of a significant alternative in economics to both the tradition of American institutionalism and the emerging traditions of Keynesianism and general equilibrium theorizing. Usually associated with the work of Milton Friedman (monetarism) and George Stigler, and their students Gary Becker and Robert Emerson Lucas, the Chicago approach to economics is also present in the agricultural and development economics of Theodore W. Schultz, D. Gale Johnson, and Zvi Griliches; the labor economics of H. Gregg Lewis, Al Rees, and Sherwin Rosen; the industrial economics of Lester Telser, Harold Demsetz, and Sam Peltzman; the law and economics of Aaron Director, Ronald H. Coase, and Richard Posner; the economic history of Robert Fogel and Deidre McCloskey; the international economics of Harry Johnson and Arnold Harberger; and the social economics of Kevin Murphy and Steven Levitt. Two themes tie together these various manifestations of the Chicago approach: in each of them, Marshallian price theory is taken seriously, and economics is understood to be an applied science.

At a time when the economics discipline was moving toward both formalized general equilibrium models and refined econometric techniques, Chicago economists continued the interwar tradition of price theory taught by Jacob Viner and Frank H. Knight. From 1930 to the mid-1980s, graduate students read and reread a canon of books and essays by Viner, Knight, Henry Simons, Friedman, Stigler, Coase, and Becker to gain an intuitive appreciation for how economics could be applied to any social or economic problem. As Friedman’s 1953 essay “The Methodology of Positive Economics” made clear, the Chicago approach applied a small set of simple tools to economic problems because they retained their predictive success despite their generality. Chicago’s predilection for the application of price theoretic models to policy issues was also supported by the analytical egalitarianism of Becker and Stigler’s 1977 essay “De Gustibus Non Est Disputandum”: look for explanations of economic change in the set of cost constraints individuals face, because people across time and place are assumed to hold similar values and tastes.

The methodological underpinnings of the Chicago approach were driven home to graduate students and faculty alike every week in the workshops that met regularly in the University of Chicago’s Department of Economics, Graduate School of Business, and Law School. Starting in the mid-1940s, the workshops became the locus of most research and graduate training in economics at Chicago. After passing comprehensive examinations at the end of the first year, graduate students associated themselves with one or more workshops. Each workshop met weekly for critical examination of papers by faculty members, invited external guests, or senior graduate students. Most workshops functioned by “Chicago rules”: papers were distributed prior to the meeting, which was devoted to discussion, rather than presentation, in order to uncover the methodological, theoretical, or empirical problems in the paper. The collective enterprise embodied in the workshop model encouraged faculty and graduate students to pursue interesting applications of price theory in settings where it was commonly understood to not be applicable: antitrust and anticompetition policy, economic development, crime and habitual behavior, law, religion, corporate finance, the family, history, and politics. In all these areas, Chicago economics extended the reach of the discipline by showing that useful, empirically based criticisms of policy frameworks could be built upon basic price-theoretic analytical foundations (Reder 1987).

Chicago economics has not shied away from controversy, either internal or external. The circle around Knight sparred with institutionalists and empirical economists within and outside the department during the 1930s and 1940s. From 1939 to 1955, the University of Chicago was the home of the Cowles Commission, a leader in formal modeling and hence at odds with the Chicago School approach. Alfred Cowles brought Oskar Lange, Jacob Marschak, and Tjalling Koopmans to Chicago, and played an important role in the development of both econometrics and Walrasian general equilibrium theory. The creation of the Shadow Open Market Committee in the early 1970s provided a public forum for the long-standing dispute between Chicago monetarists and the Federal Reserve System’s general Keynesian orientation. Finally, the Chicago department’s long-standing relation with Latin American students became the center of controversy when a group of Chicago-trained economists became the architects of economic transformation in Chile under General Augusto Pinochet. The impact of Chicago-inspired reforms there contributed to the spread of the Chicago approach across the developing world, and
became the center of a global debate over privatization and market-based reforms.

CHIEF JOSEPH

c. 1840–1904

Chief Joseph, or Hin-mut-too-yah-lat-kehkt (Thunder Rolling in the Mountains), was the outstanding leader from 1871 to 1904 of the largest and most influential band of nontreaty Nez Perce Indians. He was also one of several leaders who directed his people through the Nez Perce War of 1877 and the valiant but doomed effort to resist forced removal from their homeland in the Wallowa Mountains of northeastern Oregon.

Like many terms for American Indian people and places, Nez Perce is a misnomer. French traders first applied the term, attributing to the entire people an only occasional practice of nose piercing. The Nez Perce people refer to themselves as Nimíipuu, which translates roughly as “we people.” Compared to their far more warlike eastern neighbors of the upper Plains, until the mid-nineteenth century the Nez Perce were mostly hospitable to American colonial agencies such as schools and missionaries. This relationship changed fairly dramatically shortly after the Treaty of 1855.

Joseph, born around 1840, was the son of Tuekakas, also known as Old Joseph, himself a powerful leader of the Nez Perce. Although some debate persists, Tuekakas was apparently a signatory to the Treaty of 1855 wherein a great deal of Nez Perce land was ceded to the United States in exchange for annuities. This treaty, which was abrogated by the U.S. government’s failure to provide the promised annuities, began the process of Nez Perce expropriation that created a more or less permanent schism among the Nez Perce bands, and had a host of other pensive effects.

Joseph succeeded his ailing father as leader of the Wallowa Valley band of Nez Perce in 1871. He inherited a complex and finally insurmountable set of cultural and political problems that can be traced most directly to the Treaty of 1863, which came to replace the abrogated Treaty of 1855. The Treaty of 1863 formalized the division of the Nez Perce into “treaty” and “nontreaty” factions. The “upper” Nez Perce, represented by a man named (ironically) Lawyer, agreed to a massive sale of territory that included the Wallowa Valley. Critically, however, four Nez Perce bands, including Joseph’s, did not sign and flatly refused the terms of the treaty. U.S. officials nevertheless asserted Lawyer’s authority to cede, effectively, his neighbor’s land. The U.S. government thus asserted that Joseph’s homeland was federal territory, an assertion emphatically not shared by Joseph, his father, and the Wallowa Valley Nez Perce. Federal claims to the Wallowa Valley did much to precipitate the momentous Nez Perce War of 1877 and brought national attention to the Nez Perce and Chief Joseph.

Joseph made his first appearance as the principal representative of his people at a meeting with U.S. agents in March 1873. The U.S. position was that Joseph’s band must leave Wallowa and move onto the Lapwai Reservation. Joseph responded to the demand unequivocally:

The white man has no right to come here and take our country.... Neither Lawyer nor any other chief had authority to sell this land. It has always belonged to my people. It came unclouded to them from our fathers, and we will defend this land as long as a drop of Indian blood warms the hearts of our men. (Howard 1978, p. 92)

Joseph impressed the U.S. representatives with both the quality of his character and his legal arguments. Consequently, an executive order from President Ulysses S. Grant withdrew the Wallowa Valley from settlement;
however, this order, hotly contested by settlers, was reversed in 1875. In 1877 the U.S. Department of the Interior made the decision to compel Joseph and his band, by force if necessary, to remove to the Lapwai Reservation.

U.S. agents and representatives of Nez Perce non-treaty bands held a final council at Lapwai in 1877. The council went very badly for the Nez Perce, and their extraordinary record of peacefully tolerating a host of injustices came to an end. Although it appears that Joseph, with the utmost reluctance, agreed to remove to Lapwai, he and the other non-treaty bands were overtaken by events when a few young Nez Perce warriors exacted revenge killings on several settlers. Thus the Nez Perce war of 1877, the final significant conflict of the era of Indian wars, began.

The Nez Perce fought a brilliant running battle, complete with narrow escapes and decisive victories, against U.S. forces for several months and over 1,700 miles. In October 1877, after the Battle of the Bearpaw Mountains, they were finally surrounded and forced to surrender, a day’s march short of refuge in Canada. Joseph was the only principal Nez Perce leader to survive the hostilities, so the surrender agreement fell to him, and he responded with one of the most powerful examples of American Indian oration that we have on reliable record. The oration famously concludes: “Hear me, my chiefs. I am tired; my heart is sick and sad. From where the sun now stands I will fight no more forever” (Howard 1978, p. 330). The sun stood at 2:20 p.m. on October 5, 1877.

In violation of the assurances made to Joseph by Colonel Nelson Miles at the surrender, Joseph and the remaining Nez Perce were interned on reservations in Kansas and then Oklahoma for the next twelve years. In 1885 they were moved to the Colville Indian Reservation in eastern Washington. Chief Joseph died September 21, 1904.

CHILD BEHAVIOR CHECKLIST

The Child Behavior Checklist for Ages 6 to 18 (CBCL/6–18) is a standardized questionnaire for assessing children’s behavioral, emotional, and social problems and competencies. It can be self-administered by parent figures or administered by interviewers. A version for ages one-and-a-half to five years (CBCL/1.5–5) assesses language development as well as problems. These questionnaires are components of the Achenbach System of Empirically Based Assessment (ASEBA). The ASEBA also includes questionnaires completed by preschool teachers and daycare providers (for ages one-and-a-half to five), school teachers (for ages six to eighteen), youths (ages eleven to eighteen), clinical interviewers, observers, and psychological test administrators. Additional ASEBA questionnaires are available for assessing adults (ages eighteen to fifty-nine and sixty to ninety-plus). Because behavior may vary from one situation to another, the different questionnaires are designed to capture both the similarities and differences in behavior across different situations, as seen by different people.

Starting in the 1960s, psychologist Thomas Achenbach began developing the ASEBA to provide practical, low-cost measures of problems and competencies for clinical and research purposes. Statistical analyses of ASEBA questionnaires have identified syndromes of problems that are scored on profiles. The profiles display an individual’s scores on syndrome scales in relation to norms for peers of the same age and gender. Examples of syndromes include attention problems, aggressive behavior, anxiety/depression, and social problems. Additional scales are provided for scoring broad groupings of problems designated as internalizing (problems within the self) and externalizing (conflicts with others and with social mores).

ASEBA forms are also scored on DSM-oriented scales that consist of problems identified by international panels of experts as being consistent with diagnostic categories of the American Psychiatric Association’s Diagnostic and Statistical Manual of Mental Disorders (DSM-IV, 1994). Examples of DSM-oriented scales scored for ages six to eighteen include anxiety problems, attention-deficit/hyperactivity problems, oppositional defiant problems, and conduct problems.

ASEBA questionnaires have been translated into over seventy-five languages. Their use has been reported in some six thousand publications from sixty-seven countries. The publications span hundreds of topics, such as child abuse, adoption, aggression, bullying, anxiety, asthma, autism, cancer, cross-cultural findings, delinquency, depression, diabetes, stress, substance abuse, suicidal behavior, and treatment. ASEBA questionnaires, lists of translations, research summaries, and other informa-
A multicultural computer program provides norms based on parent, teacher, and self-reports obtained for tens of thousands of children and youth from over thirty countries. This program enables users to compare individuals’ scores with norms for various groups of countries. It is valuable for assessing children residing in their own countries and also for assessing immigrant children living in host countries. A Web-based application enables users to transmit questionnaires electronically and respondents to complete questionnaires on the Web. The ASEBA is widely used in mental health services, schools, medical practices, and family service agencies, health maintenance organizations, public health agencies, child guidance, training programs, and research.

No assessment instrument can tap every characteristic that might be potentially relevant to every individual in every culture. Consequently, people completing ASEBA questionnaires are invited to add problems and strengths not already listed and to provide open-ended descriptive information. Because no single source of data is sufficient for comprehensive assessment, users are urged to obtain data from multiple informants and multiple assessment procedures. Users are also advised that no scores on ASEBA scales should be automatically equated with particular diagnoses or disorders. Instead, users should integrate ASEBA data with other types of data to provide comprehensive evaluations of functioning.

Most ASEBA forms are designed to be self-administered by people having at least fifth-grade reading skills. However, for people who are unable to complete the self-administered forms independently, interviewers without specialized training can read the questions aloud and record the respondent’s answers. The Test Observation Form (TOF) and Semistructured Clinical Interview for Children and Adolescents (SCICA) require training in direct assessment of children. The Direct Observation Form (DOF) requires training in observation of children in group settings, such as classrooms. Interpretation of data from all ASEBA instruments requires training in standardized assessment equivalent to the master’s degree level in psychology, education, or related fields, or two years of residency in medical specialties such as psychiatry or pediatrics.

Critiques of ASEBA questionnaires have been published by Amanda Doss (2005), Robert McMahon and Paul Frick (2005), and Robert Spies and Barbara Plake (2005).

**CHILD DEVELOPMENT**

Child development is the study of the different processes assumed to influence human growth and development from birth through adolescence. Development takes place within multiple domains (e.g., cognitive, physical, socio-emotional). Yet the processes underlying development can be common across the different domains of development.

**TYPES OF PROCESSES THAT INFLUENCE DEVELOPMENT**

In-wired Development Although human beings grow and develop at different paces, there are some aspects of development that are consistent for most, if not all, human beings. This consistency suggests that human bodies are designed to grow and develop in a relatively sequential and orderly fashion because the mechanisms responsible for these changes are *in-wired*. That is, these mechanisms are present at birth and are essentially time-released through adolescence and beyond. For example, an infant will exhibit a grasping reflex when his or her palm is...
touched. At a later stage, that same infant will develop greater strength and more finely tuned motor skills, such as the ability to intentionally pick up and manipulate an interesting toy.

Development Through Acting Upon the Environment
Children are born with sense systems (i.e., vision, smell, hearing, taste, and touch) that allow them to explore and act upon people and objects in their environments. Children may throw different things to see if they bounce or make interesting sounds (e.g., balls, cups, keys). They may place different things in their mouths (e.g., their mother’s fingers, rattles) to see if they are hard or soft or can fit inside their mouths. Children may perceive certain smells and associate them with different experiences. It is through active exploration that children begin to learn the properties of different things and relate them to other things that they “know.”

Development Through Passive Reactions to the Environment
Children’s development can also be stimulated by their exposure to the activities that take place in the contexts in which they live. For instance, language development is stimulated by immersion within specific language environments. Researchers have found critical periods in early infant development whereby simple exposure to everyday conversation helps children develop the ability to produce certain phonemes (speech sounds) specific to a language. If immersion within specific language environments occurs after a certain period—approximately six to nine months of age—then the child will not be able to make some speech sounds in the same manner as a native speaker.

DIFFERENT DOMAINS OF CHILD DEVELOPMENT
Child development researchers seek to identify and understand age-related developmental changes and abilities and how outside influences such as context (e.g., Urie Bronfenbrenner’s ecological systems theory) and culture (e.g., A. Wade Boykin’s triarchic theory of minority child development) affect developmental outcomes. Below are brief descriptions of the different domains in which development can take place.

Biological Domain
Physical development refers to the development of the entire human body, including changes in physical stature and strength, pubertal changes in adolescence, the development of perceptual and motor skills, and brain development. Arnold Gesell’s (1880–1961) maturational theory proposed that children’s growth and development is biologically driven and unfolds in a series of fixed sequences or milestones in physical, motor, and perceptual domains. Although children vary in their rates of development (e.g., they don’t all start to crawl or talk at exactly the same age), they all progress through the same sequences.

Sensory and perceptual development
Perception is the organization and interpretation of information received through our senses. Although sensory systems are functional at birth, they are not yet mature. In The Construction of Reality in the Child (1954), Jean Piaget (1896–1980) asserted the belief—also held by other theorists—that senses function independently at birth, and with development and experience become more interconnected. By interacting with the environment, children actively construct an understanding of the world, gradually making connections between different types of sensory information.

Other theorists, such as Eleanor Gibson (1910–2002) in Principles of Perceptual Learning and Development (1969), argue that the main task of perceptual development is for children to discover the function or permanent properties of objects. Gibson developed the first visual cliff method to assess depth perception. The visual cliff strategy helped demonstrate that most infants refused to crawl over the edge of a small cliff with a dropoff covered by glass. Their refusal to crawl over the “edge” was assumed to indicate that they could perceive depth and that depth perception is not learned. Rather, the environment is learned in that it contains information necessary for individuals to make decisions about how to navigate it (e.g., where to walk and not walk). These experiences demonstrate the interconnections between the child’s physical world and cognitive development.

Cognitive Domain
Piaget’s theory of cognitive development describes how children construct an understanding of the world by interacting with their physical and social environments. Children adapt to their environments by developing mental organizations, or schemes, to organize their understanding of the world. Adaptation consists of two processes—assimilation and accommodation. Assimilation involves fitting new information into existing schemes (e.g., a child calling a cat “doggy” because it has four legs and fur). Accommodation involves altering existing schemes to accept new information (e.g., a child altering his or her scheme for “doggy” to include barking so that the scheme can no longer include cats).

Lev Vygotsky’s (1896–1934) sociocultural theory stresses the importance of social interactions to cognitive development. Vygotsky asserted that learning is a socially mediated, cultural activity that takes place within the zone of proximal development (ZPD). Specifically, the ZPD denotes the difference between what children can do on
their own and what they can accomplish with the support of more knowledgeable individuals from their culture.

It is important to note that what and how children learn is influenced by their cognitive developmental status. For example, children might be able to learn and repeat complex words and phrases in middle childhood, yet not be able to understand them conceptually—in abstract terms—until adolescence.

**Psychosocial Domain**  
*Socioemotional development.* There are critical precursors of social and psychological development. For instance, *attachment* refers to the development of an emotional bond between infant and mother or primary caregiver. Mary Ainsworth (1913–1999) developed the *Strange Situation* to determine the quality of the attachment between caregiver and child. This strategy assesses children’s reactions to their mothers after their mothers leave them alone in a room that is later entered by a stranger. The strategy assumes that if a child reacts in negative ways to the mother upon return, there is a poor relationship between caregiver and child. The importance of attachment to socioemotional and cognitive development was recognized by studies of infants in orphanages during the 1950s and 1960s. In the absence of an attachment relationship, these infants experienced severe developmental delays.

*Ego-identity development.* Sigmund Freud (1856–1939) believed that personality is formed in the first years of life as children deal with inner conflicts. Erik Erikson (1902–1994) extended Freud’s theory, proposing that development unfolds in a series of stages spanning infancy to old age. Each developmental stage involves a challenge and corresponding consequence if that challenge is not met. For example, during infancy the challenge is for infants to develop a sense of trust in the world based on responsive caregiving. If the infant’s needs are not consistently met, the infant does not trust that the world is a safe place. This sense of mistrust affects children as they get older and face the developmental challenge of becoming more independent from their parents during adolescence.

While Erikson would characterize adolescence as the period in which identity development is the primary challenge to be resolved, the precursors of identity development can be recognized much earlier. Identity develops along a number of dimensions (e.g., gender, race, ethnicity, social class, physical ability, etc.). Often, different aspects of identity will only become salient for individuals when they become aware of specific differences between themselves and others (e.g., skin color, socioeconomic status, abilities, etc.). Children become aware of differences in treatment and the presence of stereotypes.

Mamie Phipps Clark (1917–1983) and Kenneth Clark (1914–2005) used doll studies to demonstrate the early awareness of social devaluation and negative racial stereotypes. The Clarks posited that black children become aware of racial stereotypes and develop personal racial preferences early in childhood. Doll studies are experimental strategies using dolls that do and do not share characteristics of a child (e.g., gender, skin color, clothing) in order to determine what and with whom a child identifies and the characteristics a child attributes to himself or herself. This strategy assumes that what children believe about the dolls can be indicative of their beliefs about themselves and their sense of identity and self-esteem. In 1954 the Clarks’ research was used in a landmark U.S. Supreme Court case, *Brown v. Board of Education*, to demonstrate that segregation—which limited black American’s access to high-quality educational institutions and other resources readily available to white Americans—resulted in low self-esteem among African American children. Specifically, the children in the Clarks’ studies associated being black (or having dark skin) with negative connotations (i.e., bad, dirty, not smart).

About twenty years later, Margaret Beale Spencer revisited the Clarks’ work, demonstrating how cognitive egocentrism—a normative, cognitive developmental process—can protect the identity development of young black children, allowing them to maintain high self-esteem despite their awareness of negative racial stereotypes. That is, when they are still cognitively egocentric, children can be aware of color connotations yet not apply their “knowledge” of color connotations to themselves. Spencer’s subsequent research demonstrates how improvements in the ability to assume the perspectives of others and how becoming less cognitively egocentric in later developmental stages—another normative cognitive developmental process—results in cognitive dissonance. That is, in the absence of positive racial socialization, young people face the difficult task of reconciling their perceptions of societal stereotypes with their perceptions of themselves and others who share their physical characteristics (i.e., phenotype). In contrast to the Clarks’ research, Spencer demonstrates both the complexity of identity formation processes and the multiple influences on identity development. While normative processes of cognitive development can influence how children perceive and make meaning of their daily experiences in terms of differences in race and varied indicators of social class, other external factors, such as racial socialization by parents, serve a protective function and mitigate the potentially detrimental effects of negative racial stereotypes on identity development.

More recent studies using similar methods to assess children’s awareness of negative stereotypes and color connotations have yielded similar findings. Yet, if the differences in interpretations asserted by the Clarks and Spencer are any indication, such findings must be inter-
Child Labor

interpreted within the specific social and historical contexts in which they are conducted. That is, in addition to cognitive developmental status, current social norms and socialization experiences must also be taken into account.

CHANGING METHODOLOGIES IN THE STUDY OF CHILD DEVELOPMENT

Given the diverse theories of development, there are different methodologies for determining the existing and emergent abilities of children and young people (e.g., the Strange Situation, mirror studies, puppet interviews, habituation studies, doll studies, etc). These strategies are based on assumptions about development, the meaning and function of observable behaviors, and similarities among the contexts in which children live and function. Some of these assumptions may be problematic, at best, when considering the experiences of diverse youth of color, immigrants, and youngsters from families that experience intergenerational poverty. As social scientists come up with improved theories, greater cultural competence, and better strategies for studying child behavior, increasingly articulated and nuanced understandings of child development are formulated.

CHILD LABOR

Child labor is work done by persons under age eighteen (or younger, depending on applicable national law) that is harmful to them for being abusive, exploitive, hazardous, or otherwise contrary to their best interests. It is a subset of a larger class of children’s work, some of which may be compatible with children’s best interests (variously expressed as beneficial, benign, or harmless children’s work). Broadly defined, child labor recognizes that childhood is a culturally specific concept and that the particular contexts within which children’s work is assigned and organized tend to determine both its costs and its benefits (Ennew, Myers, and Plateau 2005). While in most cultures some work by children is viewed as healthy for maturation and socialization, child labor is not. It is understood to violate human rights law and policy.

The number of children who are engaged in child labor globally is uncertain. The answer to this question varies according to activity, place, society, and other factors. It is estimated that in 2007 there exist some 250 million child workers worldwide (predominantly in developing countries), with perhaps as many as 75 percent of them working in agriculture and related activities, most of the remainder in the nonagricultural informal sector, and only a small portion in the formal sector. Yet unknown is the exact percentage of these working children who experience child labor specifically.

It nevertheless is widely accepted that large numbers of the world’s working children toil in appalling conditions, are ruthlessly exploited to perform dangerous jobs with little or no pay, and are thus often made to suffer severe physical and emotional abuse—in brick factories, carpet-weaving centers, fishing platforms, leather tanning shops, mines, and other hazardous places, often as cogs in the global economy; in domestic service, vulnerable to sexual and other indignities that escape public scrutiny and accountability; on the streets as prostitutes, forced to trade in sex against their will; and as soldiers in life-threatening conflict situations. Working long hours, often beaten or otherwise abused, and commonly trafficked from one country to another, their health is severely threatened, their very lives endangered. Many, if they survive, are deformed and disabled before they can mature physically, mentally, or emotionally. Typically, they are
unable to obtain the education that can liberate and improve their lives, a condition that is deemed generally to constitute child abuse in and of itself (Bissell 2005; Bissell and Shiefelbein 2003).

The causes of child labor, while steeped in culture, are linked to economics—primarily poverty, necessitating that children contribute to family income. Likewise, the reduction and eradication of child labor is tied fundamentally to economics. In North America and western Europe, for example, major economically based trends (e.g., industrial development, higher wages, technological innovation, more accessible and prolonged education, lower birth rates, the entry of women into the workforce) best explain, along with state regulation and changing popular ideas about childhood, most of the long-term declines in child labor. Labor movements and other forms of social action also have played an important role, shaping public perceptions and values about children and child rearing.

Because of this variety and complexity, economists and other experts point out that effective policies to combat child labor require flexibility to accommodate the many and diverse factors involved in its reduction and eradication. They especially emphasize the critical importance of presenting poor families and children with economic opportunities and incentives that can free them from having to rely on child labor for survival (Basu 1999; Basu and Tzannatos 2003; Anker 2000, 2001; Grootaert and Patrinos 1999).

Human rights discourse and activism—especially since the 1989 United Nations Convention on the Rights of the Child—have likewise become influential in combating child labor, advancing the case for at least minimal standards of socioeconomic and political justice to hasten its elimination. Increasingly child labor is understood to be a multidimensional human rights problem in violation of a broad panoply of entitlements with which all members of the human family are endowed (Weston and Teeink 2005a, 2005b). The Convention on the Rights of the Child ensures that children specifically, including working children, are not overlooked in this regard. Thus does Article 3(1) stipulate that “in all actions concerning children … the best interests of the child shall be a primary consideration”; and thus, to this end, does Article 32(1) recognize “the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child’s education, or to be harmful to the child’s health or physical, mental, spiritual, moral, or social development.”

While poverty and other economic factors will continue as driving forces behind child labor, a human rights approach to the individual child and society—holistic and multifaceted—is indispensable to holding the world community and its member states accountable in eradicating the phenomenon (Weston and Teeink 2005a, 2005b). Recognizing child labor as a human rights problem signals that notions of human dignity are central to all aspects of a working child’s life and to the means by which child labor is reduced or eliminated. In this setting, states, multilateral international organizations, nongovernmental organizations, and business enterprises are expected to act affirmatively to guarantee that children’s rights are not violated within either the work in which they are engaged or the means by which that work is controlled. In addition, children must be informed of their rights so as to be able to engage their full participation in the realization of their rights. To assert a right of a child to be free from abusive, exploitative, and hazardous work bespeaks duty, not optional—often capricious—benevolence.

CHILDLESSNESS

The term childlessness refers to a lifetime of being childless and can be applied both to couples that have never borne a child and to single women or men. Most research, and hence most available data, focuses on women. In some populations the proportion of women experiencing childlessness has been as low as 2 or 3 percent, and in others it has been ten times this minimum level. In the twentieth-century United States, for instance, the level of childlessness for women born in the first decade of the century (and bearing children during the depression of the 1930s) and for those born in the 1950s (and bearing children during the century’s last three decades) was approximately 20 percent. By contrast, it was approximately 10 percent for U.S. women born in the 1930s (and bearing children during the baby boom of the 1950s).

There are four dominant paths to childlessness. First, persons can decide at a young age that they want no children and maintain this position over their lifetimes. Second, persons can intend to have children but postpone childbearing to an age when they are unable to have children, because of subfecundity or infecundity (i.e., limited ability or inability, for biological reasons, to conceive and carry a birth to term). Third, persons who desire and expect children but who are willing to have them only if they are married or in a stable union may become childless as a result of failing to establish such unions. Finally, persons can be unable to bear children due to infecundity present from a young age. The prevalence of each of these reasons for childlessness varies across time and place. In the United States and Europe in the early twenty-first century, the second and third reasons are most prevalent.

There have been many attempts to distinguish voluntary from involuntary childlessness, but this distinction is problematic. Voluntariness is ascribed to those who deliberately choose childlessness and involuntariness to those who are infecund due to congenital abnormalities, malnutrition, or disease. Note that only the first and fourth pathways described above neatly conform to this distinction. The second pathway (postponement followed by infecundity) combines a period of voluntary childlessness with an involuntary period. The third pathway (childlessness due to non-marriage) is in some sense involuntary but is due to a social constraint (the pressure to establish an appropriate union) rather than something biological.

Subfecundity and infecundity, both major contributors to childlessness, have two sources. First, reduced fecundity can occur at any age due to a large number of diseases. For instance, many sexually transmitted infections can lead to pelvic inflammatory disease that results in scarring of the fallopian tubes, thus inhibiting the release of ovum in females. This particular problem may be solved by assisted reproductive technology (ART), which encompasses techniques such as in vitro fertilization. In the United States in 2005, 1 percent of all births resulted from in vitro fertilization. The second cause of infertility is senescence-related (i.e., due to aging). From the time women are in their mid- to late twenties, fecundity declines at an increasing rate with increasing age. ART can overcome some of these senescence-related problems, but technologies still cannot overcome many of them.

Childless adults face a stigma, although its degree varies by time and place. Stigma is greatest in contexts where there are few or no life-course alternatives to marriage and parenthood. In these contexts being unmarried or childless places one outside acceptable adult statuses. The consequences for women are often more severe than for men. Childlessness can lead the husband to take another wife or can provide justification for divorce or abandonment of the wife. In the late twentieth century many societies experienced feminist social movements and assertions that parenthood and childlessness are equally legitimate lifestyle choices. While childbirth is the dominant pathway to parenthood, the permanently childless may become parents through adoption. Like childless adults, adopted children face a stigma that varies across time and place.

CHILDREN
Although seemingly intuitive, the meaning of the term children depends on the context. From a strict biological perspective, the term children refers to the offspring of a male and female who have mated. However, the term need not refer only to biological offspring, as it also applies to socially defined categories of children including stepchildren, adopted children, and foster children. By law, one is considered a minor until the age of eighteen. However, the law distinguishes children from minors in general. According to the law, a child under the age of fourteen is a "child of tender age." The term juvenile is used to categorize individuals between fourteen and seventeen years of age, thus distinguishing juveniles from children.

The United Nations' Convention on the Rights of the Child (1989) sets forth the universal human rights of children: "the right to survival; the right to develop to the fullest; the right to protection from harmful influences, abuse and exploitation; and the right to participate fully in family, cultural and social life.” The four core principles of the convention are: “non-discrimination; devotion to the best interests of the child; the right to life, survival and development; and the right to participation.”

Although these meanings are valid, the meaning of the term children extends beyond the concrete terms imposed by legal and biological reality. From a developmental standpoint, the term can be used to describe individuals from infancy through preadolescence (before puberty), thus including the following periods of human development: infancy, early childhood, and middle childhood. Children undergo significant biological, cognitive, and social changes during each of these stages.

Growth during infancy is characterized by rapid changes in height and weight. Children are born with reflexes such as those that enable them to suck and turn their heads. They are also sensitive and responsive to the facial features and vocalizations of others, particularly their primary caregivers. By twelve to eighteen months of age, children are able to share attention between a person and an object, known as “joint attention,” and they use words and gestures such as pointing to communicate. Children also transition through the stages of locomotion, from crawling to independent upright walking and their early fine motor skills develop. Social interactions initially emerge in dyadic turn-taking bouts between caregiver and child and features of temperament (personality) also emerge. By age two, children are able to recognize their reflections (self) in a mirror, combine words to communicate, search for hidden objects, and manipulate objects during play. Early experiences in infancy set the stage for children's later growth and development. Developmental outcomes during this period are strongly influenced by both nature (genetic influences) and nurture (environmental influences) and risk susceptibility.

Ages two to five mark the early childhood/preschool age period of children's development. By age three, although children's body weight is only 20 percent of its adult size, children's brain size is 80 percent of its adult size. By age five, children's lexicon contains approximately 5,000 to 10,000 words and the syntactic complexity of their language increases significantly. Further developments in children's self-concept and increased narrative skills facilitate children's ability to form and share information about past events (autobiographical memory). Problem-solving skills involving planning and the use of strategies also emerge. Between ages three and five, children's ability to distinguish their thoughts and beliefs from others, known as "theory of mind," develops. Young children's egocentrism affects their view of the world, themselves, and others and is reflected in their inability to effectively coordinate their actions with their peers in play contexts. Play during the early childhood years is "parallel" in nature, defined as two or more children engaged in related activities in close physical proximity to each other. Although parents actively structure and facilitate the social lives and experiences of their children during this period, peers also serve as influential forces.

The hallmark of the middle childhood period is the transition to formal schooling. Although many children attend daycare and/or preschool during the early childhood period, the first day of school marks a cultural passage around the world. Children's physical growth is slow, yet consistent during this period. Between ages five and seven, children's thought shifts from egocentric to concrete operational thought—children are now capable of abstract thinking and understanding and interpreting the thoughts and beliefs of others. Executive functioning capacities, including their conscious ability to control and inhibit their actions, as well as problem-solving, reasoning, working memory, and attention further develop. The peer group becomes increasingly important, as children spend more than 40 percent of their day with peers. Children are labeled by their peers; categories such as
"popular" and "rejected" emerge, as well as the consequences of such social status labels. The development of the self-concept in relation to self-esteem and self-competence as well as moral understanding and beliefs also play integral roles during this period. From a developmental perspective, childhood ends with the onset of puberty.

In addition to legal, biological, social, and developmental definitions of children, one must also consider the impact of the sociohistorical and sociocultural context in which children develop. Children learn by actively participating in cultural activities that promote their growth. Opportunities to learn are embedded in activities at play, school, and work contexts. However, the opportunities afforded to children vary as a function of their cultural upbringing, including the social and economic status of their community and the belief systems regarding their participation in cultural activities.

Children are the product of complex interactions between their genes and the environments in which their development is nested, including, but not limited to, family, school, and community contexts, and the broader cultural belief systems espoused by their nation. Children's experiences and outcomes set the stage for their future development and adjustment in the next stages of human development: adolescence and adulthood.

**CHILDREN’S RIGHTS**

Children's rights involve a double claim. First, they reaffirm children as full members of the human family and assert that children have an equal right to the protection of their fundamental human rights without discrimination based on age. Second, children's rights acknowledge children's developing capacity as well as their vulnerability and encompass additional, special rights for children.

The concept of children's rights has gradually evolved and has not always included both equal and special human rights. Children's rights emerged at the end of the nineteenth century in the context of uncontrolled industrialization and its dire consequences for the living conditions of poor working-class children. The child protection movement considered it a moral duty to alleviate the plight of vulnerable children, who were seen as passive victims and mere objects of intervention. These concerns gave rise to the development of child protection legislation and policies regarding child labor, compulsory education, and juvenile justice, and also led to the adoption of the 1924 *Declaration of the Rights of the Child* (Geneva Declaration) containing a list of protections that ought to be granted to children.

With the advent and development of the welfare state, throughout the twentieth century, children's rights became increasingly framed within social welfare discourse. In addition to protection against all forms of neglect, cruelty, and exploitation, children's rights now also included the right to special provisions, such as education, health care, family support, and social welfare services. This welfarist view is reflected in the 1959 *United Nations Declaration of the Rights of the Child*, which builds upon children's dependency on both their family and the state. During the 1970s, in step with other civil rights and anti-authoritarian emancipation movements, the children's liberation movement began to challenge the exclusive attention being paid to children's protection and welfare rights. The movement argued in favor of children's right to autonomy, including the right to freedom of speech, freedom of assembly, and due process guarantees in judicial proceedings. The child liberationist's claim for children's equal rights was directed against both family and state, whose paternalistic approaches to children were viewed as an impediment to young people's pursuit of autonomy and full participation in society.

The protectionist, welfarist, and liberationist approaches to children's rights converged in the 1989 *United Nations Convention on the Rights of the Child*, a legally binding international instrument that has been ratified by all UN member states, except for Somalia and the United States. This convention contains a broad range of rights, including civil and political rights as well as social, economic, and cultural rights, and can be summarized by the so-called “three Ps,” which include protection rights (e.g., against violence or exploitation), provision rights (e.g., education or health care provisions), and participation rights (e.g., freedom of expression or right to information). The convention's core message is that children are no longer to be seen as mere passive objects of inter-
Children therefore have the right, in accordance with their evolving capacities, to actively take part in shaping their own lives and environments. Since its adoption, various interest groups have made intensive use of the convention as an advocacy tool in a vast array of fields directly and indirectly relating to children’s lives and promoting both children’s equal and special rights.

CHINESE AMERICANS
Chinese Americans can trace their roots to the mid-nineteenth century. Although it is not known when the first Chinese ventured into North America, Harry H. L. Kitano and Roger Daniels (2001) suggest that the first major wave of Chinese immigration to the United States occurred just before the California gold rush of 1849. Although Chinese Americans do not have the long history of African Americans and Latino Americans, they are also not a new immigrant group. Rather, Chinese Americans are a well-established U.S. ethnic group that has faced long-standing social, political, and economic discrimination as well as outright government exclusion (e.g., via immigration laws and policies). Chinese people immigrated to the United States during a variety of periods, and they differed demographically from one another: some were professional elites, while others were cheap labor. Initially most were men.

HISTORY OF CHINESE IMMIGRATION TO THE UNITED STATES
The United States has a long history of immigration and naturalization laws and policies that excluded Chinese from entering the country. In the mid- to late nineteenth century there were no formal policies to prevent immigrants from coming to the United States. As a result Chinese laborers, fleeing from what Sucheng Chan (1991) refers to as a time of natural disasters and extreme political turmoil in China, sought work in the United States, a place that many Chinese believed offered unlimited wealth, resources, and opportunities for success. Unlike other minority groups, such as Africans, who were forced to come to America against their wills, most Chinese immigrants were sojourners who intended to work in the United States for a short time and eventually return to their homes in China. However, similar to other racial minorities in the United States, Chinese workers were relegated to second-class citizenship and often treated as inferior or subhuman compared to whites. Large numbers of Chinese laborers were coerced and even physically forced to work on plantations, in mines, and on the railroads. When their labor was no longer needed, exclusionary immigration laws based on race and nationality were instituted, preventing new Chinese workers from entering the United States. The Chinese Exclusion Act, passed in 1882, prevented Chinese laborers from immigrating to the United States for ten years and prohibited naturalization. In 1888 the Scott Act barred all Chinese laborers legally residing in America reentry into the United States after visiting China. The Geary Act (1892) extended the Chinese Exclusion Act for another ten years. Chinese laborers were barred from entering the United States indefinitely in 1902. In 1917 the U.S. Congress prohibited the entry of natives from China, South and Southeast Asia, Afghanistan, and parts of what is now known as the Middle East.

The anti-immigration movement of the early twentieth century was coupled with violence and racism against all Asian immigrants but in particular the Chinese. The anti-immigrant sentiments prevalent during this time were based on numerous fears, particularly a fear of “foreignness,” or the idea of difference, usually based on ethnocentric notions of biological and cultural inferiority. White Americans also feared that immigrants would take their jobs, jobs that in many instances were not sought by whites.

In 1943 the Chinese Exclusion Act of 1882 was repealed, and a quota of 105 Chinese immigrants per year was established. The War Brides Act of 1945 allowed veterans of World War II (1939–1945) to bring their foreign-born wives and children to the United States, increasing the number of Chinese women who were allowed to immigrate to the United States. Until then the Page Act of 1875, implemented in an effort to reduce the number of Asian prostitutes in the United States, limited the immigration attempts of most Chinese women. The McCarran-Walter Immigration and Nationality Act of 1952 eliminated racial and ethnic restrictions from the country’s immigration and naturalization policies and opened the door for many Chinese women wanting to immigrate to the United States. Likewise the Immigration and Naturalization Act of 1965 removed quotas for immigrants from the Eastern Hemisphere, resulting in high lev-
els of immigration from China, Japan, and various Southeast Asian countries. The new immigration guidelines allowed 170,000 immigrants from the Eastern Hemisphere to enter the United States, with no more than 20,000 per country, along with 120,000 immigrants from the Western Hemisphere. The law also prioritized reunification of families and made it easier for Chinese immigrants to become naturalized. Additionally children of immigrants were granted citizenship, a privilege that was typically denied in the past.

As a result of the Immigration and Naturalization Act of 1965, the rate of immigration to the United States increased, and the nature of immigration changed as more people of color were allowed entry to the United States, creating a substantial shift in the racial and ethnic composition of the population. The number of Chinese immigrants and Chinese Americans in the United States increased from around 125,000 in the early 1900s to well over 1.6 million by 1990.

CHINESE AMERICANS AND THE MODEL MINORITY MYTH

Some researchers argue that American-born Chinese began to outnumber immigrants from China residing in the United States starting in the 1940s, and that trend has continued into the twenty-first century. Chinese Americans are not a monolithic group but rather a diverse population. Some have enjoyed the economic success that comes with higher education and a professional career, but many Chinese Americans are low-skilled laborers with little education and low socioeconomic status. Stereotypes of Chinese Americans often misrepresent their experiences, and according to Frank Wu (2002), racial prejudice and discrimination directed at Chinese Americans often result from such stereotypes. For example, the model minority myth, which arose in the mid-1960s, holds that the success of Asian Americans, including Chinese Americans, is due to their hard work and diligence, ignoring race, class, and reasons for migration can influence the experiences of different immigrant groups.

The model minority myth also exacerbates conflict between Asian Americans and other U.S. minority groups by setting Asian Americans on a pedestal as a “model” group that has “made it” because of dedication and a positive work ethic that other minority groups may lack. Furthermore the model minority myth ignores the fact that many Chinese Americans are not highly educated professionals but are low-skilled laborers who do not experience economic success. Thus the model minority myth obscures the contextual situation of each immigrant group. Chinese immigrants who migrated shortly after the Immigration Act of 1965, for example, were predominantly educated professionals, giving them and their children an economic advantage that many earlier Chinese immigrants lacked.

The model minority myth deflects attention from racist structural factors that have impeded the success of many immigrants and people of color in the United States. It promotes the ideology of individuality as a way to achieve success in America and ignores the barriers (such as racist immigration laws and policies) facing many immigrant groups and their children in achieving success.

CHINESE AMERICANS AND CITIZENSHIP

Although Chinese Americans have fared better in the United States than some other Asian groups (e.g., Filipinos, Vietnamese, Hmong), they have been far from immune to the effects of racism. Numerous studies have documented incidents of overt racism experienced by Chinese Americans, ranging from verbal insults and differential treatment to hate crimes and violence. The murder of Vincent Chin, a young Chinese American man, exemplifies the type of racially motivated violence that Asian Americans may experience. Chin was severely beaten on June 19, 1982, outside a bar in Detroit. He died four days later, five days before his wedding. The perpetrators, two out-of-work autoworkers, claimed they had mistaken Chin for Japanese, a group they blamed for problems within Detroit’s automobile industry.

Chinese Americans have also had their citizenship questioned. Citizenship was once legally denied to both Chinese immigrants and their American-born descendants because of their race. In the early twenty-first century, although Chinese Americans are legal citizens, they are often not culturally viewed as citizens because they are not white. Scholars argue that racialized ethnics, such as Chinese Americans, are often assumed to be foreign rather than American. Mia Tuan’s 1998 study of the Asian Americans’ experience revealed that many Asian Americans, including Chinese Americans, are often asked where they are from. When “America” is the response, most whites, unsatisfied that Asians can be Americans, will continue by asking, “no, where are you really from.” Thus as Frank Wu (2002) pointed out, Asian Americans are seen as “perpetual foreigners” in the United States. The perpetual foreigner syndrome was evident in some media coverage of the 1998 Winter Olympics. During the figure skating competition, Michelle Kwan, a Chinese American skater, lost the gold medal to Tara Lipinski, a white American. A subsequent MSNBC headline read, “American Beats Out Kwan,” suggesting that Kwan was not as American as Lipinski. Four years later, in the Seattle Times, a similar headline appeared when Kwan lost to another white American, Sarah Hughes, in the 2002 winter Olympics: “Hughes Good as Gold: American
Outshines Kwan, Slutskaya in Skating Surprise." Both headlines are examples of how a sense of belonging, a privilege associated with citizenship, is denied to Chinese Americans because of their race and how racialized ethnicities are not able to fully assimilate into the mainstream.

While Chinese cultural centers and Chinatowns reflect one of the many impacts Chinese Americans have had on American culture, Chinese American laborers represent another major contribution to American culture and history. In 1869 the Union Pacific Railroad and the Eastern Pacific Railroad were joined together by the Transcontinental Railroad, connecting the eastern part of the United States to the western. Chinese laborers provided a substantial number of workers to complete the project and were paid less than their white counterparts. The completion of this railroad aided in the economic development of the western part of the United States. Thus while Chinese American laborers have historically been exploited financially and faced racial discrimination, they were integral in the economic development of the United States through their hard work on the railroads.

Chinese Americans have lived in the United States for more than a century, but their history has been plagued with racism. Racist immigration and naturalization laws and policies excluded Chinese from migrating to the United States and denied them rights and privileges associated with citizenship. Although these laws and policies have been dismantled, Chinese Americans still face stereotypes, such as the model minority myth, that minimize the breadth of their experiences. The history of Chinese immigrants provides a contextual framework with which to understand the situation of Chinese Americans.

Chinese Diaspora

Diaspora is a Greek term, meaning the widespread scattering of seeds. Its biblical use refers to the dispersal of the Jews around the Roman Empire. Until the 1990s it was rarely found in the social sciences, and is also absent from previous editions of this Encyclopedia and from the 1994 Dictionary of Sociology. The international distribution of middlemen minorities during premodern times was long considered of only historical interest, with little relevance to the modern world of capitalist corporations and nation-state societies. Members of various diasporas were conceptualized as ethnic groups, minorities, and immigrant communities, with a focus on their place within individual host societies, rather than on their transnational connections.

Only in the last decades of the twentieth century, with increasing globalization, did the need for a collective term become apparent. Daniel Chirot and Anthony Reid proposed the term essential outsiders; Joel Kotkin used global tribes. Neither term caught on, however. Khachig Tololyan launched the journal Diaspora, in December 1991, with the claim that transnational diasporas were “the exemplary communities of the trans-national moment,” and new diaspora studies (of Africans, Chechens, Indians, Irish, Italians, Palestinians, and Filipinos) have multiplied.

Diaspora is a collective noun, referring to people who have (themselves or their ancestors) been scattered from a place of origin, and to elements of their common identity and culture. If a diaspora is only constituted by shared memories and common attributes, these are likely, with the passage of generations, to fade through assimilation. Long-term survival for diasporic communities generally depends on continuing transnational communication and flows. Thus, historically, the most tenacious diasporas have often been those interconnected by long-distance trade.

THE CHINESE OUTSIDE
MAINLAND CHINA

China has for over two thousand years been a great power in the East, yet it has nearly always seen itself as a land-based empire, indifferent or hostile to the traders and emigrants who left its shores, fleeing poverty or conflict or seeking economic opportunities. Chinese have been important traders around the South China Sea since before the twelfth century. They were predominant middlemen in precolonial and colonial times in Southeast Asia and Vietnam, and served as intermediaries between local producers and colonizers. Like other such groups, they suffered periodic persecutions and expulsions. Chinese trading communities around the region and the world thus largely established themselves and their transnational relations with each other as self-regulating entities, with limited state support or protection and with their own associations and welfare provision.

Wang Gungwu (in China and the Chinese Overseas, 1991) argues that these Chinese established a peripheral capitalism, on the fringes or outside the reach of the imperial (and later the Communist) state. Only here was Chinese merchant culture able to flourish, away from a repressive and contemptuous mandarinate, whose Confucianism emphasized ritual and hierarchy and disapproved of trade, risk, and profit. Wang describes how the Chinese overseas created their own distinctive institutions, by reshaping and developing the traditions they had brought with them and combining them with influences from the lands where they settled and the local women they married. These traditions included the Taoist and Zen Buddhist beliefs common in southern China, the sophisticated monetary and lending practices of Chinese peasants, and a facility in forming cooperative organizations. Another resource, described by Gary Hamilton (in Business Networks and Economic Development in East and Southeast Asia, 1991), was the experience some brought of imperial China’s urban guilds, which had set their own standards for weights and measures and had enforced contracts without relying (as had the guilds of medieval Europe) on state enforcement.

Most diasporic Chinese came from the outer parts of the empire, from its southern coastal provinces of Guangdong and Fujian, where state control was looser, or via treaty ports or the ceded territories of Hong Kong or Macao. One concentration of emigrants from the mainland was based in Taiwan, which was only attached to China late and insecurely. Settled from China from the sixteenth century—often by merchants and pirates from Fujian, who were seeking a base for maritime activities, and by rebels against the Manchu dynasty—Taiwan only came under central control after 1684, and was always lightly administered and notoriously lawless thereafter. From 1895 until 1945 it was a colony of Japan and after 1949 it was ruled by Kuomintang exiles from the Communist mainland.

In time, many diasporic Chinese assimilated completely, yet continuity was assured by new waves of emigrants, who worked for, learnt from, and then replaced their predecessors. In Chinese business culture today there are some direct continuities with features of merchant culture and institutions in the China of five hundred years ago. Yet most of the members of modern diasporic communities can trace their own family’s origins to villages in China left at most only a couple of generations ago. For a majority in Southeast Asia, the migration of their family occurred in the period preceding the last world war. For most in Hong Kong it is even more recent—until 1981 those born in China were a majority. Thus a persisting feature of these often-ancient communities is their intense social mobility and constant self-rejuvenation.

In the mid-nineteenth century, gold rushes attracted significant numbers of Chinese to California and Australia, where many remained. By the end of the century, however, restrictions on immigration and widespread discrimination led to a decline in numbers, the demise of associations, and ghettoization within narrow economic niches. Ivan Light, in Ethnic Enterprise in America (1972, p.7), comments that the “classic small businesses of pre-war Chinese were … monuments to the discrimination that had created them.” In contrast, the 1920s saw large-scale movements, including of women, into flourishing Chinese settlements in Southeast Asia.

In the decades after World War II the situation reversed. Postcolonial nationalist or Communist regimes in Southeast Asia and Vietnam restricted, persecuted, or expelled the Chinese in their midst, whereas racially based barriers to entry were lifted in the United States in 1965 and the White Australia policy was terminated in 1973.

Chirot and Reid (1997) explore the analogies between diasporic Chinese in Southeast Asia and Jews, viewing both as “essential,” but periodically scapegoated, “outsiders.” In Malaysia, discriminatory rules favored bumiputras (indigenous Malays) but failed to halt the rise of Chinese business. In Thailand, Chinese de-sinified their names. Many were expelled from Vietnam after the Communist victory. In Indonesia, Chinese cultural expression was banned until recently, and widespread anti-Chinese riots and rapes followed the Asian Crisis and the fall of Suharto in 1998.

In the last decades of the twentieth century, new waves of secondary immigration increasingly moved from Asian countries of settlement to North America and Australia and fresh flows came from Mainland China. Today, at the start of the twenty-first century, Chinese communities are to be found everywhere in the world.
including throughout the Americas and Europe, as well as in Russia. There is, for example, an active Chinese Association in Johannesburg.

**A CHINESE DIASPORA?**

Can the same twenty-five million Chinese outside China (double that number if we include those in Hong Kong and Taiwan), sometimes called the ethnic Chinese or the overseas Chinese or the Chinese overseas, be called a diaspora? The suggestion has been academically controversial, and not only among those who wish to reserve the concept for the Jewish people.

An academic divide long carved up Chinese studies into segments, placing in separate compartments the China specialists, the East Asianists, the Southeast Asianists, and the experts on ethnic Chinese in Western countries. Those who speak of a diaspora have been accused of oversimplifying and blundering into areas beyond their competence. Reality is indeed varied and complex, but these particular divides result from the staking out of academic and political territories, rather than from insurmountable barriers in lived experience. If questions about linkages are not posed, however, the answers are unlikely to obscure our vision because there are also statistical divides, created by the political units for which data are collected and presented. Also a factor are the ideological preferences of those who wished to focus on national loyalties and assimilationist hopes, and to deny any transnational attachment, especially one that might involve a Cold War opponent. To justify the concept of a Chinese diaspora, two arguments need to be made, showing both similarities and interrelationships between and among diasporic communities.

First, it must be demonstrated that despite the multiplicity of national, political, and class loyalties and the diversity of cultural and historical trajectories, there exist significant similarities and elements of a shared identity. Evidence for such commonalities is particularly to be found in studies of the economic activities of Chinese around the world, which demonstrate clearly a strong tendency to establish mainly small family businesses, with important elements of a distinctive and shared business culture and mode of operating.

John T. Omohundro (1981) describes the Chinese of Iloilo in the Philippines in 1970 as a one-class community, without gentry, in which the vast majority were self-employed descendants of penniless immigrants. In this community, young employees saw themselves as the rich businessmen of the future and old employees were seen as ex-apprentices who had bungled their chances. The status of women and junior members within the family rose as the family business grew and their role within it expanded. Similar accounts from many other times and places (including America and Australia) demonstrate how both opportunities (including their own effective business traditions and skills) and legal and discriminatory barriers (which often excluded them from agriculture and the military, and from managerial and bureaucratic positions in the state or big business) pushed every person with any ambition into self-employment.

Even education was more likely to lead back into business, or at least into an independent profession, than into high-status employment. Within the Chinese business community, managerial and bureaucratic positions were rare and these tended to be subject to owners’ mistrust, while access to top positions was reserved for family members. Independent business activities have provided the predominant role model, the community leadership, and often the most common activity for mature adults in diaspora communities.

In most Chinese diasporic communities, one of the central and continuing attributes of business is a persistence of family control over entrepreneurial decision-making, even in the largest companies, where professional management and public flotation may be well-established. The tendency, with a few noteworthy exceptions, has been toward a multiplication of relatively small units in a conglomerate structure under the family’s control, rather than the expansion of size and market share of large bureaucratically organized firms. This too has reduced the visibility of the concentrations of capital involved. Western and Japanese systems of capitalism have tended to present a duality of large corporations and small and medium firms, with major differences between them and limited opportunities to move back and forth. In Chinese capitalism, many features are common to both large and small operators, leading to greater similarities and continuities and opportunities for mobility up and down. Small firms, with large entrepreneurial ambitions and transnational networks, and with a leading role for highly educated family members, can grow fast by multiplication. Tycoons may own hundreds of such small firms and retain the personalistic style of small operators; they may also be weakened or have their wealth split up if key managers leave to set up independently or if inheritance is divided.

In their external relations (with lenders, borrowers, suppliers, customers, contractors, and subcontractors), Chinese capitalists tend to minimize reliance on legal protection. Chinese capitalism is distinguished by a preference for long-term, personalized, but opportunistically extensible networks, based on trust and upheld by the indispensability of reputation.

Another feature, at least in recent times, has been a preference for a strategy of diversification, in the interests of maximizing flexibility, not “putting all your eggs in one basket,” and taking advantage of novel and unpredictable
opportunities that open-ended networks may present. This allows individual family members to carve out a territory of their own, promoting harmony, and is facilitated by the freedom of owner-managers to make rapid decisions.

The temporary usefulness of this Chinese business culture was rarely contested. It used to be claimed, however, that these distinctive features were transitional, doomed to decline as they adjusted to modernity and the mainstream or were driven out by competition with modern capitalism. By the 1980s, however, "modernity" itself had been changed by processes of globalization, including cheap and rapid communications, growth in the flows of people, goods, money, and information, the spread of deregulation, the opening of the frontiers of previously largely autarkic Communist regimes, the weakening of economic control by national governments, increasing worldwide subcontracting, and direct foreign investment in globally integrated production. The balance of advantage shifted to the flexible, entrepreneurial businesses of the diaspora, whose previously largely redundant transnational "sleeper" networks now sprang into life.

THE CHINESE DIASPORA IN THE ERA OF GLOBALIZATION

The second requirement for justifying the term diaspora is to show that the similarities between separate communities create the conditions for actual transnational linkages and interrelationship. Through much of the twentieth century, such linkages and interrelationships were at best incipient and potential, blocked as they were through a long period of nationalism and stagnant world trade. Only in the last decades of the century, in the period of globalization, have constant and increasing transnational diasporic activities and movements across various divides become apparent. Experts within particular fields of Chinese studies have tended, however, to be blind to these newly growing linkages, constructed by the movement of goods and capital and by people (business people, refugees, students, visitors) investing and trading, remigrating, or returning to their place of origin, all weaving far-flung networks of kinship and friendship. Widely noticed or not, such linkages and the similarities that facilitate them are likely to persist, insofar as they are an asset in an age of globalization.

From the 1980s, locally initiated and funded manufacturing, finance, and markets were developing faster within East and Southeast Asia, along with a progressive integration of regional trade and investment flows. The previously discrete Chinese trading or manufacturing communities around the region now had the motive and opportunity to start diversifying, upgrading, and linking up, using their transnational networks to benefit from and contribute to the export-led economic growth of the region.

The volume of trade of the countries in which Chinese diaspora networks were active (including China, Hong Kong, and Taiwan and the countries of Southeast Asia—the Philippines, Indonesia, Singapore, Thailand, Malaysia, and Vietnam) grew slowly between 1980 and 1985 and then more than doubled by 1990. By 1996 it had increased by another 126 percent, over a period during which total world trade increased by only 56 percent. Intraregional trade, between these countries, increased even faster, up by nearly 160 percent from 1990 to 1996. All parts of the region experienced accelerated growth. Trade between the two great Chinese entrepôts of Hong Kong and Singapore (including the re-exports they channeled in both directions between China and Southeast Asia) increased at rates similar to those of intraregional trade as a whole.

In the 1990s the countries in which diasporic Chinese were prominent economic actors emerged as major international investors. Already by the late 1980s their combined outward investments were jointly on a par with those of Japan. After 1991, as Japan substantially reduced its global foreign investment, they clearly overtook her. By 1996 these countries provided around 14 percent of total world flows of realized foreign direct investment, most of it directed to the countries of their own region. There can be no doubt that most of this investment came from Chinese diaspora sources within these countries. In contrast, Japan was by then providing only about half that proportion of the world total, most of its directed outside the region.

Turn-of-the-century studies of Chinese ethnic business concentrations in America and Australia—in California, Vancouver, and Brisbane, for example—have also found a trend for traders and investors to start using their transnational networks to develop a role as bridges to Asia, adding their weight to the diaspora’s global flows.

The most significant opportunity for the diaspora, both the small businesses and the tycoons, was the economic opening of, first, China’s Pearl River Delta after 1985, and then of all of the coastal provinces (from which most in the diaspora had originated) and the rest of the country. Diasporic Chinese were responsible for some 80 percent of the massive foreign investment in China up to the end of the twentieth century and were still accounting for over 50 percent in the middle of the first decade of the twenty-first. They served as a bridge between China and the world economy, helping to transform China into one of the great exporting nations of the world, and a rising economic superpower. Their role, and the crucial importance of the transnational networks that made it possible, is documented in some detail in Lever-Tracy et al (1996).
CONCLUSION
Before the turn of the century, the multiplication of successful contacts with other parts of the diaspora and with the mainland was promoting re-sinification. Children were now often encouraged to learn Chinese, new Chinese associations proliferated, and dormant Chinese identities and knowledge were resurfacing. Economic success has bred a new ethnic pride and a cultural flowering, and diasporic Chinese are now even able to influence the Chinese government.

CHINESE REVOLUTION
The term Chinese Revolution refers to a series of great political upheavals in China between 1911 and 1949 that brought the classical, Confucian, imperial era to an end and eventually led to Communist rule and the establishment of the People’s Republic of China. The first phase of the Chinese Revolution started with the republican revolution of 1911, which came about as a result of growing social unrest, the disruptive and humiliating presence of Western and Japanese troops on Chinese soil, and the inability of the imperial government to launch the process of China’s belated modernization or even to defend national sovereignty and dignity. The Manchu-descended Qing dynasty (1644–1912) was easily overthrown by a popular rebellion led by nationalist leader Sun Yat-sen (1866–1925), his National People’s Party (Guomindang), and other revolutionary groups. The last Qing monarch, child emperor Pu Yi (1906–1967), was forced to abdicate on February 12, 1912. A republic was proclaimed under the provisional Nanjing Constitution of 1912, which was supposed to translate into practice Sun Yat-sen’s three principles for the revolution: democracy, nationalism, and socialism.

A republican government headed by General Yuan Shikai (1859–1916), the military leader of the most powerful revolutionary faction, was established in the ancient capital, Beijing. In spite of his greater popularity, Sun Yat-sen, who briefly became nominal president in 1913, had to step aside in Yuan’s favor in order to avoid a civil war. Having initially committed himself to a constitutional order in China, General Yuan proved to be more interested in imposing a centralized personal dictatorship. He suspended the republican constitution, dispersed the fledgling national assembly in Nanjing, proclaimed himself president for life, and even tried to bring back the abolished monarchy with himself as emperor. Yuan Shikai was deposed in 1916 and replaced by another military warlord in Beijing. This political crisis only deepened the power vacuum in Chinese politics, which persisted until the ultimate triumph in 1949 of Communist leader Mao Zedong (1893–1976).

The Paris Peace Conference of 1919 after World War I (1914–1918) sparked great nationalist turmoil in the young Chinese Republic. Having participated in the war on the side of the victorious Entente allies, the Chinese hoped to see an end to the imposed and unequal foreign treaties under which China had been coerced to grant
**Chinese Revolution**

Western powers and Japan “extraterritorial” rule over the main Chinese seaports, as well as unfair and predatory trade privileges. They felt betrayed when the so-called treaty port system was left in place, frustrating Chinese hopes for territorial integrity and national self-determination. To add insult to injury, defeated Germany’s land “concessions” in China were turned over to Japan as a result of a secret treaty signed in 1917 by Britain, France, and the warlord government in Beijing. The ensuing sense of national outrage and betrayal ignited a storm of popular unrest in Beijing, in which angry Chinese from all walks of life participated in a student-led demonstration held at the famous Tiananmen Square on May 4, 1919. The Tiananmen protesters were later joined by many other patriotic-minded Chinese in a nationwide wave of demonstrations, marches, strikes, and boycotts of Japanese goods that became known as the “May Fourth movement” and which contributed immensely to the explosive growth and radicalization of Chinese nationalism.

The second phase of the Chinese Revolution was the Nationalist revolution, which began in the early 1920s. By 1923 Sun Yat-sen had formed a military-political alliance with the recently formed Chinese Communist Party (CCP) in an attempt to restore national unity and prevent a civil war. Inspired by the example of Vladimir I. Lenin (1870–1924) and his Bolshevik revolution in Russia, Sun Yat-sen also established close ties with Moscow, receiving Soviet advisers, weapons, military training, and economic assistance. With Soviet help, Sun Yat-sen and his associates set up a Nationalist government in Guangzhou, which modified Sun’s “Three Principles of the People” to stress a more radical, anti-imperialist, and anticapitalist ideological agenda. The Guomindang’s National Liberation Army, led by General Chiang Kai-shek (Jiang Jieshi, 1887–1975), Sun’s brother-in-law, fanned out of Guangzhou to challenge the power of local warlords, who had sprung up across China in the absence of a strong central authority. But Sun’s death in 1925 left the Chinese Republic without a unifying figure, and it soon fell into the internecine conflict and bloodshed that he had feared.

By 1927 Chiang Kai-shek had emerged as the Guomindang’s new leader, trying to extend the authority of the Guangzhou government and meet the serious challenge posed by local warlords and their separatist ambitions, as well as by growing Communist influence throughout the country. In a military effort to reunify China, he and his Communist allies waged a successful military campaign against the powerful northern warlords, overrunning half of China’s provinces and many important cities. But a new civil war broke out when Chiang moved to destroy his alliance with the Communists and also severed most ties with the Soviet Union. Under pressure from wealthier and more conservative members of the Guomindang, he turned on his erstwhile Communist allies, starting with the so-called Shanghai massacre of 1927, in which tens of thousands of Communist Party members were brutally executed by the Nationalists in Shanghai and many other Chinese cities in what came to be known as the Nationalist “White Terror.”

With the Communists temporarily crushed and driven out of the cities, Chiang resumed his northern expedition against the local warlords and their private armies. By 1928 most of China, including Beijing, was finally brought under Nationalist control, thereby ending the period of warlordism (even though some northern warlords continued to defy the central government’s authority until 1937). The new Guomindang government established at Nanjing, however, was weakened by the stubborn opposition of the Communists and especially by imperial Japan’s invasion and occupation of Manchuria in 1931. Even after the Japanese attack, Chiang pressed the fight against the Communists, whom he regarded as the more dangerous enemy. His decision not to fight Japan’s aggression in Manchuria cost him and his party a loss of support among the more nationalistic sectors of Chinese society, who began to view the Communists, rather than the Nationalists, as leading the struggle for national sovereignty and unification.

Chiang launched a series of military offensives that surrounded the Communist troops in southeast China in 1930, but legendary Communist military commander Zhu De (1886–1976) managed to break out of the encirclement and resorted to rural guerrilla warfare to harrass his Nationalist opponents. Zhu De had created a well-trained, disciplined, and highly mobile professional military corps, the Red Army, which was based on the peasantry as the main revolutionary force in a country that was predominantly rural, agrarian, and agricultural. Under constant attack by the numerically superior Guomindang troops, the Communists retreated to the southeastern province of Jiangxi, where they proclaimed the short-lived Chinese Soviet Republic (1931–1933). They introduced radical land reforms, which attracted significant support among the poor peasants. After more Nationalist assaults, the Communists were forced to flee Jiangxi, which led to their famous Long March to escape total rout. The 6,000-mile Long March to the northwest, which took place from October 1934 to October 1935, depleted the Communist ranks from over 100,000 to little more than 20,000 survivors, mainly as a result of skirmishes with the pursuing Guomindang soldiers, as well as the harsh weather and terrain conditions. But it also resulted in the emergence of Mao Zedong as the ablest and most charismatic Communist leader. The exhausted Red Army troops finally settled around Yenan in Shanxi Province, where they remained until 1946.
Chiang Kai-shek ordered the Manchurian units of his army to move against Mao’s weakened forces in 1936, but his plan to finish off the Communists backfired. Determined to liberate their home region from Japanese occupation and encouraged by the Communists, mutinous Manchurian officers arrested Chiang and held him captive for two weeks, demanding an end to the civil war and the formation of a united front against Japan. Their patriotic revolt eventually led to an uneasy alliance between the Guomindang and the Communists to expel the foreign invader. For a while, most of China rallied behind the Guomindang government for an all-out resistance against the Japanese. In 1937 full-scale fighting broke out between the Chinese and the Japanese Imperial Army in the so-called Second Sino-Japanese War, which later merged with World War II (1939–1945). The Japanese armies overran most of eastern China and the main coastal cities, which forced the Guomindang government to relocate its capital far inland to Chongqing, Japan’s brutal occupation and wanton disregard for Chinese lives was symbolized by the infamous “rape of Nanjing,” in which Japanese soldiers pillaged and burned the city, while systematically massacring nearly three hundred thousand men, women, and children. With logistical and air support from the United States and Britain, the Chinese troops—especially the militarily more effective Communist guerrilla units—managed to tie down the bulk of the Japanese Imperial Army inside mainland China. Abandoned by the Guomindang government, millions of poor peasants in eastern China turned away from the Nationalists, relying instead on the Red Army for protection from the Japanese occupation forces. The national mass mobilization in the struggle against Japan only reinforced the existing bonds of unity and cooperation between the peasantry and the Communists that had originated in the years of their Yanan retreat. Animosity between the Nationalists and the Communists persisted, however, as Chiang’s army continued to blockade the areas under Mao’s control.

The last phase of the Chinese Revolution was the Communist revolution, which began with the resumption of the civil war, temporarily interrupted by the Sino-Japanese War of 1937 to 1945, and culminated with Communist Party rule being established throughout China in 1949. While all Chinese had pooled military resources against the Japanese during World War II, open civil war flared up again in 1946, when the Red Army (now renamed the People’s Liberation Army) and the ruling Nationalists resumed fighting each other. Dominated by the conservative landlord class, which was determined to preserve the traditional feudal order, the Guomindang was losing the support of urban-based middle-class professionals and businessmen, who demanded wide-ranging social and economic reforms. Using skillful propaganda and moderating their radical land redistribution program, the Communists mobilized millions of disaffected Chinese, especially in the impoverished countryside. By 1945 the Communist Party had more than 1.2 million members and the People’s Liberation Army numbered about 1 million soldiers ready to fight to the death for the proclaimed Communist ideals of economic equality, social justice, and national independence. With strong support from Moscow, the Communists had acquired the numbers, organizational resources, and military strength necessary to successfully challenge Guomindang rule. Diplomatic efforts, spearheaded by U.S. general George Catlett Marshall (1880–1959), to mediate a negotiated agreement between the warring parties failed to prevent the renewal of all-out conflict.

At first the strategic initiative was in the hands of the Nationalists, who were receiving substantial U.S. military and financial assistance. American ships and planes helped transport Chiang’s troops, who captured all principal cities, including Yenan, the coastal areas, and most of northern China, but failed to weaken the Communist stranglehold on the countryside. Communist military leader Zhu De used aggressive guerilla tactics, launching hard-hitting counterattacks against the enemy’s overstretched overland lines of communications and supply. Throughout 1948 the Communist “war of the villages against the cities” proved to be so effective in encircling enemy-held areas and urban centers that the Nationalist troops in Manchuria were completely cut off and had to be resupplied by air. By the end of the year, all of China north of the Yangtze River was under Mao’s control. In 1949 the demoralized Nationalist forces were decisively defeated, compelling Chiang Kai-shek to resign the presidency and seek a negotiated peace with his adversaries. But it was too late for any compromise settlement with the victorious Communists. Meeting only token resistance, the People’s Liberation Army began its final push to capture the remainder of China south of the Yangtze, including the major cities of Nanjing, Guangzhou, and Shanghai. On January 31, Beijing fell to the advancing Communist forces. Following their total defeat, Chiang, his government, and fifty thousand surviving Nationalist soldiers were evacuated to the island of Formosa (now Taiwan), where the Guomindang was the dominant political party into the 1990s. With the civil war finally over, on October 1, 1949, Mao Zedong proclaimed the People’s Republic of China before huge cheering crowds in Beijing’s Tiananmen Square.

CHISHOLM, SHIRLEY
1924–2005

Shirley Anita St. Hill Chisholm, the first black woman elected to the U.S. Congress, was born in Brooklyn, New York, on November 30, 1924. Chisholm graduated from Brooklyn College in 1946 and began her career as an educator. Her belief in the power and necessity of education motivated her to earn her master's degree in early childhood education from Columbia University in New York in 1952 and eventually launched the political career for which she is revered. Working with the New York City Bureau of Child Welfare, along with her involvement in local organizations, Chisholm solidified many of the relationships that led to her election to the New York State Assembly in 1964. Only four years after assuming that position, Chisholm made the transition from state politics to national politics with her election to the U.S. House of Representatives in 1968, becoming the first black woman elected to Congress.

In Congress, Chisholm continued to live up to her campaign slogan of “Unbought and Unbossed.” She routinely spoke against politics and policies that she viewed as unfavorable to the American people. Moreover, Chisholm did not let the exigencies of reelection rule her actions in Congress. She did what she thought was right, proper, and best. This frequently made her unpopular both with her mostly male colleagues and her constituents. As a result, much of Chisholm’s career was spent on the margins. She was conscious of how both her race and gender excluded her from the male dominated social network that ran Congress. Her commitment never waned, despite this opposition, and as a result she was elected to seven terms in the House of Representatives before retiring in 1982. She was also one of the founding members of the Congressional Black Caucus in 1971.

Despite her historical importance as a congresswoman, Chisholm is best known for her run for the U.S. presidency in 1972. Chisholm ran in the Democratic primary against several male contenders, but not to win in a conventional sense. Chisholm felt that her candidacy served primarily a reform function by keeping her male counterparts focused on the issues. Despite her intentions in entering the race, she faced discrimination from the mostly male political establishment. Many felt that Chisholm should have allowed a black man to run for president before a women tried to do so. Furthermore, her presence in the race was unwelcome, as evidenced by the lack of media coverage of her candidacy. Well aware of these dynamics, Chisholm was undaunted and entered the primary. Though she would lose, she was able to make a notable showing in the primary. After her foray into presidential politics, Chisholm returned to the House of Representatives, where she served until 1982. Upon retiring, Chisholm settled into a quiet life with her husband, Arthur Hardwick. In 1991 Chisholm, now a widow, relocated to Florida where she lived until her death in January 2005.

Chisholm’s success came from her commitment to humanistic, people-centered leadership. She wanted to inspire individuals, especially women, to believe in their abilities to effect change in their world. Her goals transcended color as she worked tirelessly for a responsive government that would act for the sake of all people, not for special interests. Though it cost her at times, Chisholm remained faithful to the principles of democracy. She was a reflective leader at a tumultuous time, and this is the legacy her leadership leaves behind.

**Chi-Square**

The term *chi-square* ($\chi^2$) refers to a distribution, a variable that is $\chi^2$-distributed, or a statistical test employing the $\chi^2$ distribution. A $\chi^2$ distribution with $k$ degrees of freedom (df) has mean $k$, variance $2k$, and mode $k - 2$ (if $k > 2$), and is denoted $\chi^2_k$. Much of its usefulness in statistical inference derives from the fact that the sample variance of a normally distributed variable is $\chi^2$-distributed with $df = N - 1$. All $\chi^2$ distributions are asymmetrical, right-skewed, and non-negative. Owing to the broad utility of the $\chi^2$ distribution, tabled $\chi^2$ probability values can be found in virtually every introductory statistics text.

### $\chi^2$ Test for Population Variances

A test of the null hypothesis that $\sigma^2 = \sigma^2_0$ (e.g., $H_0$: $\sigma^2 = 1.8$) is conducted by obtaining the sample variance $s^2$, computing the test statistic

$$G = \frac{(N - 1)s^2}{\sigma^2_0}$$

and consulting values of the $\chi^2_{N-1}$ distribution. For a two-tailed test, $G$ is compared to the critical values associated with the lower and upper $(50 \times \alpha)$% of the $\chi^2_{N-1}$ distribution. Rejection implies, with confidence $1 - \alpha$, that the sample is not drawn from a normally distributed population with variance $\sigma^2_0$.

### $\chi^2$ Tests of Goodness of Fit and Independence

The $\chi^2$ goodness of fit test compares two finite frequency distributions—one a set of observed frequency counts in $C$ categories, the other a set of counts expected on the basis of theory or chance. The statistic

$$G = \sum_{i=1}^c \frac{(O_i - E_i)^2}{E_i}$$

is computed, where $O_i$ and $E_i$ are, respectively, the observed and expected frequencies for category $i$ given a fixed total sample size $N$. $G$ is approximately $\chi^2$-distributed with $df = C - 1$. If the null hypothesis of equality is rejected, the test implies a statistically significant departure from expectations.

This test can be extended to test the null hypothesis that several frequency distributions are independent. For example, given a $3 \times 4$ contingency table of frequencies, where $R = 3$ rows (conditions) and $C = 4$ columns (categories), $G$ may be computed as

$$G = \sum_{i=1}^R \sum_{j=1}^C \frac{(O_{ij} - E_{ij})^2}{E_{ij}}$$

and compared against a $\chi^2_{(R-1)(C-1)}$ distribution. Expected frequencies are computed as the product of the marginal totals for column $j$ and row $i$ divided by $N$. Rejection of the null hypothesis implies that not all rows (or columns) were sampled from independent populations. This test may be extended to any number of dimensions.

These $\chi^2$ tests have been found to work well with average expected frequencies as low as 2. However, these tests are inappropriate if the assumption of independent observations is violated.

### Comparison of Distributions

A common application of $\chi^2$ is to test the hypothesis that a sample’s parent population follows a particular continuous probability density function. The test is conducted by first dividing the hypothetical distribution into $C$ “bins” of equal width. The frequencies expected for each bin ($E_i$) are approximated by computing the probability of randomly selecting a case from that bin and multiplying by $N$. Observed frequencies ($O_i$) are obtained by using the same bin limits in the observed distribution. The one-tailed test is conducted by using equation 2 and comparing the result to the critical value drawn from a $\chi^2_{C-1}$ distribution. Note that the number of bins, and points of division between bins, must be chosen arbitrarily, yet these decisions can have a large impact on conclusions.

The $\chi^2$ distribution has many other applications in the social sciences, including Bartlett’s test of homogeneity of variance, Friedman’s test for median differences, tests for heteroscedasticity, nonparametric measures of association, and likelihood ratios. In addition, $\chi^2$ statistics form the basis for many model fit and selection indices used in latent variable analyses, item response theory, logistic regression, and other advanced techniques. All of these methods involve the evaluation of the discrepancy between a model’s implications and observed data.

CHOICE IN ECONOMICS

The theory of choice, individual and social, was mainly developed by economists, with crucial contributions from psychologists, political scientists, sociologists, mathematicians, and philosophers.

Individual choice concerns the selection by an individual of alternatives from a set. In standard microeconomic theory, the individual is supposed to have a preference over a set (or a utility function, that is, a numerical representation of the preference). A standard behavioral assumption asserts that the individual selects the best alternatives according to his or her preference. This implies that the preference and the set of alternatives have appropriate mathematical properties. This is the case, for instance, if the set of alternatives is finite (the number of alternatives is a positive integer) and the preference is a weak ordering (a ranking of the alternatives from the most preferred to the least preferred with possible ties). When the set of alternatives is the standard budget set of microeconomics, the selection is still possible when appropriate topological assumptions are made on the weak ordering and the space of goods. The selected alternatives are the demand set. If there is a single alternative, it is the individual demand. It will depend, given a preference, on the budget set that is defined by the individual's wealth and the prices. For a given wealth, as a consequence, demand depends on prices. The behavioral maximization assumption is illuminatingly discussed by Amartya Sen (2002).

Although in microeconomics the standard direction is from preference (or utility) to choice (or demand), revealed preference theory reverses this direction. It is alleged that choice is observable, but preference is not. In revealed preference theory, choice is supposed to reveal preference. More precisely, if choice satisfies suitable consistency properties, one can retrieve preference. As an example of such a consistency condition, imagine that you are making a choice in a department store that includes a food department. Your choice in the entire store that happens to be food must be identical to the selection of food you would make if you visited only the food department. Given this kind of consistency condition, it is possible to retrieve a preference that is a weak ordering.

Uncertainty in individual choice differs whether it is objective uncertainty, à la John von Neumann (1903–1957) and Oskar Morgenstern (1902–1977), or subjective uncertainty, à la Leonard Savage (1917–1971). This entry will discuss only objective uncertainty. In this case, the recourse to utility functions is imperative. The set of alternatives is the set of probabilities over prospects—say, lotteries if the prospects are prizes. The individual has a preference given, for instance, by a weak ordering over the set of lotteries. With a utility function representing a weak ordering (which is possible given appropriate conditions), the only property of the real numbers one can use is the ordering property ("greater than or equal to"). The utility functions are said to be ordinal. They are unique up to a strictly increasing transformation. Over lotteries (with further assumptions), one obtains a utility function (called the von Neumann-Morgenstern utility function) that satisfies the expected utility hypothesis: The utility of a lottery is equal to the sum of the utilities of the prizes weighted by the probabilities. For instance, in a lottery with two prizes, a bicycle and a car, if the probability to win the bicycle is .99 and the probability to win the car is .01, the utility of the lottery is equal to .99 times the utility of the bicycle plus .01 times the utility of the car. When the expected utility hypothesis is satisfied, the utility function is unique up to an affine positive transformation, and differences of utility become meaningful because these differences can be compared according to the 'greater than or equal to' relation. Such utility functions are called cardinal. They are used as the basic element of decision theory under risk, where some further assumptions are made on the utility function (concavity, derivability and properties of derivatives).

Social choice is about the selection of alternatives made by a group of individuals. There are obviously two aspects of social choice corresponding to its double origin: voting and social ethics. Although there were precursors in antiquity and medieval times, the birth of social choice theory is generally attributed to the Marquis de Condorcet (1743–1794) and Jean-Charles Borda (1733–1799), two French scholars, at the end of the eighteenth century. The tremendous modern development of this theory stems from the works of Kenneth Arrow and Duncan Black (1908–1991). Individuals are supposed to have preferences over a set of alternatives. Since these preferences are generally conflicting, one must construct rules to obtain a synthetic (or social) preference or a social choice. Arrow's (im)possibility theorem asserts that there does not exist any rule satisfying specified properties. On the other hand, Black's analysis demonstrates that majority rule generates a social preference provided that some homogeneity of individual preferences (single-peakedness) is assumed.
Arrow’s book ([1951] 1963) established the formalism in which social choice theory has developed since then. Two major results are due to Sen and to Allan Gibbard and Mark Satterthwaite. Sen showed the impossibility of having a rule that admits a minimal level of liberty in the society (the group of individuals) and a principle of unanimity (according to which the social preference or the social choice must respect the unanimous preferences of the individuals). Gibbard and Satterthwaite proved independently that there was no rule that was immune to the strategic behavior of individuals—that is, there are situations in which it is advantageous for an individual to reveal a preference that is not his or her sincere preference.

When individual preferences are over uncertain prospects and are represented by von Neumann-Morgenstern utility functions, John Harsanyi (1920–2000) showed that the utilitarianism doctrine could be revived. In a rather caricatural way, the utilitarianism doctrine asserts that social utility is the sum of individual utilities and that social utility has to be maximized. In some of his works, Harsanyi provided a scientific foundation for a kind of weighted utilitarianism. Harsanyi’s utilitarianism is often opposed to the liberal egalitarianism of John Rawls (1921–2002).

A major trend of recent research on voting theory is about scoring systems (e.g., the plurality rule used in the United States and Great Britain or Bord’s rule). Donald Saari’s contributions to scoring rules are a major advance in social choice and voting theory, with important possible applications.

CHOICE IN PSYCHOLOGY

Since the mid-twentieth century the term choice has been operationally defined in a variety of different ways in psychology. Consequently, the study of choice in psychology reflects this variability. Choice has often been studied as the outcome of a decision-making process. Economic theories of rational choice assume both that the decisions individuals make will determine their behavior and that decisions will be made based on a general set of rational laws. In particular, it is assumed that (1) the decision maker is able to compare all of the alternatives; (2) all comparisons will be consistent (i.e., if A is preferred to B, and B to C, C may not be preferred to A), and (3) the decision maker will engage in utility maximization; that is, will always choose the most preferred option to achieve desired ends.

Aware of the reality that the decisions people make do not always conform to conventional economic assumptions of rational choice, the psychologist Herbert Simon proposed the notion of bounded rationality. That is, rational choice is limited by the cognitive capability of the individual and the complexity of the environment in which a decision is made. Simon proposed that agents will, therefore, engage in satisficing, or accept a choice that is good enough but not necessarily perfect. Simon’s assertions pointed to a notable difference between economic and psychological views of rationality. Namely, traditional economic theories assume that the world is perceived as it really is and that there are no limits on the decision maker’s cognitive capabilities. Consequently, economics takes a substantive view of rationality. That is, choices can be predicted based entirely on knowledge.
about the real world because decision makers always reach a decision that is objectively optimal. In contrast, a strength of the psychological view of rationality is that it is assumed that the decision maker has limited knowledge and cognitive capacity and does not necessarily perceive the world the way it really is. Consequently, psychological theories focus on the process by which decisions are made.

Building on Simon’s contributions, cognitive psychologists Amos Tversky and Daniel Kahneman originated prospect theory to explain irrational human economic choices. In empirical studies on framing, Tversky and Kahneman demonstrated systematic reversals of preference when the same problem is presented in different ways. For example, when decisions are framed in terms of a potential gain, individuals are more likely to engage in risk aversion. Whereas when decisions are framed in terms of a loss, individuals will be more likely to choose the risky option. Tversky and Kahneman documented a number of judgment heuristics and biases that influence the way people assess probabilities under uncertain conditions and thus influence the decisions they make. Notable heuristics and biases include the availability heuristic, base-rate fallacy, anchoring and adjustment, conjunction fallacy, clustering illusion, and representativeness heuristic.

Psychologists have also studied choice as an experience that has consequences for an individual’s sense of personal control, motivation, and self-regulation. According to Edward Deci and other theorists, it is theorized that autonomy and competence are fundamental human needs that underlie intrinsic motivation, the drive to engage in a task for its own sake. Social contexts that satisfy these needs will enhance intrinsic motivation and related outcomes. Consequently, research on the topic has suggested that the provision of choice may be one contextual factor linked to adaptive motivational and achievement outcomes. Even the perception of choice, as opposed to true choices, has been demonstrated to have beneficial effects on motivation-related constructs.

However, late-twentieth-century research has suggested that choice is not ubiquitously beneficial. In particular, although Caucasian Americans seem to benefit from making personal choices, individuals from Asian cultures seem to benefit more when choices are made by significant others. Further, proponents of self-regulatory perspectives of choice have shown that choice may actually have detrimental effects to the extent that making a choice is effortful, resulting in decreased energy needed for future tasks. In fact, research has shown that having fewer choices is more motivating than having an extensive, and potentially overwhelming, array of choices. Potential explanations for contradictory findings have been offered. In particular, the nature of the choice experience may be influential moderator of the effect.

**CHOLESKY DECOMPOSITION**

The Cholesky decomposition factorizes a positive definite matrix $A$ into a lower triangular matrix $L$ and its transpose, $L'$:

$$A = LL'$$

This decomposition is named after André-Louis Cholesky (1875–1918), a French artillery officer who invented the method in the context of his work in the Geodesic Section of the Army Geographic Service.

The $k \times k$ real symmetric matrix $A$ is positive definite if and only if $x'Ax > 0$ for any nonzero $k$-vector. For such matrices, the corresponding Cholesky factor $L$ (sometimes called the **matrix square root**) always exists and is unique. Matrices of this sort arise in many econometric contexts, making the Cholesky decomposition a very useful computational tool. For example, it can be used to solve the normal equations of least squares to produce coefficient estimates in multiple regression analysis. In this case, the place of $A$ is occupied by the matrix of squares and cross-products of the regressors, $XX$. 

**Cholesky Decomposition**
Given the Cholesky decomposition of \( A \), the set of linear equations \( Ax = b \) in the unknown vector \( x \) may be written as \( LL'x = b \). Writing \( y \) for \( L'x \), we get \( Ly = b \), which may be solved for \( y \), then \( y = L'x \) is solved for \( x \). It is trivial to solve equations on the pattern \( Mx = b \) for triangular \( M \).

Algorithms for computing the decomposition are based on the following relationships between the elements \( a_{ij} \) of \( A \) and the elements \( l_{ij} \) of \( L \):

\[
l_{i,j} = \frac{1}{l_{j,j}} \left( a_{i,j} - \sum_{k=1}^{j-1} l_{i,k}l_{j,k} \right), \quad i > j
\]

\[
l_{i,i} = \sqrt{a_{i,i} - \sum_{k=1}^{i-1} l_{i,k}^2}
\]

Element \( l_{i,j} \) can be computed if we know the elements to the left and above. The Cholesky-Crout algorithm starts from the upper left corner of \( L \) and calculates the matrix column by column.

The beauty of the Cholesky method is that it is numerically stable and accurate (as noted by Turing 1948) while requiring fewer floating-point operations and less workspace (computer memory) than alternative methods. It does, however, have a problem if the matrix \( A \) is very ill-conditioned. (In the econometric context mentioned above, this occurs if there is a high degree of collinearity among the variables in the data matrix \( X \).) Computing the decomposition requires that we calculate a sequence of square roots. The values under the square root sign in equation (2) are always positive in exact arithmetic, but for ill-conditioned \( A \) they may be very small. Given the rounding error inherent in finite-precision computer arithmetic, these values may go negative—in which case the algorithm cannot continue—or they may simply fall below the magnitude at which rounding error is an acceptable proportion of the computed value. A practical implementation of the Cholesky algorithm for a digital computer must check for this condition and terminate if need be. If the Cholesky method fails, one can resort to the computationally more expensive QR or SVD decomposition methods.

Besides solving sets of linear equations, the Cholesky decomposition has a further use in econometrics that deserves mention, namely, decomposing the covariance matrix for a set of residuals in the context of a vector autoregression. This sort of analysis was pioneered by Christopher Sims (1980) and quickly became popular. The role of the decomposition is to permit the simulation of the response of a system to a disturbance in any one of the variables, and also to perform an accounting of the proportions of the forecast error variance attributable to disturbances in each of the variables.

**CHOMSKY, NOAM**

*1928–*

In the field of linguistics, Noam Chomsky occupies a position close to that held by Isaac Newton in physics during the eighteenth century. Because language is central to being human, Chomsky has also long occupied a foundational role in the cognitive sciences that have burgeoned since the middle of the twentieth century. While Newton had an equally intense and ambitious career as an alchemist and a doomsday Biblical scholar, the political Sir Isaac kept these careers, largely successfully, a dark secret. Chomsky, however, has published dozens of books and countless articles throughout his life expressing leftist, egalitarian, anarchist views with almost unimpeachable moral authority and meticulous scholarship. Yet Chomsky has insisted that his scientific work in no way supports or "proves" his political views, other than his insistence that humans, in having cognitive command of a discrete infinity of linguistic structures, are beyond the comprehension of the empiricist behaviorism dominant in mid-twentieth-century American academic circles.

Born in Philadelphia in 1928, Chomsky pursued his undergraduate studies at the University of Pennsylvania, where he studied with Zellig Harris, a structural linguist who saw linguistics as the compact description of a community’s time-bound finite corpus of utterances (literally, sonic sequences of supposed phonetic atoms). Chomsky completed his graduate work while a Junior Fellow at Harvard University between 1951 and 1954, and he became a professor at MIT in 1955, rapidly advancing to a series of distinguished professorships. His books *Syntactic Structures* (1957) and *Aspects of the Theory of
Syntax (1965), which have made him the most cited living author, soon revolutionized linguistics.

The opening three sentences of Syntactic Structures tersely render his formalized, mentalist, and nativist view:

Syntactical investigation of a given language has as its goal the construction of a device for producing the sentences of the language under investigation.... The ultimate outcome of [such] investigations should be a theory of linguistic structures in which the descriptive devices utilized in particular grammars are presented and studied abstractly.... One function of this theory is to provide a general method for selecting a grammar for each language, given a corpus of this language. (Chomsky 1957, p. x)

Formally speaking, one cannot describe a human language by listing its sentences, simply because there are an infinite number of them. One must therefore describe a device that would generate these, and only these, sentences. This “device” would display the knowledge that a competent human speaker of this language has. Language is the device, the internal brain/mind device, not the finite behavioral outputs that this device, coupled with others, produces. Linguistics is thus a branch of psychology.

Behaviorists such as B. F. Skinner thought that knowledge of language consisted of associations between particular words (heard sound sequences). Through repetition, humans learn the sound sequences “How are you,” “I would like a red apple,” and “I am fine,” but not “Are you how,” “Red a like would I apple,” “Am fine I,” and so on. An associative grammar like this is called finite state grammar; it fits well with the empiricist notion that humans learn everything through (sequences of) sensory experience, and it makes no use of “dubious” abstractions such as noun, pronoun, verb, auxiliary verb, or adjective.

Yet there is massive evidence that people routinely produce new sentences that they have never heard before and that have never been produced in the history of their language. Even if sentences are limited to fifteen words or less, there are literally trillions of different but perfectly grammatical sentences of English. In fact, Chomsky gave a decisive formal proof that no human language could be generated by a finite-state grammar. We simply have to internalize at least a phrase structure grammar that makes use of rules that deal in abstract categories such as noun phrase, verb phrase, noun, pronoun, verb, auxiliary verb, and so on. Indeed, Chomsky proved that even a phrase-structure grammar is not all that is needed, and that the surface structure of a sentence is not a reliable guide to its deeper features.

Human languages have in common many principles and processes, word forms and structures, and rules and features. What the linguist describes, therefore, belongs to human language as much as to a particular language (abstracting, of course, from the peculiarities of particular idiolects and dialects toward humanly universal cognition). Indeed, every one of the hundreds of human language that has been described makes use of the same phrase-structural concepts of noun phrase, verb phrase, pronoun, verb, adjective, and so on. In the linguistic theory of the last two decades, it appears that a small number of principles and initial parameter settings determine every aspect of grammar that makes a human language and differentiates it from other human languages (a good thing, too, because the human baby seems equally prepared to take on any human language to which it is exposed). Chomsky has speculated that a Martian anthropologist would regard all human languages as essentially the same language.

“A general method for selecting a grammar for each language,” given a sample corpus, would also be the knowledge a human child brings to the samples of a language to which the child is exposed. A vast body of evidence about child language development has persuaded nearly all linguists and cognitive scientists that the human child is preprogrammed with a “language acquisition device.” To give an example from personal experience that is familiar to investigators of language learning, the two-year-old daughter of this author, Casey, exploded into using auxiliary verbs and tag negations over the space of two weeks, saying “I am going,” “I can’t,” “Susan isn’t here.” All of the auxiliary verbs came in at virtually the same time, and Casey tag-negated only those verbs, no others: She never said “I eatn’t,” “I go’n’t,” “Susan walk’n’t,” or “The cat grab’n’t the bird.” She also said “I amn’t” and “I am going, amn’t I.” No one around Casey ever said “amn’t,” but she went on happily using the construction, and it wasn’t until she started school two years later that she realized no one else talked that way. Of course, Casey was doing what comes naturally. In some sense, she (or some part of her brain/mind) knew what auxiliary verbs and regular verbs were, and she knew that you could tag-negate (put “n’t” after) auxiliaries but not after other verbs. She also never said “I am going, aren’t I,” because she knew that “am” is a singular verb, that “are” is a plural verb, and that “I,” being a singular pronoun, could not take a plural verb (“are”).

Now, of course, Casey had never heard the English words “nound,” “verb,” “auxiliary verb,” “tag-negate,” “pronoun,” “plural,” or “singular.” Nonetheless, she (or some part of her brain) knew perfectly well the word kinds that these English words name, just as a monolingual speaker of Urdu knows what nouns, pronouns, and verbs are, although he may have no idea what spoken label (in Urdu or English) to use for these perfectly familiar word kinds. It is this sense of knowing, of linguistic competence, that linguistics now clearly emphasizes.
But how did Casey know about these things when no one around her ever tried to explain them to her? The linguist’s answer is that hearing something is an auxiliary verb or a pronoun is just like seeing that something is a red ball or a small animal. So Casey, just like any other human child whether in a literate or tribal community, identified the different word kinds present in her environment, although no one was explicitly coaching her to do this. She recognized that auxiliary verbs, but not other verbs, could be tag-negated, so she said “I amn’t,” just as she said “I can’t” or “He isn’t,” because she saw that “am” was an auxiliary verb, and so could be tagged with “n’t.” Speaking and hearing a natural language is a competence acquired naturally (in the first several years of life), while reading and writing requires—unfortunately—years of effort and explicit instruction. Similarly, our basic visual/motor competencies come to us naturally in our first years. Our recently burgeoning “cognitive sciences” attend to this central aspect of being human, the characteristic competencies or faculties that make us homo sapiens.

Chomsky maintains that his work in linguistics, and cognitive science generally, have virtually no connection with his political and moral views—views for which he claims no expertise, although he has published countless articles, books, interviews, and commentaries on political and moral matters. He claims no professional expertise in such matters because he believes that no one really has such expertise. To Chomsky, political and moral matters can and must be understood by all citizens, not just by elites or would-be professional apologists for elites (or, more particularly, corporate wealth and power). Chomsky rose to public attention (and the Nixon White House’s “enemies” list) for his opposition to the Vietnam War, although his subsequent opposition to U.S. imperialism more generally, particularly in the Middle East, and his criticism of the U.S. media bias have muted his ability to address the U.S. public. Hence, Chomsky and his political and moral views are better known outside of the United States. It should be said that Chomsky has consistently maintained that U.S. behavior, as a dominant world power, is no worse than previous dominant world powers, such as Britain in the eighteenth and nineteenth centuries and Imperial Rome.

CHOW TEST

The term Chow test refers to a family of statistical tests used mainly, but not exclusively, in econometrics. The aim of all the tests in the family is to test for parameter constancy across all the observations of the sample of data under analysis. In econometric modeling, parameters usually have some economic interpretation, such as the responsiveness, or elasticity, of some variable to changes in another. If a model is to have any predictive power, it is important to check the assumption of parameter constancy. A Chow test is a way to perform such a check.

Economic data frequently take the form of time series. A time series constitutes a record of the history of an economic variable, such as the unemployment rate. Each individual observation of a time series is associated with a given period of time, which may be a year, a quarter, or even, in the case of financial data, a few minutes. In time series modeling, one looks for patterns in the dynamic evolution of a set of series. Such patterns can take various general forms, but all of them depend on parameters, the values of which are usually unknown.

From time to time the economic environment undergoes structural changes. A classic example is the Great Depression of the 1930s, a later one the abandonment in the 1990s of many European national currencies in favor of a single currency, the euro. Changes of this importance can be expected to lead to changes in the values of at least some of the parameters of economic models, and these changes often can be detected by a Chow test.

The term cross-section data is used to designate data sets that record aspects of economic units, such as firms, households, or governments, at a particular point in time. Failure of parameter constancy can arise in cross-section models if the observed units display too much heterogeneity so that, for instance, men may be described by parameters different from those suitable for women, rich countries may differ from poor ones, and small firms from large ones.

In 1960 Gregory Chow, then an associate professor at Cornell University (and from 1970 to 2001 a professor of economics at Princeton University, where the Econometric Research Program is now named in his honor), published a paper in Econometrica in which he laid out various versions of the Chow test. Chow’s main research interest at that time was the demand for automobiles in the United States. In earlier work he had proposed
an econometric model based on data for the years 1921 to 1953, and as data had become available for the period 1954 to 1957, Chow wanted to see whether his old model could explain the new data. He used the tests he had developed in his earlier paper for this purpose, and concluded that the old model was still good.

Students of econometrics in the 1960s found Chow’s paper hard to understand. Consequently, in 1970 Franklin Fisher, a professor of economics at the Massachusetts Institute of Technology, published an article in *Econometrica* in which he set Chow’s tests in the context of the statistical literature, and showed how they all could be viewed as F tests, that is, standard tests used to check whether a parameter or parameters are significantly different from zero. As a result of Fisher’s exposition, the Chow test became a very widely used tool of applied econometrics, implemented in all standard software.

CHRISTIANITY

Christianity, as its name suggests, is a religion practiced worldwide devoted to the worship and example of Jesus Christ. Jesus was a preacher who lived and taught in Israel two thousand years ago. The word Christ means “anointed” and refers to the fact that his followers believed he was anointed by God, whom many Christians believe to be his father, to redeem Israel. These disciples considered the work of Jesus to be the fulfillment of prophesies in the Hebrew scriptures, which they came to call the Old Testament. For a New Testament they added gospels (stories of his life) and epistles, which were letters to early Christian communities. These focus on the account of Jesus’ death by crucifixion, their belief that he was raised from the dead, and the idea that his disciples were commissioned to carry his message to the entire world.

THE JEWISH HERITAGE AND CHRISTIAN EXPANSION

Despite the common roots of Judaism and Christianity, almost at once Christians and Jews went separate ways and sometimes fell into conflict, which led to Christian anti-Semitism and frequent persecutions of Jews. In the twenty-first century serious efforts are bringing the two communities into conversation and often common action, but relations remain tense in some communities.

From their original home in Jerusalem, believers in Jesus quickly moved north and east, where at Antioch in Syria they were first named “Christians.” During the next four centuries this faith born in Asia also became a vigorous presence in North Africa, which was part of the Roman Empire, and in Europe, with which it came to be most identified until the twentieth century. In the fourth century Christianity, once harassed or forbidden, became the favorite of emperors and the established religion of the Roman Empire. In and after the sixteenth century missionaries and colonialists took the faith into South and North America, and in the early twenty-first century its churches prosper most in the Americas, sub-Saharan Africa, and Asia. About two billion followers, almost one-third of the human race, consider themselves Christian.

CENTURIES OF CONFLICT AND ENTERPRISE

Though Roman emperors were some of the first enemies of Christianity, the sudden rise of Islam in the seventh century led to Muslim conquests of most of North Africa, where Christianity eventually all but disappeared. Muslims also conquered Palestine—the “Holy Land” to Christians, Jews, and Muslims—and advanced in Europe. During the eleventh, twelfth, and thirteenth centuries Christian leaders called for crusades to retake the holy places, especially in Jerusalem, and undertook many military ventures against then-Islamic territories.

Internal conflicts also beset Christianity. In the eleventh century the Eastern and Western churches, long in tension over doctrine and practice, separated. At issue in the separation was both the refusal of the Eastern Christians to regard the pope as the supreme authority and a doctrinal point about how Jesus Christ related to God the Father. Many political and cultural issues also led to the break. Within Western, or Roman Catholic, realms there was also conflict, some of it marked by the Inquisition, a name given to severe efforts by official Catholicism to purge itself of individuals and groups that were suspected of heresy against the church (which generally included anyone who was not a practicing Catholic or who refused to convert). The Protestant Reformation, beginning in the early sixteenth century, permanently divided the Western church. That Reformation was fought over, among other things, the authority of the church and the Bible, with Protestants claiming that they relied only on the divinely inspired scriptures and not on human authority, such as that of the pope (the leader of
the Roman Catholic Church). In more recent times Protestants have argued among themselves over biblical authority: was the Bible the “inerrant” word of God, or might it be interpreted in such ways that its human elements also stand out? Through it all the same zeal that produced crusades, inquisitions, schisms, and reformations inspired clerics and laypeople alike to create distinctive cultures marked by the invention of the university in the late Middle Ages, cathedrals, great art, and institutions for providing health care. Such energies also led to diversity in teaching and governance. Roman Catholics remained loyal to the pope. Lutheranism, inspired by the German religious reformer Martin Luther (1483–1546), eventually became recognized worldwide as another denomination of Christianity. Similarly the Church of England (Anglicanism), or in the United States the Episcopal Church, rejected papal authority. A third tradition, often called Reformed— informed by the writings of the French theologian and reformer John Calvin (1509–1564) in Switzerland, parts of Germany, and the Netherlands along with John Knox (1513–1572) in Scotland—stressed divine sovereignty. Still another cluster, sometimes called Radical or Anabaptist because its adherents “rebaptized” those who had been received into the church through infant baptism, spread, though its members were often persecuted by other Christians.

STORIES, DOCTRINE, AND ORGANIZATION

While Christian teaching draws most deeply on the Bible, its leaders found it necessary to advance from telling informal stories to engaging in more formal expression in doctrines—official teachings that define the tenets of the faith. At a series of ecumenical (worldwide) councils during and after the fourth century, theologians, emperors, and bishops wrestled with basic questions. Christianity is strongly monotheistic, professing faith in one God (as is Judaism and Islam). But Christians also believe in a complex doctrine called the Holy Trinity, by which God is considered as existing in three persons: the Father (God), the Son (Jesus), and the Holy Spirit. They also wrestle with the ways to affirm and proclaim that the human Jesus also has divine status. Later councils dealt with the workings and effects of Christ in the church and in the greater community. According to Christian doctrine, Jesus is regarded as the “savior” of believers from their sin, which has distanced them from God, as well as the one who brings them salvation and inspires them to acts of love and justice.

Christians have worked with many forms of organization, usually stressing either episcopal government—which means rule by bishops, as in Roman Catholicism, Eastern Orthodoxy, and Anglicanism—or more “democratic” patterns, such as rule by elders or congregants themselves in the millions of local Protestant congregations or parishes. Referring to Christianity as a community may seem strained, because it is broken into around thirty thousand subcommunities called church bodies or in some places denominations. In the third millennium the most rapid new growth is in Pentecostalism, a movement of believers who profess the power of the third person of the Trinity, the Holy Spirit. Pentecostalism stresses the immediate experience of God through “signs,” such as healing or speaking in indecipherable spirit-guided vocalizations (speaking in tongues).

The central act of Christians everywhere is worship, usually guided by an ordained or specially appointed leader, named a priest, pastor, or preacher. Christian worship can be formal in cathedrals or informal in home and outdoor settings. Most Christians stress preaching at worship, meaning pronouncing judgment on erring believers and verbally offering forgiveness or grace to those who repent and set out to change their ways.

The other feature in most Christian assemblies is the sacramental life. Most Christians baptize new members with water and offer followers a sacrament, or Eucharist, which was instituted at Jesus’ Last Supper, where bread and wine are consecrated and consumed in remembrance of Jesus’ death (also called the Communion). Through this sacrament it is believed that members receive forgiveness, deepen their community life, and are empowered to serve God, especially by serving their neighbors and people in need.

SOCIAL AND CULTURAL CONTEXTS

Throughout its history Christianity has been influenced by the societies in which it thrives. After opposition within the Roman Empire early on, Christianity became the religion established and protected by law. The spectrum of attitudes within the Christian community includes everything from ascetic monasticism to artistic creations. In early Christianity church and regime were separate, and in modern free societies “church and state” remain legally distinct. At the same time Christian faith is very much a public affair, promoting movements of social reform and charity. Furthermore while Jesus’ own teaching inspires pacifists and other peacemakers, faith in a powerful and judgmental God has also authorized arbitrary rule and wars.

Devoted as Christians have been to social, cultural, and often political expressions, their creeds or statements of faith also teach that the world as it is now will someday end. While many Christians may agree that the future and the end are determined by God, they differ widely on the
questions of how the end will come, though somehow most associate it with the “Second Coming” of Jesus Christ.

CHURCH, THE
The English word church and the German Kirche derive from the Greek Kyriake, which means “that which belongs to the Lord.” The Romance languages derive their words for church (iglesia, chiesa, église, etc.) from the Latin word ecclesia, which derives from the Greek, ekklesia, which means “convocation” or “assembly.” In the Greek Septuagint translation of the Hebrew Bible, ekklesia is used about 100 times to render Hebrew words like qahal that refer to the “assembly” of the Lord. In the New Testament the term ekklesia occurs 114 times and is used either for the whole Christian community (Gal. 1:13; 1 Cor. 15:9; Matt. 16:8) or for local or particular churches (1 Cor. 1:2; Rev. 1:4, 2:1, etc.).

Only one of the four Gospels, Matthew, uses the word ekklesia (Matt. 16:8; 18:17), but the term is used twenty-three times in Acts, sixty-five times in Paul, and twenty times in Revelation. This absence of ekklesia in three of the Gospels is probably the result of the Christian belief that the church only replaces Israel as the “People of God” following Jesus’ death, resurrection, and ascension and the outpouring of the Holy Spirit on the day of Pentecost (Acts 2). Christians, however, see the words and actions of Jesus during his earthly ministry as foundational for the church, and they look upon the history of Israel from the time of Abraham to Jesus as the “preparation” or “prefiguring” of the Christian Church.

THE EARLY CHURCH

In the early church, leadership seems to have been both charismatic (some were “prophets”; 1 Cor. 12:48) and hierarchical (with overseers/bishops; elders/presbyters, and ministers/deacons; Phil. 1:1; 1 Tim. 3:1–13, 5:17–20; Titus 1:7–9). In the early second century Ignatius the Martyr (d. c. 107) testifies to three distinct ministries or orders in the universal (“catholic”) church: bishop (episkopos), presbyter (presbyteros), and deacon (diakonos). By the end of the second century Irenaeus (c. 130–200), the bishop of Lyons, points to the Church of Rome as having a “more powerful principality” because it is the church of the apostles Peter and Paul.

The “rule of faith” in the early church was the teaching of Jesus and the apostles. By the late second century, however, Bishop Irenaeus upholds the normative value of the four written testimonies to Jesus’ life and mission known as the Gospels of Matthew, Mark, Luke, and John (written c. 65–90 CE). The letters attributed to Paul also achieve scriptural status, and by the late fourth century (367) Bishop Athanasius of Alexandria, Egypt, specifies the definitive list, or “canon,” of the twenty-seven writings of the New Testament as they remain in the early twenty-first century. The African Councils of Hippo (393) and Carthage (397) endorse the longer list of forty-six Old Testament books as canonical (a list later upheld by the Catholic Council of Trent in 1546, although the Protestant Reformers favored the shorter Old Testament of thirty-nine books).

The Christian Church spread throughout the Near East and the Mediterranean basin during the first three centuries of the Common Era in spite of periodic persecutions from Roman emperors, such as Nero (64–68), Domitian (95–96), Trajan (106–117), Marcus Aurelius (161–180), Decius (249–251), and Diocletian and Galerius (303–311). The spread of the faith amid such persecutions prompted the Christian writer Tertullian (c. 150–220) to remark that “the blood of the martyrs is the seed of Christians.”

In 313 the Roman emperor Constantine (later baptized a Christian) granted legal recognition and religious freedom to Christianity by the Edict of Milan. In 330 he moved the capital of the empire from Rome to Byzantium in Asia Minor (later renamed Constantinople). This move led to the recognition of Constantinople as the “New Rome” and a leading center of Christian culture. By the
fifth century there were five major centers or “sees” of the Christian Church: Rome in Italy, Constantinople in Asia Minor, Alexandria in Egypt, Antioch in Syria, and Jerusalem.

THE DEVELOPMENT OF CHURCH DOCTRINE
Between 325 and 787 seven major (ecumenical) church councils were held to clarify points of doctrine in resistance to various teachings considered to be false or heretical. A profession of faith linked to the first two ecumenical councils of Nicea I (325) and Constantinople I (381) summarized the basic points of Christian faith, especially the belief in the Trinity (three persons in one God: the Father, the Son, and the Holy Spirit) and Jesus Christ as consubstantial or “one in essence” with the Father. This profession of faith, known as the Nicene-Constantinopolitan Creed (or simply the Nicene Creed) also describes the Christian Church as “one, holy, Catholic and apostolic.”

Other doctrinal proclamations followed. The Council of Ephesus in 431 affirmed Mary as the “God-bearer” or “Mother of God.” The Council of Chalcedon in 451 described Jesus as one person with two natures (human and divine). The Second Council of Nicea in 787 condemned iconoclasm (opposition to the use of sacred images or icons) and reaffirmed the right to give veneration (though not worship) to icons of Jesus, Mary, the angels, and the saints. This council also reaffirmed the condemnation of forced conversions to the Christian faith.

Although these councils sought unity in the church, various groups of Christians resisted their teachings and formed separate ecclesiastic bodies. The Arian churches (named after the Egyptian Christian priest Arius) denied the full divinity of Christ and rejected Nicea I and Constantinople I. The Church of the East, or “Nestorian Church,” rejected the teaching of Ephesus (431) on Mary as the Mother of God. It found refuge in the Persian Empire and spread to parts of India and China. Large numbers of Christians in Armenia, Egypt, Ethiopia, and East Syria resisted the doctrine of Chalcedon (451) and formed the “Monophysite” (one-nature) churches, also known as the Oriental Orthodox churches.

THE CHURCH IN THE MIDDLE AGES
In the 600s Islam rose under Muhammad (570–632), beginning in Arabia. The Muslims, or followers of Islam, denied the Trinity and understood Jesus as a prophet/messenger of God rather than the divine Son of God. They claimed that their holy book, the Qur’an, corrected the mistakes of the Jewish and Christian scriptures. The Muslims became a military power and conquered Jerusalem in 638; Alexandria, Egypt, in 642; Carthage, North Africa, in 698; and Spain in 712. The Muslims were set to conquer the rest of Europe but were defeated by Charles Martel in 732 in France.

Because of the threat of Islamic expansion, the popes in the West formed an alliance with the Franks for military protection. The crowning of the Frankish king Charlemagne as the Holy Roman Emperor by Pope Leo III in 800 can be understood as the beginning of the Middle Ages in the West. The Byzantine Christians resented the recognition of another “Roman” emperor because they saw themselves in continuity with the empire of Constantine. This resentment contributed to the 1054 schism (split) between the churches of Rome and Constantinople, which led to an enduring separation of the Eastern Orthodox Churches from the Catholic Church under the pope. The split was mostly over the Orthodox rejection of the pope’s primacy of jurisdiction over the churches in the East and the addition of the phrase “and the Son” (filioque) to the creed. Later attempts at reunion in 1274 and 1439 were not successful.

In spite of the split between Rome and Constantinople, the perceived threat of Islam, now under the rule of the Turks, led to the Byzantine emperor appealing to the pope for military aid. The result was the Crusades, a series of military ventures authorized by the popes and other Christian leaders to recapture the Holy Land from the Muslims. These Crusades began in 1095 and ended in 1291. Jerusalem was captured by the crusaders in 1099 and a Latin kingdom established. The Muslims, however, regained control of the holy city in 1187, and the other Crusades were mostly failures. Some tragedies also took place, such as the sack of Constantinople in 1204 by the Western crusaders, which deepened the split between Rome and Constantinople.

The church, as a cultural and political entity, played a major role in the history of western and eastern Europe during the Middle Ages (c. 800–1400), and it provided inspiration and support for education and the arts. Though elements of pre-Christian classicism revived during the Renaissance (c. 1400s–1500s), Europe remained essentially Christian, and the secular rulers defended the church (though tensions did exist). Non-Christians, such as the Jews, also lived in Christian Europe during this time, but their situation was sometimes precarious.

THE RISE OF PROTESTANTISM
The Reform or Protestant movements of the 1500s resulted in new Christian churches distinct from the Catholic Church under the pope. The Protestant movements—identified traditionally as Anglican, Lutheran, Calvinist/Reformed, Anabaptist, and Spiritualist—tended
to accept only the Bible as the normative Christian authority. When Protestant groups differed in their interpretations of the Bible, multiple Protestant groups were formed.

The Protestant movements resulted in wars of religion when nations and rulers sided with either the Protestants or the pope. By the time of the Treaty of Westphalia of 1648, the landscape of Europe was broken up into various Catholic and Protestant regions, with the prevailing policy of following the religion of the local region’s ruler (cuius regio, cuius religio). Beginning in the 1500s Catholic and Protestant explorers began to bring their church structures with them to Asia, Africa, and the Americas.

THE CHURCH IN THE MODERN WORLD

Christianity in the early twenty-first century comprises three main groups, Catholic, Orthodox, and Protestant, with Anglicans claiming aspects of both Catholicism and Protestantism. For Catholics (often called “Roman Catholics”) the church is held in communion by the three visible bonds: unity of faith, unity of seven sacraments, and unity of ecclesial government (bishops in communion with and under the pope, the bishop of Rome). Catholics also conceive of the church as visible and invisible, consisting of three states: the faithful on earth, those undergoing postmortem purification, and the saints in heaven.

Orthodox Christians (those of right worship and doctrine) see themselves as the “one, holy, apostolic and Catholic Church” of the Nicene Creed. This one church is a communion of self-governing (autocephalous) churches bound together by the apostolic succession of true bishops, divine worship and the seven sacraments (or mysteries), and the apostolic faith of the first seven ecumenical councils (Catholics, though, accept twenty-one councils as ecumenical).

Except for the Anglicans/Episcopalians (who see themselves in continuity with the apostolic succession of bishops), Protestant Christians tend to understand the church as “the congregation of the saints” (Lutheran Confession of Augsburg, 1530) or as “the universal Church, which is invisible,” consisting of “the whole number of the elect” (Calvinist Westminster Confession of Faith, 1643). While the visible church is important for the teaching of correct doctrine and the rightful administration of the sacraments (reduced from seven to baptism and the Lord’s Supper), Protestants tend to understand the church more as an invisible communion of those chosen by God for justification in Christ. Especially among contemporary “evangelical” Christians, the denomination of one’s Christian community does not matter as much as one’s faith and commitment to Jesus Christ as Lord and Savior.

Since the rise of modern secular states (late 1700s–1900s), the Christian churches generally no longer enjoy the patronage of state support. They do, however, play an important role in various works of charity, education, and involvement with causes of peace and social justice. The witness of the church has grown to be more moral than political, although a political dimension is clearly present in many cases.

CHURCH AND STATE

Relations between the sacred and the secular have long been important issues in Western democracies. In particular, legal questions surrounding the relationship between church and state in the United States have frequently animated American politics since World War II (1939–1945). The 1940 Supreme Court decision in Cantwell v. Connecticut had the effect of incorporating the religion clauses of the First Amendment of the U.S. Constitution, and applied these provisions to the acts of state governments. The incorporation of the First Amendment clauses dealing with religion has resulted in a large outpouring of case law during the final third of the twentieth century, as well as the first decade of the twenty-first.
THE ESTABLISHMENT CLAUSE
The First Amendment of the U.S. Constitution begins with the phrase, “Congress shall make no law respecting an establishment of religion.” This phrase, usually termed the establishment clause, has, in recent decades, defined the limits under which government (and, by extension, popular majorities) can provide symbolic support for religious values or material support for religious organizations.

There are two general theories by which the establishment clause can be interpreted. According to advocates of accommodationism, the establishment clause simply prohibits government from designating an official church, or providing preferential treatment to one church or religious tradition. Neutral, nonpreferential assistance to religion is considered permissible by accommodationists. By contrast, adherents of separationism believe that any assistance for religion by government is unconstitutional and that there must exist a “high wall” of separation between church and state.

The operative legal precedent with respect to establishment-clause jurisprudence is the 1971 case of Lemon v. Kurtzman. In Lemon, the court held that government assistance to religion was not constitutional unless such assistance: (1) had a primarily secular purpose; (2) had a primarily secular effect; and (3) did not result in “excessive entanglement” between church and state. The Lemon test is considered to represent a generally separationist precedent, since it limits general assistance to religion, as well as assistance to particular religions.

In general, the Supreme Court has employed the Lemon test in cases posing establishment clause issues, but the Court has begun to relax its application of the criteria under which government assistance to religion can be rejected as unconstitutional. To illustrate, in Agostini v. Felton (1997), the Court ruled that state governments could provide (and fund) remedial instructors in parochial schools. Similarly, by a five-to-four margin, the Court held in Zelman v. Simmons-Harris (2002) that a program of government-financed tuition vouchers for students at private schools did not violate the “effects” prong of Lemon, despite the fact that a large majority of private schools in Ohio were religiously affiliated. Thus, the U.S. Supreme Court is gradually moving in a more accommodationist direction from a generally separationist precedent.

Of course, many governmental accommodations to religion are politically popular, and are therefore frequently enacted by elected officials. Most conspicuously, the policy of government-supported “faith-based initiatives” was proposed by President Bill Clinton and enacted with the support of President George W. Bush. The constitutionality of such initiatives had not been subjected to court tests as of 2006, and recipients of such grants had to conform to certain standards to ensure that government funds were only used for “secular” purposes. This trend is clearly moving in the direction of a looser interpretation of the establishment clause, although the actual amount of government assistance to religious bodies is uncertain.

THE FREE EXERCISE CLAUSE
The second First Amendment clause that deals with religion—“or prohibiting the free exercise thereof”—is generally termed the free exercise clause. The free exercise clause has usually defined the limits of governmental power to control religiously motivated activities.

There are two general theories of the free exercise clause. Libertarianism entails a belief that religious obligations often supersede the requirements of citizenship and that government should be very deferential to religious beliefs. Proponents of communalism believe that religion is accorded no special protection under the free exercise clause and that the clause simply prohibits government from singling out religious practices for specific regulation. However, communalists believe that generally neutral laws that happen to restrict religious liberty pose no constitutional difficulty.

In the 1990s the Supreme Court’s free exercise jurisprudence took a drastic shift in the direction of communalism. Prior to 1990, the Court’s reading of the free exercise clause could generally be characterized as libertarian. Based on precedents such as Sherbert v. Verner (1963) and Wisconsin v. Yoder (1972), the Court held that government could only interfere with religious free exercise if the restriction on religious freedom served an “essential” government purpose, and if the means of achieving that purpose were the least restrictive available. The Sherbert-Yoder test was thus quite deferential to the free exercise claims of religious minorities.

In 1990 the Court held in Employment Division v. Smith that otherwise valid laws that had the effect of restricting religious freedom were constitutionally permissible, unless religious practice was singled out for specific regulation, or unless the legislature had made an explicit exception. In City of Boerne v. Flores (1997), the Supreme Court reaffirmed this ruling and struck down a congressional statute intended to restore the Sherbert-Yoder standard. Thus, the Smith ruling signaled an important change in the manner in which the Court interprets the free exercise clause.

Some critics have charged that the Smith ruling was intended to make it easier for government to regulate religions that lie outside of the theological or cultural mainstream. Indeed, one effect of Smith has been to permit government at all levels to be less deferential to unconventional religious traditions. However, the Court’s reaffirmation of the Smith ruling in Boerne (which limited the free exercise prerogatives of the Roman Catholic Church in a
predominantly Catholic area) suggests that the Court is willing to limit the scope of the free exercise clause in a relatively uniform manner. Of course, elected officials are more likely to regulate the activities of unpopular religious groups, and Americans have been shown to be less tolerant of practitioners of faith traditions outside of the Judeo-Christian tradition.

TENSION BETWEEN THE RELIGION CLAUSES

In general, courts in the United States have tended to treat establishment clause issues separately from issues involving the free exercise clause. However, many actual controversies have seemed to involve both considerations, and supporters of different policies have typically invoked both clauses in support of their positions. For example, the U.S. Supreme Court has, in a long string of decisions, restricted state-sponsored religious expression in public schools on establishment clause grounds. These decisions have proscribed organized classroom prayer, a moment of silence for “prayer or meditation,” ceremonial prayers at high school sporting events or graduations, and restrictions on the teaching of evolution in biology classes. In such cases, opponents of these decisions have criticized these court rulings on free exercise grounds.

Parties to these decisions, as well as members of Congress and state legislators, have argued that the right of religious free exercise entails the right to express one’s religious beliefs publicly, and government policies that limit such expression violate the free exercise clause. Such arguments typically emphasize the “voluntary” nature of school prayer or an “even-handed approach” to the creation-evolution controversy, and suggest that the courts are restricting constitutionally protected religious expression with an overly broad interpretation of the establishment clause.

Arguably, it matters a great deal whether a particular controversy is characterized as an issue of religious establishment or a question of religious free exercise. While many legal scholars have attempted to provide a general solution to the tension between the Constitution’s two religion clauses, such arguments typically involve the assertion that one of the religion clauses has priority over the other. However, neither the text of the Constitution nor recent Supreme Court rulings provide meaningful guidance as to how apparent conflicts between the establishment and free exercise clauses should be resolved.

CHURCH-STATE RELATIONS IN COMPARATIVE PERSPECTIVE

Although the tension between the religion clauses of the First Amendment of the U.S. Constitution is a frequent source of confusion (as well as litigation), comparison with other Western democracies suggests that the combination of establishment and free exercise concerns may be fortuitous for the practice of American politics. Religion is a visible but hardly dominant force in political discourse in the United States, which provides multiple sources of transcendent values for political life.

By contrast, several other democracies provide government support for religious bodies (such as subsidies for schools or clergy salaries), which would be considered a violation of the establishment clause in the United States. Indeed, several European nations have legally established churches. Some analysts have suggested that this sort of governmental support results in a decline in religious membership and practice, since government support reduces the need for churches to attract support from members or potential members.

In other nations, such as France and Turkey, a policy of laicite constitutes attempts by the government to reduce or eliminate the presence of religion in the public life of the nation. In such settings, some religious adherents (especially those who identify with minority faith traditions) appear to experience divided loyalties between the demands of citizenship and discipleship. Religious behaviors (including such matters as clothing or the display of religious symbols) are frequent sources of social and political conflict in such nations.

Ted G. Jelen
CHURCHILL, WINSTON
1874–1965

Winston Churchill was a British politician, writer, and orator. He is best remembered for his opposition to the appeasement of Nazi Germany in the 1930s, for his inspirational leadership of the United Kingdom from 1940 to 1945, and for his warnings about the dangers of Soviet expansionism in 1946.

CHILDHOOD AND EARLY EXPERIENCE
Winston Leonard Spencer Churchill was born at Blenheim Palace in Oxfordshire on November 30, 1874, the eldest son of the Conservative politician Lord Randolph Churchill and his American wife, Jennie. His grandfather was the Seventh Duke of Marlborough and, despite his half American parentage, he had a very traditional British aristocratic upbringing, attending boarding schools from the age of seven at Ascot, Brighton, and Harrow. His behavior was often willful and rebellious and although his academic performance was not exceptional, when engaged he could show considerable ability. His passion was for the army, and in 1893 he was admitted to the officer training school at Sandhurst. The death of Lord Randolph in January 1895 had an enormous effect on the young Churchill, motivating him to prove himself as a worthy son.

Between 1895 and 1899 Churchill saw active military service in Cuba, India, and the Sudan. He used the periods between campaigns to improve his general education, and wrote up his military experiences as newspaper articles and books in order to earn fame and fortune. He was determined to enter politics and left the army to unsuccessfully contest the seat of Oldham in 1899. A few months later he became a war correspondent, covering the conflict between the British and the Boer republics in South Africa. He was captured, but managed to escape. This adventure made him an international celebrity and ensured his election to Parliament in 1900.

POLITICAL LIFE
Churchill began his political life as a Conservative. Yet when the Conservative Party began to move away from the policy of free trade toward one of tariff protection, Churchill refused to move with them and dramatically crossed the floor of the House of Commons to become a Liberal. He rose rapidly within his new party, becoming a government minister in 1908. The Liberal government introduced social change at home, while wrestling with increasing international tension abroad. Churchill was responsible for basic unemployment insurance and oversaw improvements in prison conditions. There were always clear limits to his radicalism. He was a strong opponent of socialism, took a tough line against industrial unrest, and opposed the campaign of the female suffrage movement.

By the outbreak of World War I in 1914 Churchill was the minister with responsibility for the British navy, a role he clearly relished. Unfortunately, his determination to bring the fleet into action led to his support for the disastrous Dardanelles campaign, during which attempts were made by British submarines to pass through the Dardanelles and disrupt Ottoman Empire shipping in the Sea of Marmara. Churchill lost his job, but after a brief spell in the trenches on the western front, was brought back as a member of Lloyd George’s national government, serving in a succession of government posts until the fall of the administration in 1921.

Churchill became increasingly concerned with the spread of communism abroad and socialism at home. He broke with the Liberal Party and rejoined the Conservatives, serving as chancellor of the Exchequer from 1924 until 1929. He was undoubtedly a great public figure but many regarded him as past his prime. A lifelong defender of the British Empire, Churchill was out of sympathy with mainstream political thinking over his opposition to greater independence for India. He found himself excluded from the national governments of the 1930s and was forced to spend time at Chartwell, his beloved home, writing history. From 1933 onward he became increasingly concerned by the threat posed to Europe by a revived militaristic Germany under Adolf Hitler’s national socialist regime, and was a vocal opponent of the Western powers’ policy of appeasement toward the fascist dictator. In the aftermath of the dismemberment of Czechoslovakia, public opinion shifted decisively behind Churchill and when Britain declared war on Germany in September 1939, Prime Minister Neville Chamberlain had no choice but to bring him back into the government as First Lord of the Admiralty.

POST AS PRIME MINISTER
Churchill became prime minister of a national government on May 10, 1940, the day that Hitler launched his blitzkrieg offensive against France and the Low Countries. The next few months saw him lead Britain during a period of crisis, when, following the collapse of France, Britain faced the threat of invasion and was subjected to the full onslaught of the German air force. Churchill’s great achievement was to imbue his administration and, through the power of his oratory, the wider British public with the will to resist. He turned himself into an iconic figure, with his trademark cigar, bow tie, and two-fingered “Victory” salute. Behind the scenes, he worked hard to
win increasing support from the United States. Following the German invasion of the Soviet Union and the Japanese attack on Pearl Harbor, he engaged in difficult shuttle diplomacy to build and sustain the Grand Alliance with Soviet political leader Joseph Stalin and President Franklin D. Roosevelt. His stature remained high, even as Britain’s war contribution paled beside that of the United States and Soviet Union. Put simply, his policy was to take the offensive and to strive for victory.

There is no doubt that Churchill expected to win the general election of 1945, but the Conservatives were defeated by the Labour Party, and he found himself out of office. He remained a major figure on the international stage, and in March 1946 he used his stature to warn of the dangers of Soviet expansionism in his famous “Iron Curtain” speech delivered at Fulton, Missouri. He also called for European reconciliation and spoke in support of the nascent United Europe movement. Not yet ready to retire from public life, he published his account of *The Second World War* (1948–1954) before winning a further term as prime minister in 1951. His policy was to call for summit discussions with the Soviet Union while building up Britain’s nuclear force and strengthening relations with the United States. Ill health finally forced his retirement in 1955. His reputation now secure, he published his *A History of the English-Speaking Peoples* (1956–1958). In the last two decades of his life he received many honors, including knighthood, the Nobel Prize in Literature, and honorary American citizenship.

Sir Winston Churchill died on January 24, 1965, seventy years to the day after the death of his father. He was given a state funeral and is buried in Bladon parish churchyard, within sight of his birthplace at Blenheim.

### BIBLIOGRAPHY

### CITATIONS

A citation is a reference to any published work as well as any form of communication with sufficient details to uniquely identify the item. When academics, scientists, and other professionals refer to any published work in their own published work, they cite it, giving the author, year, title, and locus of publication (journal, book, working paper, etc.).

In academia, according to the principle of meritocracy, scholars, departments, and institutions are evaluated through objective criteria. One of the main instruments used to measure the quantity and quality of academic output is citation analysis. A citation count is used as a proxy of impact, signaling quality, because it informs how often a given published work, author, or journal is cited in the literature. It allows us to build rankings of scholars, departments, institutions, and journals. These rankings are subjected to significant variations over time. For instance, in economics, only three journals—*American Economic Review*, *Econometrica*, and the *Journal of Political Economy*—appear consistently in the list of top ten journals of the profession during the 1970–1995 period (e.g., Laband and Piette 1994; Hodgson and Rothman 1999).

According to David Laband and J. P. Sophocles (1985), citations are the scientific community's version of dollar voting by consumers for consumption goods. Holding prices constant, consumers decide to buy goods from certain producers because of the quality of their merchandise. Whether the purchase decision is influenced by the buyer's friendship or family relationship with the seller does not matter. The relevant point is the volume of sales in which market shares are based. The same holds true for the consumption of scientific literature. What matters is the volume of citations, not the motivation behind each specific citation.
Any citation count has several dimensions. Among them, the sample of authors and journals, the time period in consideration, and self citations play an important role in defining the relative importance of an author, article, and journal.

In two papers in the journal *Science*, David Hamilton (1990, 1991) showed that about half of all science papers were never cited within five years after publication. David Pendlebury (1991) corrected the figures to show that “uncitedness” figures were 22 percent in the physical sciences, 48 percent in the social sciences, and 93 percent in humanities. Based on these figures, *Newsweek* concluded that “nearly half of the scientific work in this country is worthless” (p. 44), suggesting that resources invested in science are wasted.

According to Arjo Klamer and Hendrik van Dalen (2002, 2005), the skewed distribution of citations is part and parcel of what they call the *attention game* in science. Because there are too many articles for any scholar to pay attention to, she has to make a selection and usually follows others in doing so. There is a snowball effect in the sense that one scholar reads an article because others cite it; by citing it in her work, others may turn to the article as well. This is consistent with the reward system of science and in particular with the Matthew effects of science (Merton 1968) in which a few scientists get most of the credit and recognition for ideas and discoveries made by many other scientists. For instance, Diana Crane (1965) found that highly productive scientists at a major university gained recognition more often than equally productive scientists at a less prestigious university.

Besides the leadership effect described above, the number of citations may also be influenced by academic networks because of their positive externalities. Any scholar with a wide academic network can more easily communicate her work through seminar presentations, workshops, and conferences, and publish it in influential books, monographs, and professional journals. Another important source of citations related to academic networks is the relative importance of the scholar’s network. A scholar working in any given field who has access to leading professionals, departments, associations, and their respective publication venues may find it easier to be influential and therefore to be widely cited.

The number of citations increases with the number of publications or the type of journals in which a scholar publishes. João Ricardo Faria (2003) presented a model in which the scholar is assumed to maximize the success of her career as measured by the number of citations of her work. The scholar may choose to publish in top journals, which have a higher rate of rejection, therefore making the expected number of publications low; a scholar with these preferences is called a *K*-strategist. If the scholar chooses to publish in lesser-known journals with lower rejection rates, she ends up having many papers accepted for publication; in this case, she is an *r*-strategist. Faria showed that any scholar following either an *r* or *K*-strategy may achieve the same final amount of citations, and he conjectured that the most successful strategy is the one that combines both approaches to quantity and quality, a strategy called *Samuelson ray*. Samuelson ray is named after Paul A. Samuelson, because he has been one of the most productive and influential economists to date.

The number of citations to a scholar’s publications may vary over time with the quality of her work, the reputation of the journals where she has published, and the number of papers the scholar has published. Faria (2005) studied a Stackelberg differential game with scholars and editors. Journal editors are leaders who maximize the quality of the papers they publish, while the scholar is the follower willing to maximize the number of papers published, constrained by the way her work is cited. Faria showed that the number of citations increases with rules aimed at increasing a scholar’s productivity (i.e., tenure requirements) and with a journal’s reputation.

CITIES

The earliest cities were created more than 5,500 years ago in Mesopotamia. Those and other ancient cities were few in number and by twenty-first-century standards had small populations, primitive housing, and simple technology. However, cities brought enormous changes in human society. Over the years cities have existed, only a minority of the human population has lived in them; nevertheless, cities have been the locus of political, economic, cultural, and environmental changes that have transformed life on Earth.

URBAN TRANSFORMATION THEORIES

Scholars studying cities identify many significant transformations in them. This section summarizes five perspectives on these changes.

One perspective contends that city characteristics (i.e., high population density, diversity) cause city people to behave as they do. For example, increased occupational division of labor is associated with the shift from village to city. This important element of the urban transformation is usually explained by the French sociologist Emile Durkheim’s “dynamic density” principle: when many people try to survive in a concentrated area they specialize and refine the work they do to avoid direct competition with others, avoid redundancy, and improve the quality of their products or services. Similarly, cities are filled with strangers who have few preexisting bonds of loyalty, trust, or obligation. To enable them to better deal with each other, city life relies extensively on written contracts, laws, and courts to enforce them.

Likewise, Georg Simmel explained city-dwellers’ social behavior with inherent qualities of cities. He observed that compared to people from small towns, urbanites are reserved, blasé, aloof, calculating, more attuned to fashion, and engaged in “extravagances of mannerism and caprice” (Simmel 1969 p. 57). This, he argued, is because large cities are filled with people and things that generate a plethora of cacophonous, threatening, and contradictory images and messages. Urbanites’ traits previously mentioned are useful screening and coping devices they use to avoid those disconcerting stimuli and maintain a semblance of sanity and individuality.

Louis Wirth’s 1938 article “Urbanism as a Way of Life” epitomizes the notion that city characteristics produce a particular urban pattern of social life. He defined a city as “a relatively large, dense, and permanent settlement of socially heterogeneous individuals” (Wirth 1969, p. 148), and derived numerous social interaction patterns as consequences of population size, density, and diversity. Wirth proposed that in cities bonds of kinship and neighborliness weaken; tradition and familial authority attenuate and are only partially replaced by formal control mechanisms. Although individuals gain greater personal freedom and both social and spatial mobility are common, city residents’ social relations are segmented, impersonal, anomic, and imbued with “a spirit of competition, aggrandizement, and mutual exploitation” (Wirth 1969, p. 156). Wirth also indicated that as cities dominate their hinterlands, business corporations in them become more cut-throat and soulless, and cities’ subareas become “a mosaic of social worlds” (Wirth 1969, p. 155) with stark contrasts between nearby neighborhoods’ socioeconomic level, ethnic composition, housing, businesses, and land uses. Finally, Wirth suggested that in cities individual people count for little, have difficulty knowing how they fit in or what is really in their own best interests, and therefore they become susceptible to mass movements or charismatic leaders. Wirth’s portrait of urban life suggests that social problems and alienation are inherent elements of large modern cities.

Other perspectives, including Herbert Gans’ Urban Villagers (1962), contradict Wirth’s. One counter-response is a “rediscovery of community” perspective arising from many empirical studies in cities and suburbs. Together these studies suggest that the depersonalized, alienated, contract-driven urban world of attenuated local and familial bonds described above is an overgeneralization and is contradicted by the continued existence of tight-knit neighborhoods and strong group ties in parts of many cities.

This rediscovered community perspective claims Wirth’s “urbanism as a way of life” has not swept community from every corner of the metropolis. It contends that the kinds of people (i.e., their socio-economic level, life-cycle stage, ethnicity, sexual orientation, and socio-political values) living in a neighborhood has a greater effect on social life in it than does the place’s population size, density, and heterogeneity. Depending upon the kinds of people in an area (i.e., their needs and interests) they may work to create or maintain an active local community life, or they may let it languish and disappear. Also, community institutions preserve or build strong personal relations in city or suburban neighborhoods. Certain stores, religious institutions, “third places” (e.g., bars, coffee shops), or social clubs become the ground from which community ties grow. These are supplemented by per-
sonal networks such as those established in chain migrations to cities or by local community activists.

Another perspective on city life emphasizes underlying economic processes, inequalities, and the distribution of power. The key contention here is that the most powerful causal forces in a city are not inherent qualities of cities, but instead are conflicts of interests among the city’s economic classes, land ownership laws, and land use decisions that serve certain groups’ interests. The first analysis of urban poverty, Friedrich Engels’ mid-1840s study of working-class sections of England’s industrial cities, illustrates this perspective. Engels argued that neither of these cities’ two salient features—(1) huge differences in living conditions between a small upper class and a huge impoverished class of factory workers; and (2) disintegration of society into isolated individuals—is caused by anything inherent in large cities. Instead, he contended that these are produced by the capitalist economy, which causes brutal competition, exploitation, lowered wages, and unstable employment in these cities. Engels also said that the upper class controlled decisions regarding land use. This enabled them to arrange that cheap low-quality housing for workers is far from the better neighborhoods of the rich, guaranteeing the affluent would not have to see or be threatened by the squalor, unhealthy conditions, and misery of factory workers’ slums.

For much of the twentieth century the Engels/ Marxian perspective was eclipsed in urban studies by the influence of Wirth and an urban ecological perspective embodied in Ernest Burgess’s concentric zone model (and revisions by geographers’ sector and multiple nuclei models). It contended that in any era cities develop a characteristic socio-spatial structure produced by the era’s primary mode of transportation, construction technology, local topography, and, most importantly, economic competition for prime urban locations among individuals, groups, and businesses with unequal purchasing power. Segregation of immigrants and racial-ethnic minorities was attributed to a desire for living near others with similar culture and low economic standing, which prevents them from living in cities’ better neighborhoods.

By the 1970s the ecological perspective received criticism for the meager attention it gave to racism as causing urban racial ghettos and underestimation of the role of powerful government and private interest groups in making urban transportation and land use decisions. Researchers with critical perspectives developed explanations showing how cities are influenced by globalization, “growth machines,” “place entrepreneurs,” public-private partnerships, and institutionalized norms regarding gendered and racialized space. The city, in Mark Gottdiener and Ray Hutchison’s “sociospatial” perspective, no longer is the large dense dominant heart of the metropolitan area, where the skyscrapers, theaters, and museums are located; instead the city is a vast “multinucleated metropolitan region” containing dispersed centers and realms (e.g., “edge cities”) that perform most economic and cultural functions the central city once performed. In this perspective the strongest creators and modifiers of the new metropolis are government programs that subsidize suburbanization, real estate industries’ land use decisions, and cultural innovators (in architecture, design, advertising, or arts) who craft new forms, symbols, and desires for the metropolitan public.

MODERN CITIES AND THEIR PROBLEMS

Today’s largest metropolitan areas are in Asia and Latin America. Of the twenty with the highest populations, only New York, Los Angeles, Moscow, and London are in Europe or the United States. Since 1970 Asian and Latin American cities (Seoul, Shanghai, Mexico City, Sao Paulo) and African cities (Cairo, Lagos) have grown tremendously due to internal migration. Migrants pour in largely because governments’ and large corporations’ attempts at economic development disrupt local subsistence patterns in the countryside (e.g., conversion to capital-intensive agriculture, resource extraction). With insufficient housing and sanitation to absorb so many migrants, overcrowding and pollution are serious problems. Newcomers in rapidly growing Latin American and African cities have taken over land and created impoverished squatter settlements. Urban population growth outpaces these cities’ supply of jobs. This oversupply of workers causes low wages and results in enormous informal economies, with their attendant problems. Cities in Asia’s newly industrialized countries (e.g., Korea, Singapore) are marked by the development of global corporations engaged in manufacture, commerce, financial services, and technology. These businesses’ profitability and power enhance cities’ standing among world cities and turn sections of them into cosmopolitan centers. Moreover, their executives and white-collar workers expand the ranks of the cities’ upper and middle class and generate demand for goods and services provided by lower paid workers. Nevertheless, these mega-cities, like those of Latin America, remain places with a small middle class; huge gaps exist between the living conditions of the small privileged class and the poor population.

Cities in the United States face problems so severe that many observers believe they will never regain the prominence they had from 1900 to 1970. Due to suburbanization, initially by affluent whites and later by middle-class blacks and immigrants, only 30 percent of the U.S. population lives in cities. In many large cities most residents are African American or Latino, and often neigh-
Citizenship

Neighborhoods have highly concentrated poverty. With this demographic shift, political clout in legislatures moved from cities to more conservative suburbs. Old cities in the Northeast and Midwest deteriorated. With deindustrialization, many cities lost well-paying manufacturing jobs, which were not replaced with sufficient well-paying service industry jobs. City residents experienced high unemployment, cuts in city services, poor schools, and high crime rates. Older neighborhoods saw disinvestment by federal housing policy, which funneled money and new construction into white suburban areas, and by private lending and insurance companies, which “red-lined” city areas, making it more costly for families and businesses to move into or upgrade city neighborhoods. Ironically, federal programs that did make large investments (highway construction, public housing, urban renewal) in cities from 1950 to 1970 have been criticized as doing more to destroy than improve city neighborhoods.

Since 1990, many cities experienced some revitalization, population increase, and reduction in poverty concentration. Federal policy closing large public housing projects and creating mixed-income areas (HOPE VI) is partly responsible for this. Additionally, efforts by community development corporations (assisted by private foundations and city government) have improved housing and safety in some city neighborhoods. Revitalization also occurs with gentrification, as affluent people buy and renovate cheap housing close to the center of a city and then move in or sell to other affluent residents. While this process enlarges cities’ middle class and brings new businesses (improving the tax base), it can displace the less affluent. Where gentrification is extensive it reduces low-cost housing and can put the poor at greater risk of homelessness. Although the cities’ situation may not be as bleak as in the late 1980s, the problems are by no means resolved. In fact, many are appearing elsewhere, especially the older ring of suburbs near cities’ boundaries.

CITIZENSHIP

Citizenship can be succinctly defined in terms of two component features. First, it constitutes membership in a polity, and as such it inevitably involves a tension between inclusion and exclusion, between those deemed eligible for citizenship and those who are denied the right to become members. In its earliest form in ancient Greece, the polity in question was the city-state. In the modern world, it was transformed during the era of democratic revolutions into the nation-state. Second, membership brings with it a reciprocal set of duties and rights, both of which vary by place and time, though some are universal. Thus paying taxes and obeying the law are among the duties expected of citizens in all nations, while the right to participate in the political process in various ways—by voting, running for office, debating, petitioning, and so forth—is an inherent feature of democratic citizenship. This leads to a final point: citizenship exists only in democratic regimes, for in nondemocratic ones people are subjects rather than citizens. In this regard, there are three crucial features that characterize the democratic political system: (1) the right to participate in the public sphere; (2) limitations on the power of government over the individual; and (3) a system based on the rule of law, not the arbitrary rule of rulers.

The principal fault lines used to define the boundaries of inclusion versus exclusion have historically been based on three major social divisions: class, gender, and race. And, indeed, though much has changed, these divisions remain significant—and in fact tend to be intersecting. During the formative period of all the modern democratic regimes, beginning in the eighteenth century, the privileged white, property-owning male citizens were intent on disqualifying a majority of their nation’s residents from citizenship rights. Confronted with a disjunction between the egalitarian ideals of democratic theory and the desire to exclude from full societal membership certain categories of persons who did not share their class, gender, or racial identities, they responded by creating justifications for social exclusion. For their part, the white working class, women, and nonwhites responded, always

Charles Jaret
in difficult circumstances and with varying degrees of success, by creating social movements aimed at acquiring the political voice that had been denied them. The white working class had, by the late nineteenth century, succeeded in being included, though not as genuine equals. A similar inclusion would come slower for women and racial and ethnic minorities, where in many cases this did not occur until the later part of the twentieth century. Thus, American blacks did not overcome the barriers created by Jim Crow until the 1960s, Australia's Aboriginal population did not receive the right to vote until the same time, and in some Swiss cantons women did not acquire the right to vote until 1990.

As with inclusion, the development of the rights of citizens entails a dynamic process. Analyses of this process are generally framed in terms of the thesis advanced by the British social theorist T. H. Marshall, who distinguished between three types of rights: civil, political, and social. In his view, these types are distinct not only analytically, but also historically. Civil rights refer to such aspects of individual freedom as free speech, freedom of religious expression, and the right to engage in economic and civic life. Political rights involve those rights that ensure the ability to actively participate in the realm of politics. Finally, social rights involve the rights to various welfare provisions designed to guarantee to all a minimum standard of living necessary for the other two rights to be meaningful. Included are guarantees of educational opportunities, health care, decent and affordable housing, pensions, and so forth. Marshall thought that civil rights emerged in the eighteenth century, political rights in the nineteenth, and social rights in the twentieth, with the birth of modern welfare states. The historical record calls into question the unilateral depiction of the evolution of rights, but it is the case that all of the world’s liberal democracies did develop welfare states guaranteeing various forms of social rights. In his view, whereas the other types of rights do not challenge capitalism's production of unacceptable levels of inequality, social rights are intended to do so. Inequality does not cease to exist, but it becomes less consequential in shaping the life chances of individuals and impeding the goal of the equality of people qua citizens. The historical record indicates that welfare states have not actually managed to achieve this goal, and moreover, the neoliberal assault on the welfare state has resulted in an increase in levels of inequality.

Debates over the duties of citizens have pitted republican (and communitarian) theory versus liberal theory. The former position calls for an involved citizenry, while the latter is less inclined to ask or require citizens to be too actively engaged in politics. For example, republicans would be inclined to support universal conscription into military service or some alternative form of public service while liberals would not. Nevertheless, both positions believe that for democracies to succeed they need an informed and active citizenry. The distinction between the two traditions has much to do with differing perspectives on the levels of activity required. By the latter part of the twentieth century, a lively discourse emerged about the presumed tendency on the part of citizens in the United States, and to a somewhat lesser degree elsewhere, to withdraw from civic and political involvement, as evidenced, for instance, in the widespread interest in the Harvard political scientist Robert Putnam’s “bowling alone” thesis.

If in the past citizenship has been construed in terms of the individual, multiculturalism has raised the specter of the emergence of group rights. Although many, but not all, of the world’s liberal democracies have developed a multicultural sensibility, only two to date have implemented official state policies designed to promote multiculturalism: Canada and Australia. While some observers contend that the multicultural moment has ended, they fail to appreciate its novelty, specifically, as the scholar Jeffrey Alexander has argued, insofar as it signals a new form of civil society. Moreover, even without explicit multicultural agendas, there is evidence of a growing appreciation that difference and integration are not necessarily antithetical.

Finally, there is evidence of a growing interest in developments that suggest the world is entering a new era in which the nation-state’s monopoly on defining citizenship is being challenged. In part, this is due to the rapid expansion of people with dual or multiple citizenships and the growing willingness by governments to legalize or tolerate this situation. This increase is largely attributable to transnational immigration, which though not entirely new is more significant today due to new communications technologies and improved transportation networks. Whether or not transnationalism is largely a phenomenon of the immigrant generation, or will persist into the generations of their children and grandchildren, is an unanswered question in the early twenty-first century. Likewise, it is also unclear whether dual citizenship becomes merely formal, in which the citizenship of primary residence is the only salient one, or whether active involvements in two nations’ political systems persist.

Second, as exponents of postnationalist thought contend, supra-state entities such as the United Nations and the European Union (EU) are increasingly coming to assume some of the roles traditionally located solely with the nation-state. This is particularly the case with the issue of human rights, where there is evidence of the embryonic form of a global human rights regime. It is also relevant to environmental concerns, as the Kyoto Protocol makes clear, for these are matters that transcend existing political borders. Although the EU is unique, the fact that citizens of its member states can treat their social rights as apply-
The history of the city-state extends back to the ancient world and includes several ages in which it played particularly significant political roles. The first city-states developed among the ancient Sumerians in the lower part of Mesopotamia. Later, they became the fundamental political unit for the classical Greek civilization in the southern-most region of the Balkan Peninsula. During the medieval and early modern periods they were prominent in Italy and areas of Germany. However, with the rise of the modern nation-state, many city-states lost or gave up their political autonomy. Today, city-states continue to exist, but usually as isolated enclaves in a world of larger political entities.

Perhaps the best-known examples of the city-state are the ancient Greek poleis of Athens and Sparta. These two city-states were bitter military and political rivals, although there were instances of cooperation to repel Persian invaders. The political and cultural differences between the two are quite striking. Sparta was a militaristic state ruled by a mixed government combining monarchical, aristocratic, and democratic elements. Its citizens lived very austere, disciplined lives. Little attention was given to the arts. In contrast, Athens was the center of Greek culture, producing great works of architecture, art, literature, and philosophy. Among its citizens there was an appreciation of leisure and intellectual activities. The Athenian city-state is especially known for its development of a direct form of democratic government. All male citizens were allowed to participate in the assembly, and older (male) citizens were eligible to sit on the council.

Contemporary examples of city-states include Monaco, Singapore, and Vatican City. Monaco is a very small constitutional monarchy that borders the Mediterranean Sea on the southern coast of France near the Italian border. Even though it relies on France for military protection, Monaco continues to be a politically autonomous state. Singapore is an island state located between Malaysia and Indonesia. It was founded as a British trading colony in 1819 and became an independent city-state in 1965. Singapore is currently governed by a parliamentary republic. Vatican City is a tiny enclave located in the city of Rome. It gained political autonomy in 1929 and has maintained an ecclesiastical form of government, with the Pope serving as the chief of state. Italy is responsible for the defense of Vatican City, with the Pontifical Swiss Guard providing limited security within the city.

The city-state’s political significance has certainly waned in the contemporary world—it may even seem like an anachronism in the age of the large modern state. Nonetheless, the idea of a small, politically autonomous community can still have power over the political imagination; it can provide valuable inspiration for communi-

**CITY-STATE**

City-state refers to a sovereign political entity composed of an urban area and its surrounding territory. It can be usefully contrasted with country, which typically has a greater geographical expanse and larger population. Politically, city-states have been governed by a variety of regimes ranging from authoritarian to democratic. In many cases, they enter into formal or informal alliances with others because of economic or military interests, but they usually maintain their basic political autonomy. Culturally, city-states are often homogeneous. Their relatively small size limits diversity and facilitates a sense of commonality among citizens.

CIVIL DISOBDIEN
c

Civil disobedience is a form of sociopolitical protest consisting of the deliberate and intentional breaking of a law that is believed to be unjust. As John Rawls defines it in A Theory of Justice (1971 1991), civil disobedience is “a public, nonviolent, conscientious yet political act contrary to law usually done with the aim of bringing about a change in the law or policies of the government” (p. 320). It is marked by several distinctive and defining features. Firstly, to qualify as civil disobedience, such lawbreaking must be undertaken only after other legal and political avenues have been exhausted (or blocked repeatedly by civil authorities). Secondly, it must be done openly and in plain view of a wider public. Thirdly, the protesters’ reasons for breaking the law must be articulated and explained to that public. (Taken together, the second and third criteria are sometimes called the publicity requirement.) Fourthly, such disobedience must be nonviolent and cause no harm or injury to anyone other than the protesters (in the event that the authorities use physical force). And fifthly, the protesters must accept whatever punishment is meted out to them by civil authorities.

The term civil disobedience was coined by the editors of Henry David Thoreau’s posthumously published works. Apparently believing that Thoreau’s “Resistance to Civil Government” (1849) had a title that sounded too militant, they renamed his now classic essay “Civil Disobedience.” In that brief essay, Thoreau articulates and defends the idea that passive resistance is a right and duty of democratic citizens. To act in ways that cause “friction” in the “machinery” of injustice is not itself unjust; quite the contrary, Thoreau contends. In Thoreau’s own case, resistance took the form of refusing to pay taxes that would help support the extension of slavery into Mexican territory by means of the Mexican War. This led to his arrest and brief imprisonment.

Thoreau’s token act of resistance had little effect, but it led him to write the brief essay that has since been read, reread, and translated into dozens of different languages. “Civil Disobedience” has inspired dissidents and dissenters as varied as Leo Tolstoy in czarist Russia, Mohandas K. Gandhi in British-ruled India, Nelson Mandela and Steve Biko in South Africa, Andrei Sakharov in the Soviet Union, and Martin Luther King Jr. in the United States as well as Wei Jingsheng and the student protesters in China’s Tiananmen Square. In short, Thoreau’s little acorn of an essay has sprouted a forest of oaks.

Civil disobedience has both moral and practical aspects. The fundamental moral principles upon which civil disobedience rests are that it is unjust to accept or to turn a blind eye to injustice, that it is categorically wrong for one human being to harm another, that it is wrong to return harm for harm, and that it is better to suffer injustice than to act unjustly. To critics who claim that breaking the law is ipso facto unjust, defenders of civil disobedience reply that to obey an egregiously unjust law constitutes a “crime of obedience” (Kelman and Hamilton 1989). Moreover laws are made by human beings who are fallible and are capable of acting (or legislating) in unjust ways. If the law in question cannot be changed legally, it may be challenged extralegally and in nonviolent ways. As Rawls notes, in a perfectly just democracy, civil disobedience would be out of place, but that is not the sort of society in which we actually live. Therefore an almost just or imperfectly just democratic society that aspires to be just must make provision for civil disobedience (Rawls 1999, p. 319). By contrast, in an unjust and undemocratic society, more covert and clandestine forms of resistance may be undertaken and justified, as was the case with the pre–Civil War Underground Railroad that smuggled escaped slaves to freedom or the actions of those who during the Holocaust hid and protected Jews in defiance of Nazi law. Because such covert actions violate the publicity requirement, they do not count as acts of civil disobedience but fall instead under the heading of “conscientious refusal” (Rawls 1999, pp. 323–326).

Moving from the moral to the practical side of civil disobedience, its defenders maintain that to counter violence with violence only begets more violence, producing an ever-wider spiral of attack and counterattack.
vene nonviolently might initially provoke more violence, but over the longer haul, it helps break the spiral of violent action and reaction. On an equally practical note, bystanders who witness the suffering of civilly disobedient protesters may be moved to sympathize and side with their cause (as happened, for example, when fire hoses and fierce dogs were turned on peaceful civil rights protesters in the American South).

The theory and practice of civil disobedience holds that an individual or group should counter violence with nonviolence, hatred with love, injustice with justice. This is a most demanding doctrine and typically requires training in the tactics and techniques of nonviolence. It also requires, as King (1963) and others have pointed out, that we look for and appeal to the best in our adversaries. Civil disobedience requires not only that resisters rely on their own consciences but also that they act in ways that appeal to the consciences of those they act against as well as to the consciences of bystanders or witnesses. Because of this, acts of civil disobedience may, at least potentially, perform important and perhaps indispensable mobilizing and corrective functions for flawed and sometimes dysfunctional democratic societies (Power 1972; Ball 1972, chap. 4; Rawls 1999, p. 336).

CIVIL LIBERTIES

Civil liberties are individual freedoms intended to protect citizens from government. These freedoms include, but are not limited to, equal protection under the law, freedom of speech and association, religious freedom, and the right to a fair hearing or trial when accused of committing a crime. While many tend to use the terms civil liberties and civil rights interchangeably, civil liberties can be distinguished from civil rights in some fundamental ways. The primary distinction is that civil rights are protections by government against discrimination on the basis of individual characteristics like race, ethnicity, gender, or disability status, whereas civil liberties are most appropriately thought of as protections from government encroachment. Thus civil rights tend to require government action, while civil liberties are typically best served by government inaction.

Civil liberties are typically enumerated and guaranteed via the constitution of a nation-state but can also be guaranteed by other legal documents and conventions. One example of an enumeration of civil liberties that is not contained in a state's constitution is the International Covenant on Civil and Political Rights (ICCPR), a United Nations treaty created in 1966 and designed to protect civil rights and liberties globally. The ICCPR obliges nations who ratified it to protect individual liberties like freedom of speech, the right to a fair trial, and equal protection under the law via appropriate legislative, judicial, and administrative measures. Another example is the European Convention on Human Rights (ECHR), adopted by the Council of Europe in 1950. In addition to enumerating civil liberties and many civil and human rights, the ECHR established the European Court of Human Rights to adjudicate cases brought by individuals and groups who feel their rights under the ECHR were violated.

The United States is an example of a nation with constitutionally guaranteed civil liberties. In the U.S. Constitution, the most important protections for citizens against government imposition are set forth in the Bill of Rights, which are the first ten amendments to the Constitution. Additionally, in its capacity as the arbiter of disputes between government and the citizenry, the fed-
eral judiciary of the United States has slowly expanded the coverage of the Bill of Rights to include protections from state and local governments. This process is generally referred to as the nationalization or incorporation of the Bill of Rights, and occurred via expanded interpretation of the due process clause and the equal protection clause of the Fourteenth Amendment of the U.S. Constitution.

Though many governments profess civil liberties protections through various legal documents and conventions, it is not uncommon for these same governments to violate these protections and infringe upon the individual freedoms of their citizens, especially in times of crisis. For example, when national security concerns conflict with an individual’s right to privacy or protection from unlawful imprisonment, many governments privilege national security over civil liberties and are thus more inclined to commit violations. Because of some governments’ proclivity to infringe upon individual liberties, nonprofit organizations, such as Amnesty International, Human Rights Watch, and the American Civil Liberties Union, have been established with the missions of protecting and extending individuals’ rights and liberties and holding governments accountable for their encroachments.

CIVIL-MILITARY RELATION

The term civil-military relations denotes the field of social science inquiry that analyzes the relationship between the armed forces and society and/or the state. Since the state is often defined, following Max Weber, as the organ of society that holds the monopoly on the legitimate use of force, the relationship between formally constituted bodies of force and the state or society is a major indicator of the nature of that state. Indeed, in our own time the presence of independent military organizations or paramilitaries organized along political, sectarian, or ethnic lines and not answering to the command of a legitimate state testifies to the presence of the phenomenon of state failure in such countries as Iraq, the former Yugoslavia, Lebanon, and several sub-Saharan African states. Where all political power literally grows out of the barrel of a gun, the state and a legitimate political order are absent and anarchy, if not a war of all against all, reigns.

Alternatively, although the method by which the armed forces are subordinated to the executive and accountable to the legislative body varies in democratic states, the depoliticization of armed forces (including the police), their inability to take part in partisan politics, and their enforced accountability to legitimately elected organizations and heads of state testify to the democratic tendencies of the state. In these states, the use of force is under legal control, and ideally force can be employed only with legislative approval. In such a state the military similarly regulates itself by means of the internal rule of law (military law codes), which ensures that officers and soldiers are accountable for their acts. In the twentieth century and beyond, efforts have been made, beginning with the Nuremberg and other anti-Nazi trials, to extend that accountability to the international sphere, making commanding officers and even soldiers responsible to properly organized international tribunals for their acts.

Likewise in antidemocratic—that is, authoritarian—states, a critical signifier of the nature of the state lies in the sphere of civil-military relations. If the armed forces and police are divided into multiple overlapping forces with overlapping jurisdictions and the authority to monitor each other, this indicates that the legislature is weak and has been bypassed in its role of enforcing accountability. It entails as well the supremacy of the executive, which is above accountability to the legislature and its ability to exercise direct control over the armed forces through such multiple overlapping militaries. In such a state the military is politicized, a player in partisan politics, or else the means by which ambitious politicians seize power. Alternatively, a general or generals may decide to use the forces under their command, whether regular army, secret police, or some other force, to seize power for themselves. Here again the forms of such relationships among the executive, legislative, and military may vary widely among states. Nevertheless, these symptoms of authoritarianism and lack of legal accountability lead to the presumption of the existence of an authoritarian if not totalitarian state. And in totalitarian states, if not authoritarian ones, the

INTERNATIONAL ENCYCLOPEDIA OF THE SOCIAL SCIENCES, 2ND EDITION 547
primary function of the state is to prepare for war. Such states are frequently, if not always, organized for military action against either internal or external adversaries. In this case, not only are democratic controls over the armed forces absent but also war and a military ethos for the state administration are glorified. Even if a state is not militaristic in the sense of glorifying war, such regimes often promote a cult of so-called military virtues and discipline that should characterize the state administration.

This leads to the question of the relationship of the military to society. Crucial questions here are whether the soldierly is organized as a professional volunteer force or conscripted, the ethnic and religious composition of the armed forces, and the relationships among different armed forces, the police, and the military—or what in Europe is increasingly called the security sector. It also is critical to determine if the military and its commanders, as well as the police, can break criminal laws with impunity or whether they are truly subordinate and accountable to their country’s laws. This consideration obviously includes the extent of economic corruption and the ability simply to seize property by force, the latter being a sign of a demoralized military and a failing state. In this connection the field of civil-military relations also embraces the question of public support for the armed force and the image society holds of its members.

The public standing of the armed forces in any society is a good indicator of the nature of the relationship between that society and its armed forces. For all that the armed forces are trained specialists in the use and control of violence, they are recruited from society and cannot be artificially isolated from a society’s values or pathologies. Thus a society undergoing stress will find that stress translated into its armed forces, even if there is a lag between them.

The field of civil-military relations encompasses the entire range of relationships between the various forms and missions that armed forces take and the society and state that empowers them to act. It is an inherently comparative field because all states and societies have armed forces with which they interact. Indeed, the absence of either the state or the armed forces in the equation underscores the severity of a crisis for the community in question. Yet despite this inherent bias toward a comparative approach, each state and society relates uniquely to its own armed forces. The topicality of this relationship remains crucial to the understanding not only of our own state and government but to the broader world of international relations.

CIVIL RIGHTS

The term civil rights refers to equal treatment for individuals under the law. Political scientists Morris Fiorina, Paul Peterson, D. Stephen Voss, and Bertram Johnson define civil rights as “embody[ing] the American guarantee to equal treatment under the law—not just for racial groups, as people often assume, but more generally” (2007, p. 381). Civil rights are related to, but distinct from, civil liberties and human rights. In the American context, civil liberties are the freedoms granted to citizens in the Bill of Rights, the first ten amendments to the U.S. Constitution. These include, among other things, the freedoms of speech, peaceable assembly, and religion; protections against unreasonable searches and seizures, forced self-incrimination, and cruel and unusual punishment; and, for criminal suspects, the rights to a trial by jury and to representation by an attorney. These protections derive largely from the First, Fourth, Fifth, Sixth, and Eighth Amendments, all part of the Bill of Rights. Many other nations also grant both civil rights and civil liberties to their citizens through their constitutions or legislation.

Human rights are those rights that most scholars believe all human beings should have, regardless of which nation they live in. In 1948 the United Nations adopted the Universal Declaration of Human Rights, which declares that human rights include, among other things, rights to life, liberty, security, travel, property ownership, education, free thought and religion, work, rest, leisure,
and an adequate standard of living. The declaration also prohibits governments from certain practices, including torture and arbitrary arrest and detention. Human rights, then, are conferred not by individual nations, but by virtue of being human. Human rights may also be more broadly defined to include some rights outside the reach of both civil rights and civil liberties.

CIVIL RIGHTS AND DIFFERENT TREATMENT OF INDIVIDUALS

Civil rights derive from the U.S. Constitution, specifically the Fourteenth Amendment’s equal protection clause, which states that government cannot “deny to any person within its jurisdiction the equal protection of the laws.” In practice, government often draws distinctions between individuals, and the Fourteenth Amendment prohibits some, but not all, of these distinctions. When governments can treat people differently is a question often resolved by the courts. Some distinctions, such as race, are automatically suspect; the courts apply “strict scrutiny,” where government must demonstrate a “compelling state interest” and show there is no other way to pursue that interest. This test is very difficult to meet. In 1978 the Supreme Court prohibited a strictly race-based quota system for admitting students to the medical school at the University of California at Davis. In 1995 the Court prohibited a program that awarded municipal contracts to minority-owned firms on the basis of race.

Other distinctions, such as gender, receive “heightened scrutiny,” which is somewhat less demanding. Still, the courts often overturn government actions that treat men and women differently. In 1976 the Supreme Court overturned an Oklahoma law that established a drinking age of twenty-one for men but eighteen for women. And in 1996 the Court prohibited the state-run Virginia Military Institute’s policy of admitting only male students. Still other distinctions, such as age, are evaluated by the courts based on whether the government can show a “rational basis” for its action. For example, states seeking to place special restrictions on issuing driver’s licenses to people over seventy-five years old must only show that the state’s actions are reasonably related to promoting a legitimate government purpose. In short, the answer to the question “when can government treat individuals differently?” depends on the basis for classifying people.

CONSEQUENCES OF THE ABSENCE OF CIVIL RIGHTS

Civil rights are widely regarded as essential in democratic societies. The absence of civil rights would mean governments have few limits against enacting laws that enshrine unequal treatment by declaring some groups superior to others. American history provides many examples. The extreme racial segregation and discrimination against southern blacks between 1880 and 1965 resulted from the conviction among most southern whites that civil rights did not exist for blacks. Without civil rights, government could pass laws prohibiting blacks from holding certain kinds of jobs or requiring black and white schoolchildren to attend segregated schools, as many, mostly southern, states did before the Supreme Court prohibited segregated public schools in 1954. Without civil rights, government could not require that women be admitted to state-supported military academies, be allowed to practice the occupation of their choice, or even be allowed to hold checking accounts in their own name. Without civil rights, public buildings would not necessarily be accessible to the physically disabled, as the 1990 Americans with Disabilities Act requires. Without civil rights, governments would be free to declare same-sex sodomy (but not opposite-sex sodomy) illegal—as Texas and several other states did before the Supreme Court overturned such laws in 2003. Without civil rights, governments could pass restrictive immigration laws targeting people of certain national origins, denying them entry.

Guarantees of civil rights, then, protect people based on race and ethnicity, but also other factors, including nationality, gender, disability status, and sexual orientation. The presence of civil rights protects citizens against discrimination by their government, and often, by private action. The absence of civil rights opens the door to group-based domination, discrimination, and oppression, and would raise serious doubts about any society’s claim of upholding “liberty and justice for all.”

Civil Rights, Cold War

During the cold war, civil rights violations within the United States captured the interest of the world, causing many to wonder whether race discrimination undermined the nation's global leadership. How could American democracy be a model for the world to follow, peoples of other nations asked, when within the United States citizens were disenfranchised, segregated, and sometimes lynched because of their race? Discrimination was widely seen as the nation's Achilles' heel. In 1947, after violent attacks on African American World War II veterans in the South raised concern at home and abroad, President Harry S. Truman's Committee on Civil Rights issued a report which argued that the United States needed to improve its civil rights record, in part because race discrimination harmed U.S. foreign relations. By the late 1940s, the Soviet Union used racial discrimination in America as a principal anti-U.S. propaganda theme. Soviet propaganda was often exaggerated, but propaganda on race was particularly effective, simply because there was so much truth to it.

Global interest gave the civil rights movement international allies. In 1947 W. E. B. Du Bois wrote a petition for the National Association for the Advancement of Colored People (NAACP) to the new United Nations, "An Appeal to the World," to enlist U.N. support for the rights of African Americans. Du Bois, Paul Robeson, and others who criticized American race discrimination in an international context, lost their passports during the 1950s. Meanwhile, through the Voice of America and overseas information programs, the U.S. government tried to rehabilitate the image of American race relations, casting it as a story of enlightened progress under democracy. Some civil rights leaders, such as NAACP Executive Secretary Walter White, were staunchly anti-Communist and tried to aid the effort to convince peoples of other nations that African Americans could flourish in the United States, and that democracy was a better system of government than communism. Ultimately, however, American leaders believed that only civil rights progress would dampen the negative effect of racial problems on U.S. foreign relations.

In 1952 the Justice Department filed an Amicus Curiae brief in support of school desegregation in Brown v. Board of Education (1954), citing Secretary of State Dean Acheson as authority, and arguing that a crucial national interest was at stake in the case: foreign relations. When the Supreme Court ruled that segregation was unconstitutional, the decision was celebrated around the world. A challenge soon arose when Arkansas governor Orval Faubus blocked nine African American students from attending Little Rock's Central High School (1957). The Little Rock Crisis generated global criticism, and led jazz artist Louis Armstrong to cancel a State Department–sponsored trip to the Soviet Union; if "people over there ask me what's wrong with my country," Armstrong asked, "what am I supposed to say?" (Giddins 2001, p. 127). President Dwight D. Eisenhower, concerned with damage to U.S. foreign relations and other factors, sent in federal troops to escort the students into school. The world press lauded the president for putting the force of the U.S. government behind civil rights.

International interest gave the civil rights movement important leverage in the 1960s. The Nobel Peace Prize awarded to Martin Luther King Jr. in 1964 was one sign of global support. When Police Commissioner Eugene "Bull" Connor ordered fire fighters and police to use high-powered fire-hoses and police dogs on civil rights demonstrators marching in Birmingham, Alabama, in 1963, images of these violent tactics filled the world press. Domestic and international pressure led President John F. Kennedy to call for a strong civil rights bill. Passage of the Civil Rights Act of 1964 was celebrated around the world as a sign that the U.S. government was firmly behind civil rights reform. Formal legal change helped restore the image of America, even though inequities in American communities remained.

CIVIL RIGHTS MOVEMENT, U.S.

The civil rights movement in the United States is most commonly identified as the long-term effort to achieve legal, political, social, economic, and educational equality and justice for African Americans, especially the interval from 1954 to 1968.

ORIGINS OF THE CIVIL RIGHTS MOVEMENT

After Reconstruction ended in 1877, state and local governments in the South quickly enacted and enforced laws that required or allowed private racial discrimination and the racial segregation of public institutions and services. Other state laws circumvented the Fifteenth Amendment by using poll taxes, literacy tests, grandfather clauses, and white primaries to prevent blacks from voting. Collectively known as Jim Crow, these laws were unofficially enforced by the Ku Klux Klan, a white terrorist organization.

U.S. Supreme Court decisions also helped to legitimize Jim Crow laws and discourage renewed federal intervention. In the “Civil Rights Cases” of 1883, the Supreme Court struck down the Civil Rights Act of 1875. Congress did not pass another civil rights bill until 1957. In the *Plessy v. Ferguson* decision of 1896, the Supreme Court upheld a Louisiana law that required the segregation of railroad passengers. The court ruled that such segregation laws were constitutionally allowed under its “separate but equal” interpretation of the Tenth and Fourteenth Amendments.

In 1910 W. E. B. Du Bois (1868–1963), a black educator and writer, established the National Association for the Advancement of Colored People (NAACP). The NAACP Legal Defense and Educational Fund’s initial purpose was to promote civil rights for African Americans through court cases. This organization’s most famous legal victory was the Supreme Court’s unanimous decision in *Brown v. Board of Education* (1954). The *Brown* decision overturned *Plessy* and ordered the end of de jure racial segregation in public education. Thurgood Marshall (1908–1993), the association’s chief legal counsel in this case, became the first black Supreme Court justice in 1967.

Racial segregation and the disfranchisement of southern blacks continued during the 1950s and early 1960s. Most southern states refused to effectively implement the *Brown* decision. Southern governors such as George C. Wallace (1919–1998) of Alabama, Ross Barnett of Mississippi, and Orville Faubus of Arkansas exploited racial issues by dramatically resisting federal court orders to integrate public schools and state universities. Senator J. Strom Thurmond of South Carolina, who ran for president in 1948 as the nominee of the anti–civil rights “Dixiecrat” Party, tried to prevent passage of the Civil Rights Act of 1957 through a record-breaking filibuster. In major nonsouthern cities with growing black populations, African Americans experienced de facto segregation in public schools, as well as racial discrimination in housing, jobs, and customer service.

The civil rights movement became better known to Americans nationally because of televised news coverage of civil rights demonstrations in the South, especially those led by Martin Luther King Jr. (1929–1968), a black minister in Alabama. There was also national media coverage of President Dwight D. Eisenhower’s (1890–1969) use of the U.S. Army to enforce racial integration at a high school in Little Rock, Arkansas, and the racially motivated murders of fourteen-year-old Emmett Till in Mississippi in 1955 for allegedly whistling at a white woman, and of three civil rights activists in Mississippi in 1964.

Organized as the Southern Christian Leadership Conference (SCLC), King’s movement attracted white legal, financial, and political support from throughout the nation. Influenced by the nonviolent civil disobedience of Mohandas K. Gandhi (1869–1948), King’s first success in defying and ending racial segregation was the Montgomery, Alabama, bus boycott of 1955 to 1956. After Rosa Parks (1913–2005), a black seamstress, was arrested for violating the segregated seating of bus passengers, King led a boycott of local buses, which forced the end of segregated bus seating in Montgomery. The Montgomery bus boycott inspired similar peaceful protests elsewhere in the South, such as the sit-in protests by black college students seeking service at lunch counters and the Freedom Riders seeking to racially integrate Greyhound buses and passenger facilities on an interstate basis.
Many of the participants in the Freedom Rides and the voter registration project in Mississippi during the summer of 1964 were members of the Student Nonviolent Coordinating Committee (SNCC) and the Congress of Racial Equality (CORE). SNCC and CORE were also prominent in organizing King’s August 1963 March on Washington. Earlier, in his “Letter from a Birmingham Jail,” King expressed his exasperation with people who urged caution and patience in his incessant yet peaceful quest for civil rights and justice for African Americans.

Malcolm X (1925–1965) was the most militant and prominent critic of King’s pacifism. Malcolm X, a black Muslim religious and political leader based in New York City, asserted that African Americans should reject pacifism and arm themselves for protection against whites. He also rejected racial integration in a white-dominated society and urged the development of black separatism in order to promote economic independence and an African-based cultural identity among blacks. Although Malcolm X was murdered by rival black Muslims in 1965, his influence on the civil rights movement persisted in the formation of the Black Panthers and King’s later opposition to the Vietnam War (1957–1975), his linkage between racial justice and economic justice, and his increased activism on racial issues in northern cities, especially Chicago.

The most significant national legislative accomplishments of the civil rights movement were the Civil Rights Acts of 1964 and 1968 and the Voting Rights Act of 1965. The Civil Rights Act of 1964 prohibited racial discrimination in public accommodations, public facilities, employment, and the use of federal funds. The Voting Rights Act of 1965 authorized the federal government to register voters and supervise elections, prohibited literacy tests, and expressed opposition to poll taxes. The most controversial provision of the Civil Rights Act of 1968 prohibited racial discrimination in the sale and rental of housing.

**THE LEGACY OF THE CIVIL RIGHTS MOVEMENT**

After the assassination of King in 1968, the further advancement of civil rights for African Americans became more controversial among whites as they associated the civil rights movement with black militancy, affirmative action, and court-ordered busing to racially integrate non-southern schools. Nevertheless, the black civil rights movement inspired other civil rights movements in the United States, especially those for women, gays, opponents of the Vietnam War, and Latinos, the latter led by César Chávez (1927–1993) and the United Farm Workers of America.

**CIVIL SOCIETY**

Civil society (from the Latin *civili societas*) is the realm of independent activity and voluntary association that is not organized by the state. The origin of the term is often traced to the Scottish Enlightenment philosopher Adam Ferguson (1723–1816) and his *Essay on the History of Civil Society* (1767). Ferguson saw the new commercial civilization then displacing the older clan-based feudal order of the Scottish Highlands as enhancing individual liberty through the introduction of “civil society,” “civil life,” and “economic society.” In the same intellectual tradition, another Scottish Enlightenment philosopher and social theorist, Adam Smith (1723–1790), referred to the notion of civil society as the capacity of human communities for autonomous self-organization. For both Ferguson and Smith, the example of the free, self-regulating economic market demonstrated the possibility of social organization without the heavy-handed supervision of the state.

But it was the German idealist philosopher Georg Wilhelm Friedrich Hegel (1770–1831) who first drew the boundary between the spheres of state and society in his *Elements of the Philosophy of Right* (1820). For Hegel, civil society (*bürgerliche Gesellschaft*) was the realm of the particular counterposed to the state. It occupied the mesolevel (or intermediate stage) between the dialectical opposites of the macrocommunity of the state and the
microcommunity of the family. In his view, civil society was a temporary mode of relations interposed between the individual (or the family) and the state, which was to be transcended when particular and common interests combined.

There are several competing definitions of what the concept of civil society involves. For some writers, like the French Enlightenment philosopher Charles Louis de Montesquieu (1689–1755) and the French social commentator Alexis de Tocqueville (1805–1859), civil society was the realm of intermediate associations that stood between the individual and the state. It includes social and economic arrangements, ethical and legal codes, contractual obligations, and institutions apart from the state, but its key attribute is that it refers to public life rather than private or household-based activities. Civil society is juxtaposed to the family and the state and exists within the framework of the rule of law, accepting a certain commitment to the political community and the rules of the game established by the state. Most writers in this tradition seem to have in mind the domain of public participation in voluntary organizations, the mass media, professional associations, labor unions, social movements, and the like. In their writings, civil society becomes a description for all nonstate aspects of society, including the economy, culture, social structures, and even politics.

Other thinkers, like the Swiss-born Enlightenment philosopher Jean-Jacques Rousseau (1712–1778) and the German social theorist and revolutionary Karl Marx (1818–1883), tended to be more critical of civil society, which they saw as an economic and social order, developing in accordance with its own rules and independently of the state. In this conceptualization, civil society meant the social, economic, legal, and ethical arrangements of modern, industrial-capitalist society considered apart from the state. The concept generally referred to the specific mode of relations between the state and self-organized social groups which was first attained by the modern European nations, although its seeds can be found in earlier periods. While praising civil society, which is voluntarily formed by the citizens as a sphere of social self-organization between the private realm of the domestic and the state, Rousseau (1762) recognized that civil society can be plagued by evils such as social injustice, elitism, and economic inequality that contradicted his idea of the “general will” of the entire citizenry (volonté générale). While Marx stressed the economic character of civil society in the fashion of Ferguson and Smith, he viewed it as an expression of crass materialism, brutal exploitation, anarchic competition, and economic inefficiency (Marx 1843). According to him, civil society was a morally decadent, oligarchic society rife with greed, egoism, individualism, and alienation that benefited only the privileged class of the “bourgeoisie” (that is, the wealthy owners of productive capital) who lived off the labor of the rest of society, especially the industrial working class (the “proletariat”).

For the prominent Italian Marxist theorist Antonio Gramsci (1891–1937), civil society was the bastion of “hegemony” by the economically dominant “bourgeois” class. In contrast to Marx, he defined civil society as a predominantly cultural and ideological sphere rather than an exclusively economic domain. He argued that in the developed capitalist countries, the state has close institutional and ideological links with civil society, in which the “active consent” of the mass public is manufactured on a daily basis. Public consent is not achieved through political democracy but through ideological hegemony—that is, propaganda, indoctrination, public education, and the inculcation of a worldview biased in favor of the socially and politically dominant class. Therefore, civil society is ultimately supportive of the “bourgeois” state, which uses it to shape popular beliefs and aspirations in its own ideological image (Gramsci 2001).

Today the study of civil society focuses on the causal link between democratization and the nonpolitical aspects of the contemporary social order, leaving open to debate the question of whether or not there is incongruence and conflict between civil society and the state. The existence of a self-organized, vibrant, and fully developed civil society that is free of the state and has numerous autonomous public arenas within which various voluntary associations regulate their own activities and govern their own members is a necessary, but not sufficient, condition for a viable democracy and the transition from an authoritarian or totalitarian regime to a democratic one. Civil society discourse has more recently drawn on the experience of the collapse of communism in Eastern Europe, where the anticomunist opposition embraced the revival of civil society as its raison d’être during the years leading up to the revolutions of 1989. In fact the downfall of communism has often been linked theoretically to the revolt of residual or nascent civil society against the political intolerance and ideological rigidity of the communist state.

BIBLIOGRAPHY
A third salient pattern in the recent wave of civil wars is that once a nation experienced one civil war, it was very likely to experience a second one. The 108 civil wars in the Correlates of War data set occurred in only fifty-four nations. Only twenty-six of those nations had one and only one civil war, while the remaining twenty-eight nations had at least two and as many as five separate civil wars. Thus, for a certain subset of nations, civil war is a chronically recurrent condition.

One encouraging trend to emerge since the end of the Cold War is the willingness of the international community to broker negotiated settlements to civil wars and to support those settlements with peacekeeping forces. Nineteen of the twenty-six civil wars that ended in negotiated settlements were resolved after 1988, including United Nations (UN)–mediated settlements to protracted civil wars in Cambodia, Mozambique, and El Salvador, to name but a few. Not all of these peace settlements have lasted: the peace established by settlement agreements in Angola, Colombia, and Lebanon, for example, later broke down into renewed civil war. However, when negotiated settlements are supported by UN peacekeeping forces, the resulting peace has proven to be rather durable (Fortna 2004; Doyle and Sambanis 2000).

FORMS OF CIVIL WAR

The term civil war is used to describe organized armed conflict between the armed forces of a sovereign state and one or more rebel organizations drawn from the population of that nation. Two subtypes of civil war can be distinguished: revolutions and secessionist revolts. In a revolution, the rebels seek to overthrow the existing government and assume control of the state themselves. Civil wars in Nicaragua (1978–1979), El Salvador (1979–1992), and Cambodia (1970–1975, 1979–1991) are examples of revolutionary civil wars. In a secessionist revolt, the rebels seek not to take over the existing state but to gain independence from it by creating a second sovereign nation-state out of a portion of the territory of the original nation. The Tamil revolt in Sri Lanka that began in 1983, the Eritrean revolt against Ethiopia (1974–1990), and the Biafra revolt in Nigeria (1967–1970) are examples of secessionist revolts.

A further distinction among civil wars concerns whether they are ethnic conflicts or not. Among revolutionary civil wars, those that are nonethnic or ideological typically involved peasant-based insurgencies in nations where the agricultural sector dominates the economy. Where land ownership is concentrated in the hands of a small landed elite, the large peasant majority is often relegated to a life of poverty as landless or land-poor cultivators. When an authoritarian state employs repression to preserve the prerogatives of the landed elite against peasant-based dissident movements, revolutionary insurgencies can arise by drawing support from landless and land-poor peasants. The civil wars in El Salvador, Peru, Colombia, and Guatemala followed this pattern.

In ethnic conflicts, the same issues of inequality and repression generate the grievances that motivate rebels and
their supporters. However, ethnicity adds another dimension to the conflict between state and society. In ethnic revolutions, ethnicity and inequality often coincide: those who are victims of various forms of inequality are from one ethnic group, while those who enjoy a disproportionate share of the advantages available in the nation are from a different ethnic group. Ethnic divisions add cultural and identity issues to the fuel of conflict. Members of one ethnic group fear the suppression of their culture, language, religion, and heritage at the hands of a regime dominated by a rival ethnic group. Where ethnic groups out of power are concentrated in geographic enclaves, their response to this ethnic security dilemma is often to launch a secessionist war aimed at establishing their homeland as a separate sovereign nation. The Eritrean secession from Ethiopia fits this pattern. Where ethnic groups are more intermixed geographically, groups out of power often resort to revolutionary violence in an attempt to overthrow a state dominated by their ethnic rivals and to establish themselves in power. The ethnic revolutions in Angola and Rwanda fit this pattern.

CAUSES OF CIVIL WAR

The observable patterns of conflict discussed earlier provide some clues as to the factors that make a nation more or less susceptible to the outbreak of civil war. The fact that until 1991 almost all civil wars occurred in third world nations suggests that factors common to third world nations but not postindustrial democracies or former Leninist regimes might be implicated in the causal process leading to civil war. One such feature is that almost all of these nations were at one time colonies of European powers. Colonial powers harnessed the economies of these regions to serve the demands of markets in Europe and North America. In so doing, they disrupted existing patterns of agricultural production for local markets, as well as the patterns of community organization that supported that production and provided indigenous communities with reliable survival strategies (Migdal 1988).

Decolonization may have conferred formal sovereignty on former colonies, but rarely did the departing colonial power endow the postcolonial state with the institutional capacity or economic wherewithal to develop a strong and effective state capable of providing its constituents with civil order and a reasonable level of material well-being. Lacking legitimacy based on effective performance, weak states came to perceive any dissident challenge—peaceful or otherwise—as a threat to the state itself. The weak state responded with the one policy instrument at its disposal: military repression. Repression forced challengers to resort to violence of their own in order to advance their claims and defend themselves against the state. This cycle of violence begetting violence often escalated to civil war.

Empirical research on predictors of civil war onset provides support for the proposition that the weak state syndrome described above is associated with susceptibility to civil war. A number of correlates of the weak state syndrome consistently distinguish nations that experience civil war from those that do not. Not surprisingly, civil wars are more likely to occur among nations that have lower levels of economic development (Fearon and Laitin 2003; Collier and Hoefller 1998). Where poverty is widespread, the opportunity costs of participating in armed rebellion are lower: participants have less to lose by joining an armed rebellion than would be the case were they more prosperous. Rebel recruiting is facilitated by low levels of economic well-being (Collier and Hoefller 1998). Economic underdevelopment also constrains the capacity of the state to respond to dissident movements with accommodative reforms that might defuse tensions short of armed conflict.

Other dimensions of state strength affect a nation’s susceptibility to civil war as well. Although the evidence is mixed, there is some support for the proposition that both democracies and autocracies are less likely to experience civil war than weak authoritarian regimes (Henderson and Singer 2000; Auvinen 1997; Hegre et al. 2001). The institutions of democracy provide aggrieved groups with an alternative to violence as a means to seek redress of their grievances. Elected leaders have an electoral incentive to address those grievances with accommodative policies, and they risk electoral costs if they respond with repression. Highly autocratic regimes are also relatively immune to civil war because the overwhelming coercive capacity of such states precludes armed uprisings by repressing dissent preemptively.

It is the weak authoritarian regimes (anocracies) or nations undergoing the transition to democracy that are the most susceptible to civil war (Hegre et al. 2001). They lack both the institutional capacity to resolve popular grievances through accommodative policies and the coercive capacity to repress dissent preemptively. When faced with a dissident challenge, such regimes attempt to repress it but fail, confronting dissidents with the choice of withdrawing from politics and suffering in silence or adopting violent tactics of their own to overthrow the incumbent regime.

HOW CIVIL WARS END

One feature of civil wars that has drawn considerable attention recently has been the question of their duration (how long they last) and their outcome (whether they end in a government victory, a rebel victory, or some sort of negotiated settlement). Civil wars do tend to last longer...
than interstate wars: the 108 civil wars described in the
Correlates of War lasted an average of 1,665 days, whereas
the twenty-three interstate wars lasted only 480 days on
average. Because civil wars have lasted so long, new civil
wars began at a faster rate than ongoing wars ended (until
about 1994), with the result being a relentless accumu-
lation of ongoing civil wars (Fearon 2004). The long dura-
tion of civil wars also accounts for their destructiveness.
The rate at which casualties occur is usually lower in civil
wars than in interstate wars; interstate wars are, on aver-
age, more intensely destructive. However, because civil
wars last so much longer than interstate wars, their cumu-
lative death toll usually exceeds that of interstate wars.

The duration of civil wars also affects their outcome.
There is evidence that military victories by either the gov-
ernment or the rebels usually occur fairly early in the
conflict if they occur at all. For rebel movements especially,
the evidence suggests that if they are going to win, victory
will occur within the first two or three years of the con-
lict. Governments, too, tend to win early if they win at all
(Mason et al. 1999). Past some point (about eight to ten
years into the civil war), neither side is likely to achieve
military victory, and they settle into what William
Zartman has termed a mutually hurting stalemate (1993, p.
24), whereby neither side has the capacity to defeat the
other, but both sides have the capacity to deny victory to
their rival.

It is at this point that civil wars become ripe for reso-
lution. Third-party mediation—usually by the United
Nations—can bring about a negotiated settlement to the
conflict. While negotiated settlements are more likely
than military victories to be followed by renewed conflict
(Licklider 1995), negotiated settlements supported by
UN peacekeeping forces are more likely to last (Fortna
2004; Doyle and Sambanis 2000). Peacekeepers provide
both sides with credible guarantees that they can disarm
and demobilize without fear of their rival violating the
agreement and achieving through deception what they
could not achieve on the battlefield (Walter 2002). Data
from the UN’s Department of Peacekeeping Operations
indicate that forty-seven of the sixty peacekeeping opera-
tions established since 1945 have been deployed in civil
wars, and forty-three of those were deployed after the cold
war ended. Thus, UN brokering of peace agreements and
deployment of peacekeeping forces have brought about a
decline in the frequency, duration, and deadliness of civil
wars, developments that offer some hope for future trends
in the frequency, duration, and destructiveness of civil war.

CIVILIZATION

A Latinate word civilization ranks among the master concepts in the history of modernity. As such, it bears enormous semantic and historical density and has important relations with other master concepts of the modern, such as history (in the modern sense of a collective singular totality), progress, development, culture (in both the high and low senses), and modernity itself. The earliest recorded use of the term civilization in English dates from the first decade of the eighteenth century, though it appeared in a strictly legal context, referring to the conversion of a criminal matter to a civil one; this meaning is now obsolete (even as a juridical dimension extends into present usage). In its relevant modern sense, civilization was established in the second half of the eighteenth century—especially in the wake of the French Revolution (1789–1799)—and was further consolidated through the nineteenth century as a comparative and hierarchizing metaphistorical, meta-anthropological concept. The term has since experienced a complex trajectory, shot through with ethico-political critique (a related concept that emerged in the nineteenth century), extending from circa 1500 onward, includes: colonialism (co-emergent with the Renaissance, but accelerating from the second half of the eighteenth century through the nineteenth); the intensification of urbanization and the eventual emergence of major European capitals; the interrelated processes of the marginalization of the Catholic church in the European state system, the emergence of Protestant sects, and the spiritualization of strands of Christian theology; the monopolization of violence by the absolutist state, and the related development of courtly manners; the achievement of a law-governed European inter-state system (first through the 1648 Treaty of Westphalia, and then the 1815 Congress of Vienna); the spread of disciplinary institutions and technologies of the self; the global rise of European capital, and the correlative emergence and consolidation of European bourgeois classes and consumerism; the development of private property from the late seventeenth century and accelerating from the second half of the century (e.g., in England with the enclosures movement); the interrelated development of parliaments, national polities/states, and electoral democracy (beginning in the seventeenth century in England for the propertied classes and extending both horizontally and vertically throughout the eighteenth, nineteenth, and twentieth centuries to universal adult franchise, excluding the non-European colonies); and of course the development of the arts, sciences, and technology, especially at an accelerated pace since the Enlightenment (i.e., roughly the eighteenth century).

Thus, the significations accruing to civilization have been the following: European/Western; urban and urbane; secular and spiritual; law-abiding and nonviolent (i.e., limited to legalized violence, both within and between states); polished, courteous, and polite; disciplined, orderly, and productive; laissez faire, bourgeois, and comfortable; respectful of private property; fraternal and free; cultured, knowledgeable, and the master of nature. The uncivilized conversely are: non-Western; rural, or worse, savage; idolatrous, fanatical, literalist, and theocratic; unlawful and violent (i.e., given to violence outside juridical procedure); crude or rude; lazy, anarchic, and unproductive; communistic, poor, and inconvenient or beleaguered; piratical and thievish; fratricidal (or, indeed, cannibalistic) and unfree; uncultured, ignorant, illiterate, superstitious, and at nature’s mercy. Given this stark set of binaries, it is not surprising that the civilizing mission (a related concept that emerged in the nineteenth century) has often been the ideological counterpart of projects of colonial domination and genocide, especially in the non-Western world, but also in the European hinterland and vis-à-vis European minorities and subaltern classes.

Marginal to the main thrust of the concept’s history, critiques of civilization have accompanied it throughout, from Jean-Jacques Rousseau (1712–1778) in the mid-eighteenth century through Romanticism to anarcho-primitivist strands in the contemporary antiglobalization movement (Zerzan 2005). These critiques, especially in
Civilization

German lands in the nineteenth century (Elias 2000), have often relied on the concept of culture as a more local, authentic, egalitarian, and communitarian alternative, though just as often culture has been co-opted by nationalist projects. There is ultimately much slippage between culture and civilization. This slippage is evidenced in Samuel Huntington’s much discussed book, The Clash of Civilizations and the Remaking of World Order (1996), where the concept of civilization appears to be just culture on a grand scale—which is moreover decoupled from the now largely archaic concept of civility: Would it be possible to imagine a “clash of civilities”?

The first recorded use of the word civilization in its relevant, modern, as opposed to the archaic juridical sense, points toward another semantic element that has received remarkably little attention given its extraordinary significance. It is now accepted that the term was first used in 1756 in Lami des hommes (The Friend of Man) by Victor de Riqueti (1715–1789), the marquis de Mirabeau, an important physiocrat. In this work, Mirabeau asserts: “Religion is without doubt humanity’s first and most useful constraint; it is the mainspring of civilization” (cited in Mazlish 2004, p. 5). The close association in Mirabeau between religion and civilization (at a time when the term religion was all but synonymous with Christianity, non-Christian peoples being found to be either lacking religion, or possessing more or less pale approximations or deviations of Christianity) surprises only because of the inherited dogma that the civilization process coincides with the vanishing of religion (in which direction the first step is the avowed rationalization of religion, that is, the emergence of the Protestant sect). In fact, civilization has been coupled with Christianity and (Western) Christendom throughout its career (Perkins 2004), and missionaries have been key and continuing agents of the civilizing mission. Even today, a measure of merely the iceberg’s tip in this regard is the character of debates on the accession of Turkey to the European Union, as well as the statements of prominent Western opinion makers and leaders in the wake of the events of September 11, 2001 (most explicitly U.S. president George W. Bush and Italian prime minister Silvio Berlusconi). Even in high scholarship, an important sociologist of religion, Rodney Stark, published a book in 2005 under the title The Victory of Reason: How Christianity Led to Freedom, Capitalism, and Western Success.

Given the historicist character of civilization, this coupling is inevitable: If civilization arose, or developed its standard form, in Christendom, how can the latter not continue to be credited and effectively associated with its achievement? Relatedly, if secularism (an important constituent of civilization) emerged out of the Protestant Reformation—as is frequently avowed, especially in the United States—how can the latter not be so accredited and effectively linked? The same can be said for the originary relationship between capitalism and civilization, a view registered in the cold war perception of the Soviet Union as an example of barbarism and “Asiatic despotism.” This view is no doubt also indebted to the shifting cartography of the “uncivilized” Orient, which has often extended into eastern Europe (or even central Europe, as during the Third Reich), not to mention the enduring if older legacy of the secession of the Eastern Church from Rome.

In charting the trajectory of civilization, contemporary scholars often index and discuss attitudes of superiority in premodern and non-Western contexts (e.g., the old Chinese binary of “kaihualwenming versus fan,” which roughly corresponds to “civilized versus barbarian”). But it is important to keep the following in mind: It is no doubt the case that all human collectivities have ways of distinguishing themselves from others, and this process takes on an increasingly hierarchical accent in large stratified collectivities. With stratification, moreover, come concepts that discriminate between members of various levels and groups within. However, both the flexibility and form of the inside-outside distinction, as well as the forms of internal hierarchy, vary widely, and are in each case specific, even if dynamic. For the exercise to have any meaning, therefore, it is critical that analysis stays with this specificity. The surest guide in this regard is the material language of the concept in its discursive trajectory, that is, the Latinity of civilization. Furthermore, the non-Latinate analogs that have emerged since the mid-1800s (e.g., the Japanese bunmeikaika, coined circa 1880) are translations carried out in a highly asymmetrical historical context dominated by the Latinate, and are thus both defensive and derivative. Indeed, the force of Eurocentric civilizational discourse has been such that anticolonial ideologies have attempted to claim the origins of “civilization” for themselves, as in the Afrocentric scholarship of Cheikh Anta Diop. However, if other conceptions of civilization did hold out some hope in the first half of the twentieth century, as anticolonial movements highlighted the inconsistencies between the theory and practice of European civilization, and attempted to imagine alternatives—exemplified by Mohandas Gandhi’s (1869–1948) famous quip about Western civilization that “it would be a good idea”—at the beginning of the twenty-first century, civilization appears to function as the master concept for the legitimation of elites everywhere.

CIVILIZATIONS, CLASH OF

The “clash of civilizations” is a thesis that guides contemporary social science research in a comparative and global perspective. It is also a concept frequently used in political and public discourse, especially regarding the relationship between the “West” and Islam. This entry is intended to provide readers with an understanding of the origins and meaning of the clash of civilizations, selected research pertinent to this thesis, and a critical examination of this thesis and research.

Although historian Bernard Lewis had used the term earlier, the political scientist Samuel P. Huntington popularized the “clash of civilizations” in a highly influential 1993 article in the journal Foreign Affairs and in a bestselling book, The Clash of Civilizations and the Remaking of World Order (1996). In these works, Huntington puts forth the clash of civilizations thesis in an attempt to explain the causes, character, and consequences of divisions among people and between states after the collapse of Eastern European Communism in the late twentieth century. The thesis combines historical insights with contemporary developments, such as the increasing importance of religion and the rise of religious fundamentalism.

Huntington writes, “the most important distinctions among people [today] are not ideological, political, or economic. They are cultural” (1996, p. 21). “The most important groupings of states are no longer the three blocs of the Cold War,” Huntington further asserts, “but rather the world’s seven or eight civilizations” (1996, p. 21). These civilizations contain all of the elements of culture, such as language, history, identity, customs, institutions, and religion, but the clash of civilizations thesis holds that religion is the major fault line. Accordingly, the world’s people and states are classified into the following civilizations, largely on the basis of their religious traditions: Sinic (Chinese), Japanese, Hindu, Islamic, Orthodox, Western (Christian), Latin American, and “possibly,” African. As evidence in support of this thesis, Huntington points in his 1993 article to fighting among (Western Christian) Croats, (Muslim) Bosnians, and (Orthodox) Serbs in the former Yugoslavia, U.S. bombing of Baghdad, and the subsequent negative Muslim reaction. Furthermore, Huntington predicts, “the next world war, if there is one, will be a war between civilizations” (1993, p. 39). The most dangerous civilizational conflicts, from Huntington’s perspective, will arise from Western arrogance, Muslim intolerance, and Sinic assertiveness.

In the wake of the September 11, 2001, attacks, the global “war on terror,” and the U.S.-led invasion of Iraq in 2003, social scientists increasingly turned their attention to Huntington’s claims of an Islamic-Western clash of civilizations. The main controversy centers on whether religious traditions, such as Islam, are impediments to democracy. In fact, Muslim countries (e.g., Saudi Arabia, Iran, and Pakistan) are more likely than Western countries (e.g., the United States, most of the countries in the European Union, and Australia) to have authoritarian regimes in which citizens have little or no say in government. From Huntington’s perspective (1996), this is because Western Christianity emphasizes democratic pluralism, separation of religion and state, rule of law, and individual rights to a greater extent than Islam: Islamic tenets hold that God rules the universe; there is no separation of religion and state in Islam; Islamic law reflects God’s, not humans’, desire; and Muslims are treated as unitary, without regard to any social divisions. However, Huntington (1993) recognizes that the West attempts to impose its liberal-democratic values on other civilizations through its control of international governmental organizations, such as the United Nations.

Social scientists have challenged the general propositions of the clash of civilizations thesis, including the perception that Islam and democracy are incompatible. To begin, the thesis ignores variation within civilizations, as people may identify with their nation, race/ethnicity, or even their religious denomination or sect to a greater extent than they identify with their civilization. More
specifically, social scientists point out that there is nothing inherently antidemocratic about Islam. To the contrary, Mansoor Moaddel notes a correspondence between concepts in Islamic scripture and democratic political arrangements: “Such concepts as shura (consultative body), ijma (consensus), and masliha (unity) pointed to an affinity between Islam and democracy” (2002, p. 365). Still other social scientists have collected survey data from people in Muslim countries and found that their values are not as monolithic as the clash of civilizations thesis suggests, except on issues regarding secularism. People in Muslim countries also hold evaluations of democracy that are similar to those of their counterparts in Western countries. Yet, people in Muslim countries are more likely to favor religious political leaders and are less supportive of gender equality and homosexuality than people in Western countries (Inglehart and Norris 2003; Norris and Inglehart 2004), a finding seemingly supporting the clash of civilizations thesis.

While it is clear that there are institutional and value differences between countries, including between countries that form Islamic and Western civilizations, it is unclear if these differences are due to the nature of religious traditions. An alternative explanation that Huntington rejects is that these differences may instead be the consequence of countries’ different levels of “modernization” and economic development. Economic development is positively related to the institutionalization of democracy and a political culture emphasizing democratic values (Geddes 1999; Norris and Inglehart 2004). From this perspective, it thus makes sense that Western countries, which tend to be substantially more wealthy than countries in the Islamic or African civilizations, are more likely to be democratic.

In sum, social science research indicates that some of the patterns that the clash of civilizations thesis posits are real. Although contemporary events might seem to lend further credence to this thesis, there is limited systematic evidence on the extent to which civilizations clash with one another. Finally, social scientists are divided on whether these patterns and conflicts are due to religious traditions, economic development, or other factors.

CLARK, KENNETH B.

1914–2005

Kenneth Bancroft Clark and his wife, Mamie Phipps Clark (1917–1983), were arguably the most famous African American psychologist couple of the twentieth century. Their research was cited in the U.S. Supreme Court’s 1954 Brown v. Board of Education decision that declared segregated schools unconstitutional. During the 1940s and early 1950s, they conducted tests that were designed to identify racial identification and racial preference in young children. One of these experiments came to be known famously as the doll test. The Clarks concluded that racial segregation created psychological damage in African American and white children, although the Court neglected to address the latter issue. However, many scholars, teachers, and social welfare professionals since the 1960s have contended that this research was flawed, particularly the methodology used in the doll tests. They argued that the tests were too limited in their capacity to lead to the conclusion that African American children in particular were psychologically damaged. They maintained that the Clarks posed African Americans as damaged for political purposes in order to gain white support for racial integration.

Clark was born in Panama, the son of Jamaican migrant workers. When he was five, his mother moved to Harlem in New York City with him and his younger sister. He graduated from Howard University with B.A. and M.A. degrees in psychology in 1935 and 1936. His professors included political scientist Ralph Bunche (1904–1971) and Francis Cecil Sumner (1895–1954), the first African American to earn a PhD in psychology. In 1940 Clark became the first African American to receive a PhD in psychology from Columbia University; his wife became the second two years later (they had married in 1938). During graduate school, he worked on Gunnar Myrdal’s (1898–1987) famous study, An American Dilemma (1944). After teaching at Hampton University, Clark became in 1942 the first African American psychol-
ology professor at City College in New York. He remained there until his retirement in 1975.

Clark is best known for his involvement in the Brown case; much of his research was included in his first book, *Prejudice and Your Child* (1955). To his supporters, his career exemplified a steadfast dedication to integration; his detractors on the other hand ridiculed his integrationist positions. Yet Clark was far more complicated intellectually. He viewed racism as part of a larger problem involving what he called the “dilemma of power.” Because humanity had never resolved “the issue of power versus ideals,” human beings could rationalize conflicts between abstract concepts of justice and equality on the one hand, while maintaining privilege and status on the other. In other words, he pushed further W. E. B. Du Bois’s (1868–1963) contention that the problem of the twentieth century was the color line. Clark also disagreed with Myrdal’s position that racism contradicted the American creed; instead, he argued that beliefs in equality and white supremacy were not contradictory but compatible.

This intellectual framework shaped Clark’s research and activism during the 1960s and 1970s, especially his second and third books, *Dark Ghetto, Dilemmas of Social Power* (1965) and *Pathos of Power* (1974). The former work used Harlem as a prism to present a bleak and pessimistic view of the impact of ghettoization on the daily lives of its citizens. Many readers interpreted his work as an endorsement of the “culture-of-poverty” thesis that was in vogue at the time among many scholars in fields such as anthropology, sociology, and education, but Clark presented a much more complex analysis of African American life in the ghetto than he has generally been credited for. He was highly critical of the cultural approach, charging that such analyses substituted for discredited biological theories to explain and justify racial differences. Instead, he argued, for instance, that “educational deprivation” was a more accurate term to describe what was actually happening in schools once they became predominately poor and black; because of their powerlessness, they no longer received the basic services—good teachers, competent administrators, decent buildings—that wealthier and whiter communities received. In that sense, *Dark Ghetto* was more of an indictment of American society, rather than solely a critique of African American community life.

In addition to his writings, Clark was influential in both activist and policymaking circles. In 1946 he and his wife founded the Northside Center for Child Development, the first interracial institution of its kind in New York City. His research led to his participation in the 1950 White House Conference on Children and Youth. Aware that the problems of education and poverty were linked, he designed the ambitious Harlem Youth Opportunities Unlimited (HARYOU) program in the early 1960s as a model for the “war on poverty.” He was named in 1966 to the board of regents of the New York State Department of Education and in 1968 to the board of the New York State Urban Development Corporation. In 1967 Clark founded the Metropolitan Applied Research Center (MARC), which led a concerted effort to reject the culture-of-poverty thesis through publications and applied programs. MARC also worked to close the educational achievement gap through such efforts as its program (known as the Clark Plan) to reform the Washington, D.C., school system. Finally, in 1971, Clark became the first African American elected president of the American Psychological Association.

Despite his accomplishments, Clark grew pessimistic about the state of racial progress. He thought that he had failed at his most important work—HARYOU, the Clark Plan, and his efforts on school desegregation—to empower the black poor and close the educational achievement gap. Ironically, the man who wrote so eloquently about the lack of power in African American life concluded that he too lacked power.

**CLASS**

Much has been written on class in the years since Seymour Martin Lipset wrote his entry in the first edition of this encyclopedia, published in 1968. Lipset viewed the literature on class in terms of “social stratification,” which he believed was divided into two approaches, the functionalist and the “social change” perspectives. Nevertheless, the bulk of his piece was centered not on contemporary studies, but on Karl Marx (1818–1883), Max Weber (1864–1920), and Émile Durkheim (1858–1917), who, Lipset argued, continued to animate the central debates of his time. The classics are no less important today, but this essay will aim to balance them with the now canonical
debates of the mid-twentieth century and the vast and multifaceted literature that has amassed since then.

MARX, WEBER, AND DURKHEIM

Any discussion of class must begin with Karl Marx. As Lipset once noted, while David Ricardo (1772–1823), Adam Smith (1723–1790), and others may have written about class before Marx, it was Marx who set the terms of debate for later sociological thinkers (Lipset 1968). For Marx, classes do not exist in societies where production for the group results in an equitable distribution of resources and requires that each member or unit contribute to the collective requirements of life. Classes emerge only when one subset of a community seizes private control of the means of production (e.g., land, factories) and coercively extracts surplus labor from another subset of the community, that is, labor that neither the first group needs nor the second group must give in order to survive.

Marx viewed the extraction of surplus labor as a fundamentally exploitative act, since the real exchange value of any given commodity is only ever equal to the labor time socially necessary to make it. This is called the labor theory of value. Any effort to squeeze out surplus value requires that human beings be forced to work for free beyond the labor time socially necessary both to maintain their labor power (e.g., through food and raiment) and to produce its equivalent in commodities. Thus, one’s class is determined by one’s relationship to the means of production: those who own the means of production and therefore forcibly extract surplus value comprise one class, while those who do not own the means of production and are therefore coerced to generate surplus value form another class. Like master and bondsman under slavery and lord and serf under feudalism, capitalism is predicated on two classes: the factory owners or bourgeoisie and the factory workers or proletariat. All of these, however, only form “objective” classes, meaning that they are classes determined merely by their proprietary relationship to the means of production. The subjective form of class, by contrast, is a class that is conscious of itself as a collectivity of similarly positioned individuals and is therefore capable of class action. The distinction between objective and subjective forms of class is infamously that of the class-in-itself (an sich) and the class-for-itself (für sich).

According to some interpretations of Marx’s work, particularly those of the Communist Manifesto (1848), the transition from a merely existing working class to a conscious and therefore revolutionary working class is inevitable, as is the classless communist society that workers will eventually found. Because of its revolutionary and progressive potential in every epoch of production, class is said to be the very motor of history (Marx and Engels [1848] 1998; Marx [1852] 1996; Marx [1867] 1906). Hence, the oft-quoted claim, “The history of all hitherto existing society is the history of class struggles” (Marx and Engels [1848] 1998, p. 34).

Max Weber did not doubt the existence of exploitative class relations in modern society. Rather, he questioned Marx’s definition of class, its centrality in modern life compared to other forms of domination, and the apparent inevitability of class action in Marx’s work. In Weber’s foundational piece on this subject, “Class, Status, Party” (1922), class is conceived of not as a group but as a sea of unconnected individuals who share the same “life chances,” of which ownership of the means of production is just one example. Life chances comprise the bargaining power that one brings to the market for the purpose of maximizing income and includes professional authority, skills, and education. Just because one shares a similar set of life chances with others, however, does not mean that one will join with similarly positioned individuals in class action. Shared life chances are a necessary condition of class action, but they are by no means a guarantee, for there are other forms of domination apart from the economic that have the capacity to contravene class action. Societies that are organized according to “status” are less susceptible to class action, because they are stratified according to noneconomic concerns such as family, ethnic, or religious heritage. Partisan allegiances may also be an impediment to class solidarity (Weber 1946).

Émile Durkheim’s foremost contribution to class analysis was to conceive of it in terms of occupational specialization in a modern and largely peaceful division of labor. Durkheim sought to explain the transition from the “mechanical solidarity” of primitive societies, whose coherence was based on the resemblance of actors and the dominance of a collective consciousness, to the “organic solidarity” characteristic of modern societies, whose coherence was based on the complementarity of highly specialized individuals. Organic solidarity breaks down only when individuals are coerced into tasks that they do not want to perform. Thus, the central challenge of modern societies is to match individuals with tasks that suit their natural talents. This is why organic solidarity may be achieved by contracts or exchange, which bind individuals through a system of rights and duties, and in turn give rise to rules that guarantee regular cooperation between the divided functions (Durkheim [1893] 1960).

STRATIFICATION

Kingsley Davis (1908–1997) and Wilbert Moore’s (1914–1987) now-foundational piece, “Some Principles of Stratification” (1945), marked the translation of Durkheimian sociology into contemporary debates on class. Davis and Moore took as their challenge the ques-
tion of how modern societies so successfully channeled their members into an elaborate and specialized division of labor. Infusing Durkheim with Weber’s emphasis on skills as life chances on the market, they reasoned that this monumental undertaking would require nothing less than a mechanism that could motivate the most qualified people to train for, seek, and perform the duties of the most important positions. Famously they hypothesized that an unequal system of occupational rewards was necessary to track the talented to their rightful place in the division of labor. Thus, professionals earn more than manual laborers, because the former positions must have greater built-in economic incentives to motivate the most highly talented to undertake the costly educational sacrifice necessary for those jobs. Social inequality, in other words, was not the result of the exploitation of one part of society by another and therefore a thing to be abhorred, but merely the system through which society unconsciously placed its most talented members into the most functionally important roles, without which society would be imperiled.

Among the more prominent early responses to Davis and Moore was that of Melvin Tumin (1919–1994), who argued that “functional importance” is an ideological construct. Power, he insisted, is a better measure of who gets ahead, such that the result of stratification, far from tracking the most talented people to the top, actually strangles talent at the bottom, making stratification deeply dysfunctional. Later Lipset and Reinhard Bendix (1916–1991) showed conclusively that the belief in upward mobility far exceeded the actual rate in the United States, while Peter Blau (1918–2002) and Otis Duncan (1921–2004) introduced path analysis to demonstrate the enduring effects of parental background and schooling on occupational attainment (Tumin 1953; Lipset and Bendix 1959; Blau and Duncan 1967).

But if Davis and Moore marked the introduction of Durkheim and Weber into the functionalist approach to class, then Ralf Dahrendorf (1957), the founder of modern conflict theory, did so for Marx and Weber. Dahrendorf sought to create an alternative to Talcott Parsons’s (1902–1979) functionalist social system that could better account for internal conflict. A “Left Weberian” who saw class as fundamentally exploitative, Dahrendorf argued that Marx’s focus on property as the ultimate marker of class was limited, especially in light of the control exercised by nonowner managers. Property and the coercive extraction of surplus value were for him subordinate forms of a more general social relation, authority, which served as the basis of binary “class conflict” in a variety of social settings including, but not limited to, industrial production. Dahrendorf, however, was criticized for expanding the meaning of class so far beyond the economic realm as to make the term meaningless (see, for example, Coser 1960).

Responding to Nicos Poulantzas (1936–1979), whose Political Power and Social Classes (1973) identified a “new petty bourgeoisie,” Erik Olin Wright (1978, 1997) argued that a new class of white-collar workers had emerged as a result of elaborate organizational hierarchies and the separation of ownership from directive control of large industrial corporations (Giddens and Held 1982). Workers and owners continued to occupy diametrically opposed class positions, but white-collar workers had come to occupy “contradictory class locations” in which the latter enjoyed some degree or combination of autonomy, skill, and authority on the job. Though critics have argued that Wright smuggled Weber into his Marxist framework by expanding the basis of class location beyond exploitation and production, Wright nevertheless found a dividing line between white-collar employees who identify more with labor and those who identify more with capital, thus articulating a bourgeois-proletarian divide for a new age.

TWO CHALLENGES

In the aftermath of the Soviets’ repression of democratic movements in Hungary (1956–1957) and Czechoslovakia (1968–1969), class analysis and in particular Marxism were assailed on several fronts both for what was seen as the perversion of Marx’s humanist vision by state-sponsored socialism and for the exclusion of non-class-based identities, inequalities, and movements from public discourse. With respect to the latter, Frank Parkin (1979), another Left Weberian like Dahrendorf, criticized structural Marxism’s assumption of internally homogeneous classes, as well as its inability to account for the enforcement of social boundaries between elites and workers. As an alternative, Parkin advanced the concept of “social closure,” the process by which social collectivities, whether by class, race, gender, or a combination of these, seek either to maximize rewards by restricting access to resources and opportunities (in the case of elites) or to usurp rewards previously denied to them (in the case of nonelites).

Alberto Melucci (1980) likewise criticized the social-movement literature for emphasizing the political realm of movement activity while neglecting its nonpolitical or “social” dimensions. This, he noted, made sense in the study of working-class movements, which often have an institutionalized political arm, but did not square with women’s movements, for instance, which, in addition to struggling for political rights, also seek to address social concerns of difference and recognition and do not vie for state power. More recently, Sonya Rose (1992) has argued that gender is not a secondary by-product of class relations as Friedrich Engels (1820–1895) and some Marxist feminists have suggested, but rather a central component thereof. Thus, in late nineteenth-century England, factory wages were adjusted by gender not only to the benefit of
capital, but also to the benefit of men, as it reinforced a discourse of female respectability tied to the subordination of women in the household and society at large.

E. P. Thompson’s (1924–1993) critique of structural Marxism in the Making of the English Working Class (1963) was a lightning rod for emerging controversies within Marxism itself. The main point of this critique is that workers do not constitute a class because they share a similar structural position, but because they forge themselves into a class through their own language, culture, and struggle. The working class on this account is always already a conspirator in its own creation, thereby negating the analytical necessity for the in-itself/for-itself dichotomy. This challenge to the structural Marxism of Poulantzas, Perry Anderson (1980), and Louis Althusser (1971), among others, was led initially by the British cultural studies school of Thompson, Raymond Williams (1977), and sociologist Stuart Hall (1983).

Subsequent research, not all Marxist, has celebrated the agency of class actors, as in James Scott’s account of subversive everyday behavior in Weapons of the Weak (1985); the indigenous culture of workers, such as Craig Calhoun’s “reactionary revolutionaries” and the processual, as opposed to the positional, dimensions of class formation exemplified by Anthony Giddens’s concept of “structuration” and Pierre Bourdieu’s (1930–2002) “habitus” (Bourdieu 1977; Przeworski 1978; Sewell 1980; Calhoun 1983; Bourdieu 1984; Giddens 1984; Katzenelson and Zolberg 1985; Fantasia 1988; Bourdieu 1990; Steinmetz 1992; Somers 1997).

For Bourdieu, as an example, class typically functions at the level of shared dispositions or *habitus* (e.g., tastes, bodily carriage, language), which, though stemming from certain shared material conditions, manifests itself more as a “feel for the game” than as a primarily economic relationship. One is, without the effort of reflection, a “virtuoso” in negotiating the social terrain of one’s class, very much as a professional soccer player, to use Bourdieu’s analogy, knows precisely when and with what force and curvature to kick the ball in a breakaway situation. These dispositions only emerge recognizably as “class” when crises drag the material and dispositional differences among groups from the field of the unspoken (referred to as *doxa*) to the field of public opinion. Habitus, it is important to note, is not a fixed set of dispositions, but rather given to improvisation and thus to transforming the terms of class belonging. The analytical result is that class, through habitus, is neither structure nor agency, but structuring or both simultaneously.

**THE FUTURE**

One possible implication of this constant reworking of class is that it is no longer a workable analytical concept. Paul Kingston’s The Classless Society (2000) is among the latest in a long line of studies that question the predictive power of class in shaping mobility, culture, voting, and consciousness, among other outcomes. On the other hand, there is a movement afoot to rebuild class analysis. David Grusky and Jesper Sørensen (1998), for example, contend that class models can be made more plausible if analysts radically disaggregate occupational categories to the unit occupational level. Moreover, the eclipse of the Soviet Union in 1991 and the attendant rise of neoliberalism have put the question of class back on the table if there had ever been any doubt. Noting the deepening class polarization since the late 1970s, David Harvey (2006) has argued that neoliberalism is a failed utopian rhetoric masking a far more successful project to restore economic power to the ruling classes. Future lines of inquiry include new forms of international class formation, the evolving relationship of party to class as the institutionalized Left goes into decline, and the disappearance of wage-based employment and thus of the very basis of social citizenship and welfare.

**CLASS, LEISURE**

In The Theory of the Leisure Class (1899), American economist Thorstein Veblen (1857–1929) distinguishes between two classes of individuals, the class that is focused on productive labor and the leisure class, a division that developed during the barbarian/feudal stage of society. These groups can be understood as similar to Karl Marx’s (1818–1883) notion of classes within capitalism, in which the proletariat and the capitalist (bourgeoisie) class are in conflict over the distribution of society's wealth, power, and the division of labor. However, Veblen incorporates culture into this division with an understanding of production and consumption, material life, status, and economic stratification. According to Veblen, modern economic behavior was based on the struggle for competitive economic standing, as the aristocratic consumption of luxuries served as a litmus test for elite status during the peak of capitalist industrialization. The leisure class itself consists of social elites, businesspeople, and captains of industry (those at the top of the social-class pyramid), who engage in pecuniary activities that detract from the productive aspect of society.
Members of the leisure class attempt to garner status and competitive social advantage through their patterns of consumption (of goods and symbols) and their conduct, thereby driving economic life around status rather than utility. Social status is symbolized by the leisure class through conspicuous waste, conspicuous consumption, and conspicuous leisure, which are used to communicate and enhance social position and social standing and to obtain heightened self-evaluation. Conspicuous waste is evidence that one can afford to be frivolous with items as well as time (no need to work); conspicuous consumption is the socially visible display of expensive goods that signify class status. Both of these activities indicate wealth and the ability to afford leisure, meaning the lack of a need to perform manual and useful labor.

Conspicuous leisure is the benchmark for determining elite status and serves as a symbolic statement that one is above laboring. In this way, it functions similarly to what Pierre Bourdieu (1930–2002) referred to as cultural capital in that it is a description of class compounded with status. Lower-status groups emulate the leisure class in an attempt to increase their own status. Veblen discusses how women are exploited by men through vicarious conspicuous consumption, waste, and leisure, where women perform the conspicuous activity of leisure, and men benefit in terms of status from these activities. For example, ideals of feminine beauty (frailty, weakness, paleness—indicating that the woman is not able to labor), certain restrictive fashions that incapacitate labor, and the removal of women from socially visible productive labor all contribute to the good name of the household and its master.

CLASS, RENTIER

Rentier is a class of people who derive their incomes from financial titles to property. Though the term makes an analogy with the old rent-earning class of great landowners, rentiers are characterized by their more distant relationship to the property they own. Rather than living in an estate in the midst of their property, they own a variety of anonymous income-earning assets, most typically shares and instruments of debt. From the rentiers, all vestiges of the paternalism, noblesse oblige, and personal dependence that once characterized the landowning aristocracy have vanished, leaving them as pure consumers of financial revenues.

While with industrialization a portion of the landowning class transformed itself into rentiers—particularly those, like the duke of Westminster, whose lands became urban—the existence of a rentier class can be seen as an inevitable consequence of the development of capitalist financial institutions. The term rentier came to prominence in the early twentieth century and remained influential in economic discourse during the 1920s and 1930s. In the early twenty-first century it is again attracting attention as the financial sector comes to be dominant in mature capitalist economies.

What causes the financial sector to replace manufacturing as the bedrock of the economy? Its supposed role is to fund investment. Savings are meant to be channeled through the banks, investment trusts, and the stock market into firms that want to carry out investment in new capital stock. This process obviously does occur, but in many capitalist countries the financial accounts show that industrial and commercial companies are net suppliers rather than users of funds. It is by no means obvious why, in the face of continuing improvements in information-processing technology, the sector that carries out this channeling of funds should over time absorb a larger and larger portion of national resources and appear to contribute an increasing share of national income.

Channeling funds is manipulation of information. The “funds” are records kept by the banking system, and their channeling is a sequence of transfers between records. The records long ago moved from paper to computer databases. The power of computers has improved by leaps and bounds. One would have thought that the labor required to manage this system would have declined. The mechanization of agriculture eliminated the peasantry, but computers have not laid waste to the City of London. Why?

The key to this paradox is to realize that, despite the modern jargon of a financial services “industry” that offers financial “products” to customers, the financial sector is not a productive industry in the normal sense. Its structural position in capitalistic information flows ensures its
continued command over resources despite changes in technology that would decimate any other industry.

Figure 1 shows in summary form the flows of funds into and out of the financial sector. Savings by individual capitalists, by firms, and from the pension schemes of employees enter the system. Funding flows out to firms carrying out capital investment and also typically to the state to fund the public debt. However, money also flows out as costs: the income of the financial sector itself. This comprises wages of its employees, the bonuses it pays, the distributed dividends of financial companies, and the costs of buildings and equipment that the sector uses. Let us denote savings by $\sigma$, bonuses and costs by $\beta$, and funding of investment by $\varphi$.

The residual, which we will denote by $\delta$, is made up by the change in the money balances of the financial sector itself: $\delta = \sigma - \beta - \varphi$. We need to explain why $\beta$, the costs/income of the financial sector, rises as a share of national income over time.

It has been argued that the real rate of return on capital tends to decline over the course of capitalist development (Marx [1894] 1971; Lebowitz 1976; Moseley 1990; Michaelson, Cockshott, and Cottrell 1995; Duménil 2002; Edvinsson 2003, 2005). If the rate of interest does not fall at a corresponding rate, then the level of voluntary fundraising by firms will decline, because a diminishing portion of firms will be making enough profits to cover the rate of interest. However, the level of savings will not necessarily decline at a corresponding rate.

The distribution of income in capitalist societies will be highly uneven (Levy and Solomon 1997, 1998; Reed 2001, 2003). A large proportion of income goes to a small part of the population. People with high incomes tend to save most of it. A decline in the rate of profit on capital will not alter this. It just means that the book value of the assets of those with high incomes rises. So savings going into the financial system will not decline. The disproportion between share issues and savings tends to make share prices rise; this in turn will induce a rise in the costs of the financial sector $\beta$ through bonuses and so on.

A feedback mechanism is at play here. The average price of shares rises until the extra bonuses earned by the financial sector absorbs any excess of savings over investment. The argument above takes certain things as given—in particular, the separation of the capitalist class into a set of rentiers and a set of firms engaged in direct production. While this is a realistic portrayal of mature capitalism, it is not capitalism’s aboriginal condition. In an earlier phase of capitalism, the rich did not save through financial intermediaries; they saved by investing in their own businesses. One has to ask what mechanism caused an initial population of capitalist masters to polarize into these two subgroups: functioning businesspeople and rentiers who invest only indirectly.

The transition process can be understood as a consequence of the dispersion of profit rates in an initial population of capitalists. Capitalists whose profit rates are above average find it beneficial to borrow funds to invest in their own business; those whose profit rates are below the interest rate gain more by depositing their profits with financial institutions than they would by reinvesting. Borrowing raises what is called the gearing ratio of borrowing firms and lowers that of lenders. Industrial capitalists initially earning a low rate of return in industry come, by lending, to acquire negative gearing ratios. In the process they transform themselves from entrepreneurs into rentiers.

The designation rentier was initially applied to individual people, but it applies equally well to any legal entity in the same situation. Limited companies, with respect to their fellow companies, have begun to function as rentiers: that is, they derive their income primarily from their financial rather than their industrial assets. As the demand for funds in the industrial and commercial sector dries up in the face of high interest rates, lending comes to be directed increasingly toward the funding of state debt and consumer credit. With a growing portion of capital depending on interest rather than industrial profit, there develops an increased political pressure to maintain high interest rates. This baneful effect of the rentier interest, which was already lambasted by J. A. Hobson (1902) and John Maynard Keynes (1925, 1936) for its role in consuming capital and hindering investment, looks set to grow. Early twentieth-century critics of the rentier class like Hobson, Keynes, Thorstein Veblen, and even V. I. Lenin identified another trait—its predatory character. To this trait they attributed the disaster of World War I and the deferred disaster of the Versailles treaty.
The rentier interest stood ultimately on moral grounds quite alien to those of natural right. Speaking of the absentee ownership of natural resources, Veblen remarked, “The owners own them not by virtue of having produced or earned them. … These owners own them because they own them, … title is traceable to an act of seizure, legalized by statute or confirmed by long undisturbed possession” (1923, p. 51). This trait is best exemplified today by Russian rentiers like Roman Abramovich, whose billions derive from the greatest undisguised seizure of natural resources within living memory.

CLASS, SOCIAL

SEE Class.

CLASS CONFLICT

Class conflicts are a crucial determinant of historical change, for “history … is the history of class struggles” (Marx and Engels [1848] 1998, p. 2); they are endemic because class interests are contradictory, and irresolvable as long as the mode of production remains unchanged. Class conflicts are inherent in the relationship between owners of means of production, who appropriate most of the surplus value created through production, and the direct producers whose share allows them, at best, only to reproduce themselves as workers. Non-Marxist theories of class, based on functionalist or Weberian perspectives, tend to underemphasize the collective dimension of class and its foundation in the objective relationship of people to the means of production. They define class, instead, as an attribute of individuals constructed on the basis of their education, occupation, income, ownership of resources, place in the occupational hierarchy, and so on. Consequently, they conflate class with socioeconomic status, thus obscuring the qualitative differences between class structure and social stratification.

In precapitalist social formations, class struggles assumed different forms, depending on the level of development of the productive forces, and the forms of appropriation of the surplus. Land was the main means of production and complex patterns of land ownership were reflected in complex networks of class relations and struggles between masters and slaves, “patricians and plebeians, lords and serfs, guild-master and journeyman” (Marx and Engels [1848] 1998, p. 2), landowners and tenant farmers, and so forth. The Roman and Greek economies, for example, were “slave economies,” despite the presence of free, independent peasants and small producers, because “the main way in which the dominant propertied classes of the ancient world derived their surplus … was due to unfree labor” (de Ste. Croix 1981, p. 52). And the process of “primitive accumulation” through which money and commodities became capital, and serfs, independent peasants, and small producers became wage-workers, entailed the expropriation of direct producers from the land through unrelenting class struggles; its history “is written

In capitalist social formations today, where labor is formally free, the struggle centers around wage levels and the length of the working day, for capitalists seek to keep wages low, working hours long, and profits high. In the market, where workers and capitalists meet as equal commodity owners, capitalists purchase the only commodity workers can sell: labor power. The use value of labor power is the production of value far greater than its own (i.e., the value of the wages capitalists pay); this value is embodied in the product. In the context of production, there is no equality: Capitalists control working conditions, the labor process, the length of the working day, and they own the product (Marx [1867] 1967, chs. VI and VII). Workers’ demands for the eight-hour day led to violent class struggles in the nineteenth and early twentieth centuries (Foner 1986). Conflicts about the length of the working day persist today; some employers impose overtime rather than hire more workers and low wages force many workers to hold more than one job or work more than eight hours a day.

The revolutionary worldwide confrontation between capital and labor predicted in the Communist Manifesto (Marx and Engels [1848] 1998) has yet to happen, however, and localized attempts in Eastern Europe, China, and Latin America have failed. Workers today do not have class consciousness in the classic sense; they do not share a sense of themselves as a class with common anticapitalist grievances and, consequently, they are not a “class for itself” united and with clarity of purpose (Marx [1846] 1947). They are only concerned with economic survival, not with the overthrow of capitalism: They are merely a “class in itself,” objectively identifiable by social scientists, but lacking self-awareness. Workers’ spontaneous consciousness is largely individualistic and “economic,” a phenomenon that Marxist theorists have addressed in different ways.

V. I. Lenin argued that “the working class, exclusively by its own effort, is able to develop only trade union consciousness” ([1902] 1967, p. 122), hence his support for the role of a “vanguard party” and the bourgeois intelligentsia in politically educating the working class. Adhering to the principle of historical materialism, that social existence determines consciousness (Marx and Engels [1846] 1947, pp. 13–14), Georg Lukacs emphasized the role of praxis or human activity in the formation of class consciousness. It is through working-class praxis that society can become conscious of itself, for the proletariat is both the subject and object of history (Lukacs 1971, pp. 18–19). Only from the class standpoint of the proletariat is it possible to comprehend social reality as a totality, a crucial prerequisite to acting as a self-conscious class (p. 20). It is unclear, however, how this comprehension will emerge, because the forces of history unfold independently of individuals’ intentions and consciousness. Consciousness, Lukacs states, is “subjectively justified” in its historical context, though it “objectively … appears as ‘false consciousness’ … [because] it by-passes the essence of the evolution of society … [and] fails to express it adequately” (pp. 47–50; italics in original). Whatever the intended motives and goals of this “false consciousness” may be, however, they further “the objective aims of society” (p. 50; italics in original).

Class consciousness, consequently, is something different from the ordinary thoughts individuals develop through praxis; it is neither “the sum nor the average of what is thought or felt by the single individuals who make up the class” (p. 51). Rather, it is “the appropriate and rational reactions ‘imputed’ … to a particular typical position in the process of production” (p. 51). Using Weber’s methodology (Kalberg 2005, pp. 14–22), Lukacs constructs an ideal type of class consciousness, by relating it to society as a whole and then inferring the thoughts and feelings that individuals in different class positions would have if they had access to knowledge of the totality (i.e., the mode of production) and of their place in it (p. 51). Impeding the development of “true” proletarian class consciousness are commodity fetishism and other reifications characteristic of capitalist culture. Lukacs’s arguments imply, however, that as capitalism develops, workers will eventually discern their place and objectives in the totality and will therefore consciously further the “aims of history.”

Whether social reality will eventually become “transparent” or ideology will always cloud class consciousness and, more generally, people’s spontaneous understanding of their conditions of existence, remains an unresolved issue. Louis Althusser’s view is that ideology as such, unlike specific ideologies, “has no history”; it is, like Freud’s unconscious, omnipresent and eternal (Althusser 2001, p. 109). To say that ideology is eternal is to point out that individuals, spontaneously, cannot penetrate the logic of history and thus acquire knowledge of the unintended consequences of their actions. The opacity of social reality is a transhistorical aspect of the human condition, unlikely to change even after capitalism has been superseded by a society in which the direct producers are in control of the mode of production. And to say that ideology has no history is to recognize that all forms of consciousness and all systematic products of intellectual labor (morality, religion, philosophy, and politics) are the outcome of human material practices under historically specific conditions of existence (Marx and Engels [1846] 1947, pp 14–15).

The capitalist state rules through repressive (e.g., army, police, prisons) and ideological (e.g., family,
As these changes accelerate, class conflicts might become more widespread, but this does not necessarily mean that class consciousness will eventually replace other forms of workers’ consciousness, such as, for example, identity politics, racism, or xenophobia. In any case, class conflicts will continue for as long as capitalism remains the dominant mode of production. Such conflicts have been and will continue to be fought under a variety of ideological banners because people, as “ensembles of social relations” (Marx 1947, p. 198), live their lives at the crossroads of multiple experiences. Marx pointed the way toward an understanding of the relationship between social change, conflicts, and consciousness. In the process of studying change, “it is always necessary to distinguish between the material transformation of the economic conditions of production, which can be determined with the precision of natural science, and the legal, political, religious, artistic or philosophic—in short, ideological forms in which men become conscious of this conflict and fight it out” ([1859] 1970, p. 21). From Marx’s standpoint, class consciousness should not be understood in purely economic terms, but in all its complexity. It emerges from changes in people’s experiences and participation in class conflicts, which together pose challenges to the ideologies that have shaped their representations of those conflicts and experiences. Common experiences, the basis for the emergence of class consciousness, are “determined” by the productive relations into which men are born—or enter involuntarily. Class consciousness is the way in which these experiences are handled in cultural terms (Thompson 1966, pp. 9–10). These insights from Marx and E. P. Thompson indicate that it is necessary to examine the underlying class basis of contemporary processes of political mobilization and of struggles such as those happening in Bolivia, Mexico, and Venezuela. Underlying populist and indigenous movements for social justice and national independence from imperialist and corporate domination are material class interests, which fuel the rise of political leaders like Evo Morales (Bolivia), Lopez Obrador (Mexico), and Hugo Chavez (Venezuela), as well as the national and transnational opposition to them.

While class conflicts are inherent in class societies, this does not mean that if classless societies become possible in the future, conflicts will end. Class conflicts are grounded in struggles around the production and appropriation of the surplus. Under capitalism, they presuppose the existence of the capitalist and working classes. Were these classes to be abolished and some form of collective ownership of the means of production to replace capitalism, social conflicts would not end, however; the division of labor would continue to divide the population according to occupation, skills, and economic rewards. Struggles over redistribution of income would replace class conflicts focused on the abolition of the mode of production.
because racial, ethnic, gender, and other differences irreducible to class would continue to exist, struggles about recognition (Fraser 1995) would continue as well. Conflicts based on social stratification would continue for as long as the subjective and material conditions inherited from capitalism persisted and competed with new forms of consciousness, practices, institutions, and so forth. The interconnections between experience and consciousness suggests, however, that as class conflict disappeared, the material conditions for social antagonisms at the level of social stratification would likely be eroded as well. In any case, as long as capitalism is the dominant mode of production, class conflict will continue to shape national and transnational political struggles.

CLASS CONSCIOUSNESS

The concept of class consciousness emerged in nineteenth-century socialist theories of social emancipation, mainly in the work of Karl Marx (1818–1883). Marx’s critique of the idealist philosophy of Georg W. F. Hegel (1770–1831) led him to state, in his German Ideology (1845), that human consciousness is determined by material experiences and conditions, and not the reverse. As Marx argued in the Eighteenth Brumaire of Louis Bonaparte (1852), class consciousness entails both the common interests of a social class as arising from its material situation (“class in itself”) and the solidarity articulated from such interests in the struggle against another class (“class for itself”).

The protagonist of Marx’s idea of class consciousness is mainly the proletariat in the capitalist mode of production. Working-class consciousness is in this view the highest and truest form of consciousness ever expressed by a subaltern social group. In fact, for the first time in history, the consciousness of the oppressed can directly confront the economic mechanisms of exploitation. It does not, therefore, have to deal with the religious ideas, customs, and traditions that, in the words of the Communist Manifesto (1848), had “veiled” social relations in earlier epochs.

Marx’s analysis of class consciousness remained, however, unfinished as part of his general discussion on classes in the third volume of Capital (1894), a project that was interrupted when Marx died. Twentieth-century Marxists developed the concept in debates that to a large extent revolved around the relations between class consciousness and the organization of workers. Georg Lukács’s (1885–1971) History and Class Consciousness (1971) saw “true” class consciousness as the proletariat’s awareness of its revolutionary goal and, at the same time, as the most adequate set of reactions that could be “imputed” to particular positions in the production process. The revolutionary party is for Lukács the personification of the collective consciousness of the working class. Vladimir I. Lenin (1870–1924) and Karl Kautsky (1854–1938) emphasized the role of organization by arguing that real class consciousness can only be brought to the working class from outside, a task that for Lenin required a party of professional revolutionaries. Below this level, Lenin saw a realm of merely “economist” consciousness, symbolized by trade unions’ struggles for their immediate demands.

The views of Lenin, Kautsky, and Lukács have been widely debated and criticized by various Marxist activists and scholars. In contrast to Lenin’s theory of the party, Rosa Luxemburg (1870–1919) argued that class consciousness arises spontaneously from workers’ experiences of struggle, especially mass strikes. Karl Korsch’s (1886–1961) Marxism and Philosophy (1923) asserted that class
Classical Conditioning

consciousness is not the mere subjective reflection of economic conditions because ideology and politics can also independently shape social power relations. The autonomous role of ideology was further discussed in the structuralist tradition, especially in the work of Louis Althusser (1918–1990). It was, however, Antonio Gramsci (1891–1937) who placed this aspect at the center of his analysis. He argued that class struggle involves a contestation over “hegemony,” whereby the working class needs “organic intellectuals,” of which the party is an expression, who must be able to engage and shape the “common sense” of society.

Marxist analyses have since departed from earlier views of class consciousness as merely determined by economic conditions and ultimately represented by formal organizations. Social historians Edward P. Thompson and Eric J. Hobsbawm underline the complexity of workers’ consciousness, and the fact that their everyday experiences do not necessarily progress toward revolutionary ideas, being indeed often influenced by precapitalist notions of justice or collective identities. The view of human subjectivity in the work of members of the Frankfurt school, especially Herbert Marcuse (1898–1979), is influenced by psychoanalysis, and argues that consumerism has largely subdued the radicalism of a working class that is increasingly co-opted by capitalism. In Jean-Paul Sartre’s (1905–1980) “political economy of everyday life,” and in Wilhelm Reich’s (1897–1957) theory of psychic oppression, class consciousness is replaced by a theory of “serialized” and alienated human nature.

Such analyses tend to agree that as capitalism is able to extend middle-class consumption patterns, workers in industrialized countries lose their revolutionary potential. Conversely, class consciousness is replaced by a multiplicity of oppositional identities in the work of feminist scholars and in currents influenced by postmodernism, such as “autonomist Marxism.” Workers’ centrality in anticapitalist politics gives way to the development of social movements that express the specific demands of women, the unemployed, students, and indigenous people. At the same time, critics of the Leninist idea of the party stress the importance of horizontality and consensus as conditions for a shared awareness to emerge among diverse social actors. Moreover, production is no longer seen as being indeed often influenced by precapitalist notions of justice or collective identities. The view of human subjectivity in the work of members of the Frankfurt school, especially Herbert Marcuse (1898–1979), is influenced by psychoanalysis, and argues that consumerism has largely subdued the radicalism of a working class that is increasingly co-opted by capitalism. In Jean-Paul Sartre’s (1905–1980) “political economy of everyday life,” and in Wilhelm Reich’s (1897–1957) theory of psychic oppression, class consciousness is replaced by a theory of “serialized” and alienated human nature.

CLASSICAL CONDITIONING

The formation of connections or associations between related sensations, emotions, or thoughts is the basis for an evolutionarily old and important form of learning known as classical conditioning. Since the late nineteenth century, a collection of standardized conditioning (training) procedures have been used to study associative learning and, more recently, its neurobiological underpinnings.

IVAN PAVLOV

The Russian physiologist Ivan Pavlov (1849–1936) is customarily credited with discovering classical conditioning. In fact, the idea that associations develop between stimuli that are close together (contiguous) in space or time was first articulated by the Greek philosopher Aristotle (384–322 BCE). Pavlov did discover (i.e., identify and develop) an empirical approach for studying classical conditioning, codifying the procedures and terminology that remain the standard (Pavlov 1927).

Pavlov’s interest in classical conditioning emerged out of his research on the physiology of digestion, for which he was awarded the Nobel Prize in medicine in 1904. Pavlov and his technicians realized that a dog’s stomach secretions could be triggered not only by food reaching the stomach, but also by seeing or chewing the food, and even by the environment in which the food is delivered. The secretion of saliva was also found to be associative, with dogs salivating to stimuli that regularly preceded the presentation of food, including novel stimuli, such as a bell, that had never before induced salivation.

CLASSICAL CONDITIONING

With classical or Pavlovian conditioning, the neutral conditioned stimulus (CS) is paired with a biologically signifi-
cant unconditioned stimulus (US), until such time that the CS comes to elicit a learned or conditioned response (CR). Returning to Pavlov's dogs, after experiencing repeated pairings of the bell (CS) and food (US), the previously neutral bell began to elicit salivation. In this example, both the CR and the unconditioned response (UR) happen to be a salivatory response. This need not always be the case—the CR can also oppose or be entirely unrelated to the UR.

Two aspects of the CS-US temporal relationship impact the strength of Pavlovian conditioning: (1) the amount of time that elapses between the onset of the first and second stimulus (i.e., the interstimulus interval, or ISI); and (2) the order in which the CS and US are presented. In short- and long-delay conditioning, the CS precedes the US with a shorter or longer ISI, respectively. The addition of a break between the offset of the CS and the onset of the US results in trace conditioning. Simultaneous conditioning, as its name implies, requires that the CS and US be presented at the same time. Finally, with backward conditioning, the CS is presented after the onset of the US. As a general rule, the rate of learning in classical conditioning accelerates as the CS grows progressively more accurate in predicting the US. Delay conditioning is normally acquired fastest, followed by trace conditioning. Simultaneous and backward conditioning typically produce little or no learning.

APPETITIVE/aversive CONDITIONING

Appetitive conditioning utilizes a positive reinforcing stimulus—for example, access to food, water, or sex. Interestingly, animals conditioned with an appetitive stimulus, such as food, will often approach and contact the stimulus signaling its availability. If a localized visual stimulus (CS) repeatedly signals the delivery of food (US), pigeons will often peck at the CS before approaching the food cup, although pecking is not required for food access. Interestingly, the tracking of a food signal appears to be modality-specific. When trained with an auditory CS, which is presumably less localized in space, pigeons do not peck at the CS but instead advance toward the food cup directly (Brown and Jenkins 1968).

Aversive conditioning is accomplished with a mildly painful or otherwise unpleasant US. The two-process model of aversive conditioning posits that emotional (i.e., fear) CRs emerge first, followed by more specialized and adaptive motor CRs (Konorski 1967). Fear and motor conditioning are normally studied independently of one another—each utilizing distinct experimental procedures.

In a typical fear-conditioning experiment, the tone or light CS is paired with a mild electrical shock or loud noise US. Fear conditioning, which engenders a variety of autonomic and behavioral responses, is a very rapid form of learning—requiring only a single CS-US pairing under the right conditions (LeDoux 2000).

The most commonly studied motor CR is the anticipatory eyeblink. After being paired with an air puff or a mild shock to the eye (US), the tone or light CS comes to elicit a blink CR. Hundreds of trials are often required to properly time the response, but subjects eventually learn to execute the CR just before US onset (Christian and Thompson 2003).

The amygdala, in the brain’s medial temporal lobe, is critical for acquiring conditioned fear. The anticipatory eyeblink, on the other hand, is reliant on circuitry in the brain stem and cerebellum. In both cases, the repeated pairing of the CS and US allows the neural signals initiated by each stimulus to converge and interact. CS-US associative synaptic plasticity in the amygdala and cerebellum enables changes in CS neural activation patterns, bringing emotional and motor-conditioned responses, respectively, under control of the CS.

EXTINCTION

To this point, classical conditioning has been discussed in terms of nascent or established associations among stimuli. In the real world, such relationships rarely remain static—the CS may over time lose its ability to accurately predict the US. In a procedure called extinction, the CS is presented alone, once conditioning is complete, in order to weaken or extinguish the CS-US association and, by extension, the behavioral CR. The reduction in conditioned responding is not due to simple forgetting, however, which may occur following a prolonged absence of the CS. Extinction requires new learning on the part of the organism—learning that the CS is no longer predictive of the US.

Results from several behavioral phenomena make clear that extinction is not the result of unlearning the CS-US association. First, relearning the CS-US association is significantly faster following extinction than during the original acquisition. Second, an extinguished CR can temporarily reappear if an arousing or sensitizing stimulus is presented just before the CS. Third, over time an extinguished CR can spontaneously recover if the CS is represented. All three findings support the idea that the original CS-US association remains intact—though inhibited—once extinguished.

THERAPEUTIC/CLINICAL APPROACHES

Classical conditioning principles underlie many therapeutic techniques. Exposure therapy, for instance, is designed to aid patients who respond to particular objects or situa-
sions with unrealistic or excessive fear. For instance, Counterconditioning requires that the triggering stimulus be paired with a positive event or object. A patient might be shown a spider and then given a teddy bear—associating the spider with the comfort afforded by the bear. With desensitization, a patient’s irrational fears are rendered incompatible by slowly introducing progressively stronger versions of the triggering stimulus—for example, a picture of a spider, a plastic spider, and then a real spider.

Classical conditioning can also be applied to clinical studies that focus on human behavioral and cognitive processing. The brain regions engaged by classical eyeblink conditioning—including the brain stem, cerebellum, and limbic system—are the same brain regions affected by numerous clinical disorders. Discerning differences in the acquisition and timing of eyeblink CRs for patients, relative to control subjects, is an effective diagnostic tool for studying the brain-behavior correlates of clinical pathology. Autistic subjects, for instance, acquire eyeblink CRs at a faster rate and with an earlier onset time than age-matched controls (see Steinmetz et al. [2001] for a review).

PSYCHOLOGICAL PHENOMENA

Classical conditioning plays a role in many psychological phenomena. Emotions, as already noted, condition rapidly and easily, especially when the emotion is intensely felt. A traumatic experience can elicit strong emotions that become associated with other aspects of the situation, including the location, other people involved, and even the time of day. Attitudes and preferences are equally susceptible to modification by association. Attitudes toward people of other races, nationalities, or religions can be influenced by how they are portrayed in the news or entertainment media. Similarly, advertisers have long recognized the benefits of linking a consumer product, be it beer, jeans, or a car—with a positive reinforcer, such as an attractive model.

DRUG ADDICTION

Drug use is typically associated with a specific environment and a specific administration ritual (e.g., injection). These cues can be conditioned to predict the onset of the drug’s effect and, in turn, generate compensatory responses to counteract those effects—helping the body maintain homeostasis. A drug that decreases a user’s heartbeat would eventually, if taken in the same place and way, be offset by a compensatory heart rate increase. The activation of compensatory CRs also coincides and contributes to drug tolerance, necessitating more drug be taken for the same effect. Inasmuch, the chance of an overdose increases—due to a limited compensatory CR—if the drug is taken in a new environment or administered in a novel fashion (Siegel 1999).

OPERANT/INSTRUMENTAL CONDITIONING

Another form of associative learning, termed operant or instrumental conditioning, depends on association formation between the stimulus and response (S-R learning), unlike classical conditioning, which relies on S-S learning. Edward Thorndike (1874–1949) pioneered much of the early research on operant conditioning. He famously observed that a cat placed inside a latched cage would, through trial and error, learn how to unlatch the cage if rewarded with a piece of fish on the outside. From these observations and others, Thorndike formulated the law of effect, which states: the S-R association is strengthened or weakened depending on whether the consequent effect (US) is reinforcing or punishing.

By the mid-twentieth century, the premiere researcher on operant conditioning was B. F. Skinner (1904–1990). Skinner found that an animal’s behavior could be shaped by progressively narrowing the range of reinforced behaviors, a process called successive approximation. He also developed free-operant procedures for studying S-R learning. The typical Skinner box contained one or more stimulus lights, one or more levers that an animal could press, and one or more places in which reinforcers, like food, could be delivered. With hundreds to thousands of potential lever-press responses per session, Skinner focused his analyses on how rapidly the animal repeated the response.

CLASSICAL MUSIC

European classical music is both a topic of research and a source of ideas for social science. It can be studied as a set of specialized professions, an economic system, or an example of small-group interaction processes. As a source of ideas it helps social scientists reconsider classical social-scientific theories of culture types and the rise and fall of civilizations that have fallen out of favor but have much to contribute.

As Europe developed, technologically and socially, to become the dominant civilization in the world, its music also developed, embodying many of the same cultural tendencies that led to the spectacular success of this small region. One can chart the developments in complex vocal and orchestral music from roughly 1600, when a late–Italian Renaissance attempt to revive ancient Greek music drama led to the creation of grand opera, or starting as early as 1200, when music began to express European nationalism. An example is the 1228 “Palestina Song” by Walther von der Vogelweide, celebrating the Sixth Crusade’s capture of Jerusalem.

For centuries, among the most complex machines were European musical instruments: church organs, harpsichords, and pianos. Among the most complex civilian activities on earth were performances of major European musical works, such as Claudio Monteverdi’s 1607 opera L’Orfeo, Johann Sebastian Bach’s Mass in B-minor completed in 1749, and Ludwig van Beethoven’s 1824 Ninth Symphony. Coordination of such complex social activities required a system of musical notation far more advanced than possessed by any other civilization, division of labor among many highly skilled professionals, development of musical theory tied to mathematics and aesthetics, and strict discipline within a social system that rewarded individual achievements by composers, conductors, and soloists.

From the Crusades until World War I, European music evolved in a rather linear direction, for example, first gradually rationalizing musical scales until the time of Bach, and then progressively exploiting the chromatic possibilities of the well-tempered scale, notably in Richard Wagner’s 1859 Tristan and Isolde. These were made possible by technological developments, such as from increasingly complex harpsichords to the powerful eighty-eight-key modern piano and the addition of valves to brass instruments. Serious music had reached the limits of progress in this direction in Arnold Schoenberg’s ponderous oratorio Gurre-Lieder, first performed in 1913, the same year that Igor Stravinsky’s dynamic Rite of Spring sought to revive the European spirit through an influx of primitivism. To a very real extent, war brought an end to the European dream in 1914. Schoenberg’s response was to develop a system of atonal composition that was either a rejection of the European sense of melody or the fulfillment of the European evolution toward chromaticism in harmony. His mathematical twelve-tone method based a piece on a tone row, a series of the twelve tones of the octave, not repeating one until the other eleven had been played. He attempted to compose an entire religious opera, Moses und Aron, based on a single tone row representing God’s law. Schoenberg was unable to finish this work, and although many composers adopted his system, Stravinsky among them, it marked the effective end of European classical music rather than a new beginning.

European classical music illustrates the theory of Oswald Spengler, who argued that each great civilization begins with a unified set of ideas, builds on them, and attains their logical conclusion, at which point the civilization collapses. Pitirim Sorokin described this cycle of birth and death as a gradual shift from the original set of ideas that flourish in the civilization’s ideational or growth phase, to the gradual loss of faith that comes in the sensate or decline phase, which could be followed by another ideational phase.

Crosscutting these cyclical theories was Friedrich Nietzsche’s explicitly music-based theory of competition between Apollonian and Dionysian styles—roughly intellectual versus intuitive, or what Curt Sachs called ethos and pathos—as in the difference between Bach and Wagner. Following an information-theory approach, Leonard Meyer has argued that listeners develop expectations about what is to come next in music, both in a single work and within a broad tradition, and creativity violates these expectations. Thus, novelty gradually expanded the scope of European music, often by alternating between Apollonian and Dionysian extremes, leading in the twentieth century either to collapse or to a fluctuating stasis. The fact that every feature of European music differs from other traditions, such as the Arabic or Chinese, dovetails with Samuel Huntington’s theory that the world is not converging on one “modern” culture but faces a clash of civilizations.

CLASSICAL STATISTICAL ANALYSIS

Classical statistical analysis seeks to describe the distribution of a measurable property (descriptive statistics) and to determine the reliability of a sample drawn from a population (inferential statistics). Classical statistical analysis is based on repeatedly measuring properties of objects and aims at predicting the frequency with which certain results will occur when the measuring operation is repeated at random or stochastically.

Properties can be measured repeatedly of the same object or only once per object. However, in the latter case, one must measure a number of sufficiently similar objects. Typical examples are measuring the outcome of tossing a coin or rolling a die repeatedly and count the occurrences of the possible outcomes as well as measuring the chemical composition of the next hundred or thousand pills produced in the production line of a pharmaceutical plant. In the former case the same object (one and the same die cast) is “measured” several times (with respect to the question which number it shows); in the latter case many distinguishable, but similar objects are measured with respect to their composition which in the case of pills is expected to be more or less identical, such that the repetition is not with the same object, but with the next available similar object.

One of the central concepts of classical statistical analysis is to determine the empirical frequency distribution that yields the absolute or relative frequency of the occurrence of each of the possible results of the repeated measurement of a property of an object or a class of objects when only a finite number of different outcomes is possible (discrete case). If one thinks of an infinitely repeated and arbitrarily precise measurement where every outcome is (or can be) different (as would be the case if the range of the property is the set of real numbers), then the relative frequency of a single outcome would not be very instructive; instead one uses the distribution function in this (continuous) case which, for every numerical value of the measured property, yields the absolute or relative frequency of the occurrence of all values smaller than x. This function is usually noted as F(x), and its derivative f(x) = F'(x) is called frequency density function.

If one wants to describe an empirical distribution, the complete function table is seldom instructive. This is why the empirical frequency or distribution functions are often represented by a few parameters that describe the essential features of the distribution. The so-called moments of the distribution represent the distribution completely, and the lower-order moments represent the distribution at least in a satisfactory manner. Moments are defined as follows:

\[ m_k = \frac{1}{n} \sum_{i=1}^{n} (x_i - \bar{x})^k, \]

where k is the order of the moment, n is the number of repetitions or objects measured, and \( \bar{x} \) is a constant that is usually either 0 (moment about the origin) or the arithmetic mean (moment about the mean), the first-order mean about the origin being the arithmetic mean.

In the frequentist interpretation of probability, frequency can be seen as the realization of the concept of probability: It is quite intuitive to believe that if the probability of a certain outcome is some number between 0 and 1, then the expected relative frequency of this outcome would be the same number, at least in the long run. From this, one of the concepts of probability is derived, yielding probability distribution and density functions as models for their empirical correlates. These functions are usually also noted as \( f(x) \) and \( F(x) \), respectively, and their moments are also defined much like in the above formula, but with a difference that takes into account that there is no finite number n of measurement repetitions:

\[ m_k = \sum_{x} (x - \bar{x})^k f(x), \]
\[ m_k = \int_{-\infty}^{\infty} (x - \bar{x})^k f(x) \, dx, \]

where the first equation can be applied to discrete numerical variables (e.g., the results of counting), while the second equation can be applied to continuous variables.
Again, the first-order moment about 0 is the mean, and the other moments are usually calculated about this mean. In many important cases one would be satisfied to know the mean (as an indicator for the central tendency of the distribution) and the second-order moment about the mean, namely the variance (as the most prominent indicator for the variation). For the important case of the normal or Gaussian distribution, these two parameters are sufficient to describe the distribution completely.

If one models an empirical distribution with a theoretical distribution (any non-negative function for which the zero-order moment evaluates to 1, as this is the probability for the variable to have any arbitrary value within its domain), one can estimate its parameters from the moments of the empirical distributions calculated from the finite number of repeated measurements taken in a sample, especially in the case where the normal distribution is a satisfactory model of the empirical distribution, as in this case mean and variance allow the calculation of all interesting values of the probability density function $f(x)$ and of the distribution function $F(x)$.

Empirical and theoretical distributions need not be restricted to the case of a single property or variable, they are also defined for the multivariate case. Given that empirical moments can always be calculated from the measurements taken in a sample, these moments are also results of a random process, just like the original measurements. In this respect, the mean, variance, correlation coefficient or any other statistical parameter calculated from the finite number of objects in a sample is also the outcome of a random experiment (measurement taken from a randomly selected set of objects instead of exactly one object). And for these derived measurements theoretical distributions are also available, and these models of the empirical moments allow the estimation with which probability one could expect the respective parameter to fall into a specified interval in the next sample to be taken.

If, for instance, one has a sample of 1,000 interviewees of whom 520 answered they were going to vote for party A in the upcoming election, and 480 announced they were going to vote for party B, then the parameter $\pi_A$—the proportion of A-voters in the overall population—could be estimated to be 0.52, but this estimate would be a stochastic variable, which approximately obeys a normal distribution with mean 0.52 and variance $0.0002496$ (or standard deviation $0.0158$), and from this result one can conclude that another sample of another 1,000 interviewees from the same overall population would lead to another estimate whose value would lie within the interval $[0.489, 0.551]$ (between $0.52 \pm 1.96 \times 0.0158$) with a probability of 95 percent (the so-called 95 percent confidence interval, which in the case of the normal distribution is centered about the mean with a width of 3.92 standard deviations). Or, to put it in other words, the probability of finding more than 551 A-voters in another sample of 1,000 interviewees from the same population is 0.025. Bayesian statistics, as opposed to classical statistics, would argue from the same numbers that the probability is 0.95 that the population parameter falls within the interval $[0.489, 0.551]$.

CLEAVAGES
In political science, cleavages explain the underlying dimensions of contestation in countries as well as the formation and persistence of political party systems. But cleavages are more than just political divisions. In their seminal article “Cleavage Structures, Party Systems, and Voter Alignments” (1967), Seymour Martin Lipset and Stein Rokkan defined cleavages as having three main characteristics. First, a cleavage involves a social division that separates people by sociocultural or socioeconomic characteristics. Second, people involved in the division must be aware of their collective identity and must be willing to...
act on the basis of that identity. Finally, a cleavage must be expressed in organizational terms, such as political parties or interest groups. These characteristics not only distinguish a cleavage from a temporary issue-based conflict but also allow researchers to consider the persistence or decay of cleavages.

In Western Europe, four main cleavages defined the party systems of the post–World War II period (Lipset and Rokkan 1967). The national revolution yielded two potential cleavages: the religious and the center/periphery. Historians and political scientists alike recognize the significance of religious conflict in the formation of party systems. It pitted state builders against the church, especially in Catholic countries. The religious cleavage is unevenly distributed across Europe, being especially significant in those countries with a substantial Catholic minority or majority, such as Belgium, Germany, Italy, and the Netherlands (Lijphart 1999). In political terms, this cleavage contributes to the social left-right dimension in many countries on contested issues such as divorce, abortion, and gay rights. In the early twenty-first century a new religious cleavage may be emerging in European countries with significant Muslim minorities.

The center/periphery cleavage also arose during nation-building times, between centralizing forces and the peripheral peoples who sought to retain independence or autonomy. In almost all countries in Western Europe, there are organizational manifestations of regionalist or ethnic groups. The social characteristics that define this cleavage can be linguistic or ethnic differences. The center/periphery or cultural-ethnic cleavage is contested in all the societies that Arend Lijphart, in Patterns of Democracy (1999), considers plural, that is, having substantial cultural or ethnic diversity.

In plural societies, especially beyond the developed world, contestation over this cleavage may be associated with ethnic violence. But, as Robert Dahl, in A Preface to Democratic Theory (1956), argues, plural societies, like the United States, can achieve a level of democratic success if cleavages are cross-cutting rather than reinforcing. In other words, most individuals belong to more than one group and, so long as the memberships do not overlap, a coherent and tyrannical majority is unlikely to form.

In addition to the national revolution, the industrial revolution created or strengthened two additional cleavages. First, the national revolutions in Europe often pitted rural and agrarian interests against industrial entrepreneurs. Second, the industrial revolution crystallized the class conflict between workers and owners in many European countries. Politically, this cleavage manifests itself as the political-economic left-right dimension. As Lipset and Rokkan note (1967), the worker/owner cleavage is “the expression of the democratic class struggle.”

This cleavage remains the main dimension of political contestation in almost all advanced industrial democracies (Lijphart 1999).

In retrospect, party systems institutionalized the existing cleavages in European society. Thus, the Conservative party in Britain represented the owners against Labour, while elsewhere in Europe, Christian Democratic parties represented Catholic social doctrine. In the late twentieth century, many political scientists considered whether European party systems remained frozen around these underlying cleavages, or whether new cleavages had emerged, such as a postindustrial or postmaterialist cleavage. The concept of cleavage thus retains its significance in both theoretical and empirical research.

CLIENTELISM

Political scientists, sociologists, and anthropologists use clientelism to describe a certain type of relationship between individuals and larger groups of people that is not based on other types of relationships such as common class, ethnicity, or religion. In this sense, clientelism is a residual concept that can be used to explain strong patterns of allegiance and loyalty within larger groups in situations where they cannot be explained by other more traditional means.

Although definitions of clientelism vary, most suggest that at the level of individuals it involves a direct relationship between two people that is based on personal and intense feelings of comradeship and loyalty. From this starting point, larger clusters of such interpersonal relationships can form that result in the construction of collectivities such as labor unions and political parties. Regardless of the type of collectivity that is being studied, social scientists that use clientelism as a concept for explaining behavior share the view that the collectivity is
based upon a complex and sophisticated set of interpersonal relationships.

In the social sciences, this concept has been most extensively used by political scientists attempting to explain patterns of allegiance and loyalty either in urban settings or in rural areas where there are high concentrations of poor people. For example, there is a large body of literature that attempts to explain the nineteenth- and early-twentieth-century politics in cities such as New York, Chicago, and Boston in terms of the existence of personal networks in urban slums that connected individual workers and their families to ward healers, and eventually to the bosses who ran these cities. It is argued that this system of so-called machine politics was the result of a tacit bargain between leaders and followers. In exchange for jobs and favors from the bosses and their local representatives, the bosses were able to maintain loyal cadres of supporters who served as the basis for the establishment of modern political parties.

Because such machine politics in large U.S. cities came to be viewed by social scientists and citizens alike as a breeding ground for patronage and corruption, clientelism came to have a highly negative connotation. In fact, it came to be associated with the so-called primitive form of democratic politics practiced in developing regions of the world. During the 1960s and 1970s, a good amount was written concerning the specific nature of the pathology of clientelism in Asia, the Middle East, Africa, and Latin America. Perhaps because of its combination of emerging democratic politics, rapid industrialization, and feudal patterns of landholding, Latin America received more attention than any other developing region.

In Latin America clientelism was frequently referred to in terms of patron-client relationships. Historically, the patron was a large landowner who was able to offer his peasant “clients” physical protection and job security in exchange for his labor and political support. Given the largely feudal nature of many Latin American societies, the patron-client relationship was hierarchical (vertical) in nature. Such patron-client patterns have been used by political scientists to explain the history and evolution of parties and party systems in countries such as Mexico and Colombia.

Although the concept of clientelism is not used as extensively as it was during the 1960s and 1970s to explain political phenomena, it continues to prove beneficial for assessing developments in certain regions of the world. For example, it has been used to explain how Hizbollah (the Party of God) has been able to create a loyal following among Palestinian refugees living in Lebanon despite the fact that these refugees are not permitted to vote in Lebanese elections.

**CLINTON, BILL**

**1946–**

Bill Clinton was the forty-second president of the United States, serving from 1993 to 2001. He was born William Jefferson Blythe III on August 19, 1946, in Hope, Arkansas. His father, William Jefferson Blythe Jr. (1918–1946), was a salesman who died in an auto accident before Clinton was born. When Bill Clinton was fourteen, he legally adopted the surname of his stepfather, Roger C. Clinton Sr. (1908–1967).

While attending Georgetown University, Clinton interned with Senator J. William Fulbright (1905–1995) of Arkansas, a prominent critic of the Vietnam War (1957–1975). Avoiding military service, Clinton was awarded a Rhodes Scholarship to study at Oxford University in 1968 and earned a law degree from Yale University in 1973. While at Yale, Clinton met and later married fellow law student Hillary Rodham.

In addition to opposing the Vietnam War, Clinton worked in the 1972 Democratic presidential campaign and unsuccessfully ran for a congressional seat in Arkansas in 1974. In 1976 Clinton was elected attorney general of Arkansas. He was elected governor of Arkansas in 1978, but was defeated for reelection in 1980. In 1982 Clinton was again elected governor of Arkansas and served in this position until December 12, 1992. During his second stint as governor, Clinton projected a more moderate, populist image to Arkansas voters. His policies emphasized public school reforms, economic development, and tax relief for the elderly.

**THE 1992 PRESIDENTIAL ELECTION**

Bill Clinton formally announced his candidacy for the 1992 Democratic presidential nomination in Little Rock on October 31, 1991. After securing an impressive, sec-

The Democratic national convention of 1992 highlighted the need for generational change in the White House by nominating baby boomers Bill Clinton for president and Senator Al Gore Jr. of Tennessee for vice president. Clinton won the election with 43 percent of the popular vote. Perot's receipt of 18.9 percent of the popular votes enabled Clinton to carry most states in the Electoral College.

CLINTON'S FIRST TERM
With a Democratic Congress, Clinton signed into law the Family and Medical Leave Act of 1993, the Omnibus Budget Reconciliation Act of 1993, the Brady Handgun Violence Prevention Act of 1993, the AmeriCorps Act of 1993, and the North American Free Trade Agreement (NAFTA) in 1994. Clinton's inexperience in dealing with Congress was evident in his withdrawal of Lani Guinier's nomination as assistant attorney general for civil rights following criticism of her writings on affirmative action. The most controversial and unsuccessful domestic policy initiative of Clinton's presidency was his proposed Health Security Act, that is, a universal health-care plan. He appointed Hillary Clinton as the chair of the Task Force on National Health Care Reform and announced this task force's proposal in a speech to Congress on September 22, 1993. Public and congressional opposition to Clinton's plan increased as its complex, confusing details were criticized as socialized medicine by Republicans, conservative media commentators, and interest groups. The rejection of Clinton's health-care plan contributed to the Republican landslide in the 1994 congressional elections.

After the Republicans won control of Congress in 1994, Clinton repositioned himself as a moderate seeking bipartisan cooperation and compromise. His poll ratings steadily improved in 1995 and 1996 as the public perceived Republicans in Congress, especially Speaker of the House Newt Gingrich, as excessively conservative and unreasonable in their policy relationship with Clinton. Clinton, however, waited until after the 1996 Democratic national convention to sign the Welfare Reform Act of 1996, which most House Democrats opposed. With a prosperous economy and no major foreign policy crises, Clinton was easily reelected president in 1996.

CLINTON'S FOREIGN POLICY
Bill Clinton perceived the post–cold war era as an opportunity for the United States to improve and expand multilateral efforts to promote democracy, free trade, environmental protection, humanitarian relief, and the resolution of political and military conflicts in Northern Ireland, Bosnia, Somalia, and Palestine. Clinton ordered brief, unsuccessful U.S. military interventions in Somalia and Haiti. The United States also joined NATO allies in aerial bombings to end Serbia's "ethnic cleansing" and force an end to the war in Bosnia. Responding to Iraqi president Saddam Hussein's (1937–2006) expulsion of UN weapons inspectors and other violations of international law, Clinton publicly supported "regime change" in Iraq but limited his military response to launching cruise missiles.

Clinton wanted to avoid a stronger military response toward Iraq that might alienate European and Middle Eastern allies, the United Nations, and the American public. Following the 1993 terrorist bombing of the World Trade Center in New York City, however, Clinton signed into law tougher antiterrorism legislation. Nonetheless, George W. Bush's Republican presidential campaign in 2000 criticized Clinton for failing to effectively address Iraqi and other threats to national security.

SCANDALS, CONTROVERSIES, AND IMPEACHMENT
Before his sexual affair with White House intern Monica Lewinsky became a public issue in 1998, Clinton had experienced media, congressional, and judicial investigations into his sexual behavior in the lawsuit of Paula Jones, Hillary Clinton's involvement in the failed Whitewater investment, and his firing of employees in the White House travel office. Some conservative critics also accused Clinton of ordering the murders of Vincent Foster (1945–1993), the deputy White House counsel, and Secretary of Commerce Ron Brown (1941–1996). Foster's death was officially ruled to be a suicide, and Brown died in a plane crash in Croatia.

Independent counsel Kenneth Starr began to investigate Lewinsky's affair with Clinton because of contradictions between her testimony and Clinton's in the Jones case. At a January 1998 press conference, Clinton firmly denied having "sexual relations" with Lewinsky. Clinton continued to receive high job approval ratings, and the Democrats gained five House seats in the 1998 elections. Newt Gingrich soon resigned from the speakership and the House. Nonetheless, the House of Representatives impeached Clinton on charges of perjury and obstruction of justice on December 19, 1998. After a trial in the Senate, the Senate acquitted Clinton on February 12, 1999. Throughout these proceedings, polls indicated that
most Americans opposed Clinton’s impeachment, trial, and removal from office.

Bill Clinton devoted the remainder of his term to improving race relations, achieving a budget surplus, and negotiating a new trade agreement with China. In order to benefit Al Gore’s presidential campaign and Hillary Clinton’s Senate campaign in New York, he frequently reminded audiences of his administration’s domestic policy successes and the country’s prosperous economy. Wanting to avoid association with Clinton’s scandals, especially in fund-raising for the 1996 election, Gore carefully limited Clinton’s role in his unsuccessful 2000 presidential campaign. Some political analysts have argued that had Clinton been more involved in the campaign, Gore might have carried Clinton’s home state of Arkansas and his own home state of Tennessee. Winning these two states would have won the election for Gore, regardless of the outcome of the disputed electoral votes in Florida.

As Bill Clinton prepared to leave office in 2001, he attracted controversy when he pardoned Marc Rich. Rich was a billionaire who fled to Switzerland because of charges of tax evasion and violations of oil embargoes against Iran and Libya. Denise Rich, his wife, had previously made large contributions to the Democratic Party and Clinton’s presidential library and foundation.

PUBLIC PERCEPTION OF CLINTON DURING HIS PRESIDENCY

Americans generally expressed an ambivalent, complex perception of Bill Clinton. During his second term, most Americans gave Clinton high job approval ratings, especially on the economy, and opposed his impeachment while simultaneously perceiving him to be dishonest, politically expedient, and detrimental to the moral character of the presidency. Among specific demographic groups, Clinton attracted consistent, loyal support from African Americans, Jews, unmarried women, and young adults, along with consistent, staunch opposition from married white men, white Christian fundamentalists, and gun owners. Criticism of Clinton’s policies and personal character was hardened and intensified by the rise of conservative talk radio programs, the Fox news network, and the Internet.

POSTPRESIDENCY ACTIVITIES

Besides supervising his presidential library and foundation, Bill Clinton regularly traveled nationally and internationally as a well-paid public speaker. Clinton raised funds for his foundation, the Democratic Party, and philanthropy, especially AIDS research and treatment, environmental protection, and relief for victims of Hurricane Katrina and the 2004 Asian tsunami. In some of these charitable efforts, Clinton teamed with former president George H. W. Bush. After Senator Hillary Clinton became a candidate for the Democratic presidential nomination of 2008, Bill Clinton became more publicly prominent in his relationship with her when he and she performed a parody of the television show, The Sopranos.

CLIOMETRICS

From a purely etymological standpoint, the term cliometrics should have a very broad meaning. After all, Clio was the muse of history in ancient Greek mythology, and metrics comes from the Greek and Latin word for measurement. Hence, cliometrics could encompass any application of measurement to history, placing it in the same inclusive inventory of methods as biometrics, psychometrics, and econometrics. That is, it would represent a quantitative method that does for history what the others do for biology, psychology, and economics, respectively. Yet the term is most often applied to a very specific form of economic history, namely, that in which historical data are analyzed using modern economic theory and econometric methods. By this restricted application, it may be said to constitute a specialized branch of economics rather than a method in history.

HISTORICAL ORIGINS

Although it is always difficult to assign a precise date to any intellectual movement, cliometrics is often said to have begun with the 1958 article “The Economics of Slavery in the Ante-Bellum South,” which Alfred Conrad and John Meyer published in the Journal of Political Economy. Whether this was truly the genesis or not, a full-fledged cliometric revolution definitely took off sometime in the 1960s. In that decade it became apparent that the practitioners of standard economic history—many of whom were strictly historians rather than economists—had to confront those who advocated what was called the...
“new economic history.” In 1960 Douglass North, an early champion of this innovative approach, became coeditor of the Journal of Economic History, the official publication of the Economic History Association. Just a few years later the journal Explorations in Entrepreneurial History (soon renamed Explorations in Economic History) emerged as a major outlet for cliometric research. Also in the early 1960s Purdue University in Indiana became the site for annual cliometrics meetings where the new economic historians could present and discuss applications of the discipline’s theory and methods to history.

Once cliometrics began to enjoy a conspicuous presence in the research on economic history, the next step was for the practice to become institutionalized as a formal subdiscipline within economics. As noted on their Web site, this step was taken in 1983 with the founding of the Cliometric Society, which was explicitly identified as “an academic organization of individuals interested in using economic theory and statistical techniques to study economic history.” Although the cliometrics revolution began in the United States, the movement gradually spread to other countries that featured active scholarship in economic history, such as France and Germany.

CENTRAL CONTRIBUTIONS

The single most important sign that cliometrics had come of age occurred in 1993. In that year the Nobel Prize in economics was bestowed upon Robert Fogel and Douglass North, the two most prominent researchers in the field. Fogel and North were honored specifically “for having renewed research in economic history by applying economic theory and quantitative methods in order to explain economic and institutional change.” This was the first time that any economic historian had received this prestigious award. North’s contributions to cliometrics went well beyond his role as coeditor of the Journal of Economic History; he also wrote a series of now-classic volumes in the new economic history that illustrated the assets of the technique. Among these is the 1973 The Rise of the Western World: A New Economic History (with Robert Thomas).

Yet, in some respects, Fogel’s place in the history of cliometrics is even more striking. Indeed, he is sometimes described as the founder of econometric history as well as the person who actually coined the term cliometrics for the new methodology. These claims aside, it is his name that has been most strongly associated with the movement, and his involvement was apparent from the very outset of his career: His doctoral dissertation applied the innovative approach to the impact of the railroads on economic growth in the United States prior to the Civil War. This cliometric research was later published in Railroads and American Economic Growth: Essays in Econometric History (1964). One central feature of Fogel’s analysis was the use of “counterfactual” arguments. By a detailed cost-benefit analysis he investigated how the early U.S. economy would have been affected had the railroads not been built, an assumption clearly contrary to historical reality.

Another basis for Fogel’s prominence is the highly controversial nature of the research he conducted with Stanley Engerman on the economic profitability of slavery in the antebellum United States. Their conclusions were published in Time on the Cross: The Economics of American Negro Slavery (1974). This book consisted of two volumes, the first devoted to scrutiny of the basic substantive issue, the second assigned to a detailed discussion of their data sources and statistical analyses. Because Fogel and Engerman showed that slavery was indeed profitable and that black slaves were in certain ways better off than white industrial laborers in northern cities, some critics accused them as composing an apology for slavery, that “peculiar institution.” Yet that accusation was unjustified. The authors were simply arguing that slavery constituted an efficient means of production—however morally repugnant.

GENERAL CRITIQUE

The cliometric revolution of the 1960s and 1970s was supremely successful. It began as a movement led by a few “young turks” against an “old guard” who dominated the leadership positions of the profession. Still, in less than twenty years the new economic history emerged as the prevailing approach in the discipline. Moreover, because cliometrics applied macroeconomic models and econometric methods, its proponents had much more in common with economists than with historians. As a result, departments of economics at major U.S. research universities became increasingly inclined to hire cliometricians rather than conventional economic historians. In a sense, economic historians had been replaced by historical economists, that is, by scholars who differ from their colleagues mostly in that they use older rather than newer data.

Despite this apparent success, the victory was not absolute. Although cliometrics dominates economic history in its country of origin, it has had somewhat less success abroad. For instance, at the beginning of the twenty-first century a bona fide cliometric revolution had yet to take place in German economic history. Moreover, the procedure still has its vocal critics. Some observers believe that cliometrics has relied too heavily on standard macroeconomic models that cannot capture the complexities of the economic systems being analyzed. Other critics doubt whether the available historical data can bear the weight of econometric inferences, particularly when they
entail strong counterfactual arguments. Even so, it seems likely that cliometrics will continue to consolidate its presence within economic history. This prognosis is supported by the founding of the French Cliometric Association in 2001. Furthermore, in 2007 this association, in collaboration with the Cliometric Society, began publishing *Clometrica: Journal of Historical Economics and Econometric History*. Hence, the growth curve for cliometrics still exhibits an upward trajectory.

At least this conclusion holds for cliometrics in its narrow meaning. If the term is used according to its broader etymology, quantitative history has made much less progress outside of economics. For instance, research devoted to the quantitative but psychological analysis of historic creators and leaders—more often called *historiometrics*—remains a peripheral enterprise within psychology. Cliometrics may have had a more intrinsic connection with economics than it did with other disciplines that occasionally analyzed historical data. More specifically, economics is not only highly quantitative but also strongly historical insofar as change and growth are crucial components of economic theory and analysis. Hence, the supremacy of cliometrics may remain confined to economics, thereby justifying a restricted conception of the term.

**CLOCK TIME**

Throughout most of history, the passage of time was registered by familiar regularities such as day and night and the phases of the moon, or more accurately by the apparent motions of certain stars. The second was defined by the ancient Babylonians to be 1/84,600 of a day. Modern calendars are still based on *astronomical time* using the Gregorian calendar, introduced in 1582, in which the year is defined as 365.2425 days.

Until the scientific revolution and the ages of exploration and industrialization that followed, most people had no need for accurate clocks. Farmers and fishermen measured time in relation to familiar processes in the cycle of work and domestic chores. Labor took place in the natural period from dawn to dusk. The sundial was widely used to tell time during the day. The great advance in the accuracy of household clocks came about in the mid-seventeenth century with the application of the pendulum, which had been introduced into scientific experiments by Galileo in 1602. English clock- and watchmaking became dominant in 1680 and remained so until competition from the French and Swiss caught up about a century later.

In 1759 John Harrison produced a clock that could keep exact Greenwich Mean Time (the mean solar time of the meridian of the Royal Observatory in Greenwich, England, used as the prime basis of standard time) at sea, enabling mariners to determine their longitude on the globe and making accurate marine navigation possible for the first time. Today the primary time standard is provided by a Cesium Fountain atomic clock at the National Institute for Standards and Technology laboratory in Boulder, Colorado, which will not gain or lose a second in more than 60 million years.

With the rise of science, the second has undergone several redefinitions to make it more useful in the laboratory. The most recent change occurred in 1967, when the second was redefined by international agreement as the duration of 9,192,631,770 periods of the radiation corresponding to the transition between the two hyperfine energy levels of the ground state of the Cesium133 atom at rest at absolute zero. The minute remains 60 seconds, the hour remains 60 minutes, and the day remains 24 hours, following ancient traditions. The day is still taken to be 84,600 seconds, as in ancient Babylonia. Modern calendars need to be corrected occasionally to keep them in harmony with the seasons because of the lack of complete...
synchronization between atomic time and the motions of astronomical bodies.

Nothing seems so ubiquitous—so absolute and universal—as time. Yet, in his 1905 "special theory of relativity" Albert Einstein showed that the times measured on clocks are different for clocks that are moving with respect to one another—an effect called "time dilation." This called into question some of the deepest intuitions of time. No moment in time can be labeled a universal "present." There is no past or future that applies to every point in space. Two events separated in space can never be judged to be objectively simultaneous. The whole notion of cause and effect has to be carefully rethought.

Unless one is making highly precise measurements with atomic clocks, time dilation is important only when the relative speeds of clocks are near the speed of light, so there are not noticeable effects in everyday life. However, Einstein's theory has been confirmed by a century of experiments involving high-energy particles that move near the speed of light, as well as low-speed measurements with atomic clocks. Although it is not necessary to take into account the relativity of time in the social sphere, it is important not to draw universal, philosophical, or metaphysical conclusions based on notions related to time that are inferred from normal human experience.

Philosophers and theologians have introduced alternate "metaphysical times" more along the lines of common experience, but these have no connection with scientific observations. Scientific models uniformly assume that time is, by definition, what is measured on a clock and that time is relative.

**CLUB OF ROME**

Founded in Rome in early 1968 by a group of European businessmen and scientists, the Club of Rome is a non-profit nongovernmental organization (NGO) that serves as an international think tank on global issues. The Club of Rome is run by an Executive Committee of eleven members that appoints a president, vice presidents, a secretary-general, and a treasurer. The president of the club represents the organization to the outside world; HRH Prince El Hassan bin Talal of Jordan became president of the Club of Rome in 1999.

Individual membership in the Club of Rome is restricted to those who are elected by the Executive Committee. There are three levels of individual membership. (1) Active members are persons of established reputation whose work is international in scope and whose views on global issues are congruent with the Club of Rome. Serving terms of five years, the number of active members is limited to one hundred. The Club of Rome's professed aim is to balance membership in this category by regions, cultures, professions, age, and gender. The public listing of active members reveals men and women from such fields as banking, private industry, academe, government (both elective office and bureaus), and other NGOs. (2) Associate members are individuals who are involved with the work of the club or wish to cooperate in the future. They may apply for membership or be recommended by a member of the club and are elected by the Executive Committee for five-year terms. Again, associate members are drawn from those who have attained distinction in a variety of fields, though those from academe and research institutes dominate this category. (3) Honorary members are persons of high reputation or office whose work can support the mission of the club. Honorary members must be proposed by a member of the club and are elected by the Executive Committee. The membership of this group is dominated by former high government officials, though there are a few academics as well.

The professed mission of the Club of Rome is to “act as a global catalyst of change” by sponsoring studies and conferences and issuing reports and news releases that focus on long-term global problems and their interrela-
The club is committed to an interdisciplinary perspective that highlights both the increasing interdependence of and problems among nation-states. From its first report in 1972, titled *The Limits to Growth*, the Club of Rome has dedicated itself to identifying the most critical problems facing humanity; analyzing the interrelationships of these problems on the basis of an interdisciplinary, holistic, and global perspective; and positing future scenarios based on humanity’s response to these problems. The club has identified a number of significant global issues, referred to as *world problematique*, facing humanity, including: depletion and pollution of the environment; demographic problems of both growth and aging; uneven development within and between nations; the decline of traditional values; dysfunctional governments; the quality and distribution of work; the sociocultural impact of new technologies; dysfunctional educational systems; the globalization of the economy; and international financial disorder.

The best-known report sponsored by the Club of Rome was its first, *The Limits to Growth*. The book was based on multiple simulations of a “systems dynamics” computer model of five major human activities: industrial production, population, agricultural production, resource use, and pollution. The basis of systems dynamics is the assumption that the often complex and intricate interrelationships between components of a system are essential in determining the behavior of the components as well as of the overall system itself. Accordingly, levels and rates of change in each of the sectors were interrelated through mathematical formulae that sought to simulate the impact of growth in one sector (for example, a growth in agricultural production) on levels and rates of change in the other four sectors. The model was then run under differing assumptions regarding physical limits to growth (supposing the known reserves of resources versus doubbling those known reserves). The results of the simulations lent support to the idea of physical limits to continued growth consisting of resource depletion and pollution, with the authors arguing that if present growth trends continue, these limits will probably be reached within the next century; the typical mode of hitting these limits was one of “overshoot and collapse.” Rather than a simple prediction of doom, however, the report argues that the world can move quickly to establish a condition of economic and population stability that is sustainable and a state of global equilibrium that more equitably distributes resources to each person on earth.

The Club of Rome’s main focus is upon global problems associated with population and economic growth. It espouses a neo-Malthusian agenda of limiting population growth and promoting sustainable economic development in order to address perceived problems of environmental degradation.

**Cluster Analysis**

Quantitative social science often involves measurements of several variables for a number of cases (individuals or subjects). Searching for groupings, or clusters, is an important exploratory technique. Grouping can provide a means for summarizing data, identifying outliers, or suggesting questions to study.

A well-known clustering is that of stars into a main sequence, white giants, and red dwarfs, according to temperature and luminosity. The military has used cluster analysis of anthropometric data to reduce the number of different uniform sizes kept in inventory. Cluster analysis in marketing is called *market segmentation*; consumers are clustered according to psychographic, demographic, and purchasing behavior variables. The United States has been divided into a number of clusters according to lifestyle and buying habits.

Establishing the *profile* of a case, an observational unit, is the first step in cluster analysis. The profile of a case is its pattern of scores across a set of correlated variables. Cases with similar profiles should be in the same cluster; cases with disparate profiles, in different clusters. The mean profile of a cluster is the centroid, the set of means of the variables, for the individuals in that cluster. Cluster profiles provide a good summary of the data. Examining them provides insight as to what the clusters mean. A cluster’s profile can suggest an interpretation and a name for it.

There are two broad types of clustering algorithms: hierarchical clustering and nonhierarchical clustering (partitioning). Hierarchical clustering follows one of two approaches. *Agglomerative clustering* starts with each case as a unique cluster, and with each step combines cases to form larger clusters until there is only one or a few larger clusters. *Divisive clustering* begins with one large cluster and splits it into smaller clusters.
There are several ways to define intercluster distance. This can be done by forming all pairs of objects, with one object in one cluster and one in the other, and computing the distances between the members of these pairs. Single linkage is based on the shortest of these; complete linkage on the longest; and average linkage on their mean. Joe Ward's method (1963) is based on the sum of squares between the two clusters, summed over all variables. The centroid method is based on the distance between cluster centroids.

Nonhierarchical clustering is partitioning of the sample. The K-means algorithm assigns each case to the cluster having the nearest centroid. The process begins by partitioning the cases into K initial clusters and assigning each case to the cluster whose centroid is nearest. The centroids of the cluster receiving the new case and the cluster losing the case are updated. This is repeated until no more reassignments take place. The ISODATA algorithm is similar to K-means, except one loops through all cases before the centroids are updated. An alternative to starting with an initial clustering is to start with an initialization of the centroids—e.g., as the first K cases in the dataset or as K cases randomly chosen from it.

The notion of nearest requires a notion of distance. Often, rightly or wrongly, researchers use Euclidean distance, which is the length of the hypotenuse of a right triangle formed between the points. Euclidean distance is appropriate for variables that are uncorrelated and have equal variances. Standardization of the data is needed if the range or scale of one variable is much larger than that of others. Mahalanobis distance (statistical distance), which adjusts for different variances and for the correlations among the variables, is preferred.

It is sometimes suggested that researchers start with hierarchical clustering to generate initial centroids, and then use nonhierarchical clustering. A conceptual model for clustering is that the sample comes from a mixture of several populations. This leads to a mathematical probabilistic model called the finite mixture model. If the within-cluster type of distribution is specified (such as multivariate normal), then the method of maximum likelihood can be used to estimate the parameters. This is done with an iterative algorithm.

There are several procedures for determining the number of clusters. This task should be guided by substantive theory and the practicality of the results. A criterion such as between-groups sum of squares or likelihood can be plotted against the number of clusters in a scree plot. When a normal mixture model is used, model selection criteria such as Akaike information criterion (AIC) and Bayesian information criterion (BIC) can be used.

Once the clusters are formed, researchers can use discriminant analysis to determine which variables account for the clustering and to classify new cases into the clusters. Some cluster techniques operate on distances or similarities rather than raw data. Variables can be clustered using their correlations as similarities. Simultaneous clustering of cases and variables is called block clustering. If a subset of the cases has similar values on a subset of the variables, these cases and variables form a block.

James MacQueen's development of his K-means algorithm (1967) was a milestone in the development of clustering analysis. John Wolfe (1970) was the first to program maximum likelihood clustering for the finite normal mixture model. John Hartigan's Clustering Algorithms (1975) did much to stimulate interest in cluster analysis. Geoff McLachlan and David Peel's Finite Mixture Models (2000) is a comprehensive presentation of model-based clustering.

**COALITION**

The term coalition encompasses a wide range of political activities and outcomes. At the most basic level, a coalition is said to exist when two or more political groups or actors agree to pursue some common objective(s), pool resources in pursuit of such common objective(s), and actively communicate during joint action to achieve such common objective(s). In contrast to the competitive, majoritarian, “winner-take-all” approach to politics, coalitions emphasize collaboration and group coordination. Understanding coalitions helps scholars and practitioners answer one of the immutable questions of politics: Why do avowed adversaries sometimes cooperate? If politics is largely about bargaining and compromise, then the transformation of political competitors into allies is of the utmost importance, whatever the situation, setting, or scope.
Researchers and theorists ask three classes of questions about coalitions: those concerning coalition formation, those concerning coalition maintenance, and those concerning coalition termination. Observers of coalition formation attempt to explain, and purport to predict, the outcomes and payoffs to political actors engaged in bargaining over the composition of a coalition. Much less studied but no less important is coalition maintenance—the concerns of coalition maintenance shift analysis from outcomes to processes, asking questions about communication among partners, joint decision making, policy output, and the efficacy of an alliance. A more recent scholarly concern with coalition termination seeks to identify the sources and consequences of coalition breakup.

As a basic unit of analysis in political science, coalitions are scrutinized as they occur among such actors as interest groups in society, political parties in the electorate, legislative factions in representative assemblies, and states in the international arena. There are, for example, constellations of small grassroots groups that coalesce as social coalitions to advance a shared agenda (as illustrated by the Rainbow/PUSH Coalition for advancing civil rights in the United States). There are electoral coalitions in which cooperating political parties agree to transfer voter support to one another in districts where doing so enhances the likelihood of victory (as in France’s double-ballot system for parliamentary elections). There are ad hoc legislative or voting coalitions in which members of political parties agree to join forces in support of specific policy or legislation (as in the U.S. Congress).

Perhaps most prominent in the political science literature on coalitions is the scrutiny given to power sharing or governing coalitions, in which political parties agree to collaborate in the joint distribution of cabinet posts and government ministries. Often, small minority parties located strategically in between major party blocs become “kingmakers,” holding disproportionate power to make or break a winning coalition. Outside the Anglo-American democracies, from Italy to Israel and Belgium to Germany, such governing coalitions are typically the norm in parliamentary systems. In international politics, strategic alliances linking two or more states in pursuit of some commonly shared objective may be referred to as coalitions (as in the case of the United States’ “coalition of the willing” designed to oust Saddam Hussein’s regime in Iraq). A rich body of literature seeking to develop and test coalition theories has focused on the motivations that lead political actors to pursue coalitions of different sizes (minimum-winning coalitions or oversized coalitions), ideological complexities, and novelty.

**William M. Downs**

**COALITION THEORY**
Political scientists, along with counterparts in other social science disciplines, have sought a number of theoretical approaches to describing, explaining, and predicting coalitional behavior. Coalitions arise in situations with at least three actors (individuals, groups, countries), wherein no single actor can achieve an optimal outcome on its own; rather, cooperation with one or more other actors is necessary. Coalition theories purport to shed light on why alliances emerge, why they take the forms they do, how they endure, and why they collapse.

Much of coalition theory embraces the basic assumptions of rational political behavior. Faced with dilemmas about how to maximize gains through cooperation with one or more other parties, rational political actors will weigh preferentially ordered alternative strategies and consistently pursue coalition options connected with more preferred outcomes. The game-theoretic tradition, which has dominated coalition research, flows directly from this foundational assumption of rationality. Game theorists view the process of coalition formation as a social interaction in which bargaining behaviors can be modeled by a priori assumptions and deductive propositions about what the negotiators value most.

Conventional coalition theory generally makes four assumptions: relevant players in the coalition game are unified parties, each of which can be considered a single bargaining entity with indivisible motives; the coalition game is zero-sum, with gains by one party constituting losses for another; the universe of possible coalitions is formed by all “winning” combinations of actors; and the game of coalition formation is a single-shot event, independent of previous or future bargaining between the par-
ties to the game. From these baseline assumptions, formal coalition theory has advanced at least two major strands of research: size-criterion studies (the “office-seeking” tradition) and ideological/policy distance (the “policy-seeking” tradition).

In his 1962 book William Riker deduced a “size principle” by which in $n$-person “games” coalitions of minimum size would be expected to form. Hoping to craft a minimum-winning coalition large enough to win but no larger, rational actors in Riker’s model would, for example, consistently decide to form coalitions of no more than 201 members in a 400-seat parliament. Similarly, in the hypothetical 400-member parliament a coalition of two equally powerful parties combining for 60 percent of the seats would be preferred to a coalition of four equally powerful parties with 60 percent of the seats. The clear assumption is that the overwhelming motivation of rational political actors in coalitional situations is the zero-sum maximization of a fixed prize to be shared among the fewest actors possible. Self-interested actors driven by garnering for themselves the largest share of a fixed-sum prize tend to see the virtues of compromising principles or policies if doing so increases the likelihood of winning.

Advocates of a rival policy-seeking theoretical approach to understanding coalitions countered that actors seek to build alliances with those partners closest to them ideologically and do not simply jump to form alliances with any constellation of “strange bedfellows” that produces victory. In this theoretical camp, articulated most clearly by Abram De Swaan in his seminal 1973 book, the argument is that players in the coalition game seek to minimize the range of policy disagreement and ideological heterogeneity among members of a potential winning coalition. In a legislative context, this anticipates that the most frequent type of coalition found would be those in which members of the winning government would be adjacent or “connected” if placed on an ordinal, single-dimension left-right ideological scale.

Coalition theory has developed considerably since the pioneering works of Riker, De Swaan, and others. Scholars now seek to replace the traditional office-seeking versus policy-seeking dichotomy by borrowing from spatial theories of party competition to model bargaining on the basis of multiple policy dimensions. Still, criticisms of traditional coalition theory abound. Detractors contend that formal theories based on rational choice/game theoretic propositions fail to capture the practice and reality of coalition politics. Models of unconstrained minimalist rationality operating within the context of laboratory-pure “games,” say the critics, cannot account for the frequent departures from minimum-winning coalitions (namely, the occurrence of oversized “surplus majority” coalitions or undersized “minority” coalitions). Further, it may be wrong to assume that all coalition actors pursue the same goals, behave as monolithic unitary actors, and engage in the same kind of complex calculus of mathematical alternatives. Whereas some political scientists see the way forward as a choice between formal coalition theory (based on deductive assumptions about rational behavior) and rich description (detailing cases and actor characteristics), others claim such a choice to be a false dichotomy. Advancing knowledge about political coalitions, this latter group contends, will come through systematic and meaningful measurement of structural features that constrain rational behavior.

Economist Ronald Harry Coase was born in Middlesex, Great Britain, in 1910. At the age of eighteen, Coase enrolled at the London School of Economics, studying for a bachelor of commerce degree. He passed his degree examinations in 1931, and "knew a little about economics as well as a little about law, accounting, and statistics" (Coase 1991a, p. 37). After graduating, he was awarded a traveling scholarship, which brought him to the United States to study the structure of American industry. In 1932 Coase started his academic career in Great Britain as an assistant lecturer at the Dundee School of Economics and Commerce, where he was a colleague of Duncan Black (1908–1991). Subsequently, Coase worked at the University of Liverpool (1934–1935) and the London School of Economics (1935–1951). In 1951 he moved to the United States, where he taught at the University of Buffalo (1951–1958) and the University of Virginia (1958–1964) before joining the economics faculty at the University of Chicago in 1964. He remained there until his retirement in 1981. While in Chicago, he also served as editor of the Journal of Law and Economics (1964–1982).

In 1991 Coase was awarded the Nobel Memorial Prize in Economics, primarily on the basis of his paper “The Nature of the Firm,” published in Economica in 1937. In this paper, Coase asks why there should be a coordinating organization “in view of the fact that it is usually argued that co-ordination will be done by the price mechanism?” (Coase 1937, p. 388). In addressing this question, Coase strikes gold when he introduces the concept of transaction cost: “The main reason why it is profitable to establish a firm would seem to be that there is a cost of using the price mechanism” (p. 390). This explanation brings the firm and any other organization or institution within the economic domain. It creates neoinstitutional economics. Rereading his own paper years later, Coase claims to have been struck by its extreme simplicity (Coase 1991b, p. 52).

Another paper cited by the Swedish Academy when awarding Coase the Nobel Prize was “The Problem of Social Cost” (1960). This paper elaborates on a question posed in Coase’s earlier article “The Federal Communications Commission” (1959), a question similar to that posed in “The Nature of the Firm”: Why does etheric scarcity require government regulation, whereas for other scarce means, such as capital and labor, the price mechanism is used? Coase argues that the absence of property rights blocks the use of the price mechanism to allocate the etheric scarcity to its highest bidder. At the same time, in a zero-transaction-cost world, all welfare effects, side effects included, will be traded efficiently. This idea is what economist George Stigler (1911–1991) termed the Coase theorem (Stigler 1966, p. 113). Assignment of property rights may reduce transaction cost and induce trade, for example, in externalities.

Coase’s position is that a transaction cost is positive, underlining that this cost profiles economic transactions and their accompanying social arrangements. Otherwise, economic theory may result in “blackboard economics,” that is, formulating economic theory without taking account of information problems. Coase has a coherent view of the economic system, which he owes to his London School of Economics master Arnold Plant (1898–1978), who he claims “introduced me to Adam Smith’s ‘invisible hand.’” (Coase 1991d, p. 229). This view enabled Coase to formulate his seminal 1937 paper as “a young man who knew virtually no economics” (Coase 1991c, p. 62). Coase shows the normal working of the economic system in the light of transaction cost. The winning of the Nobel Prize induced Coase to remark: “It is a strange experience to be praised in my eighties for work I did in my twenties” (Coase 1991d, p. 231).

COASE THEOREM

In 1960 Ronald H. Coase, who won the Nobel Prize in Economics in 1991, published his paper *The Problem of Social Cost*. It presents the Coase Theorem as a new perspective on external effects, particularly harmful effects. Coase formulated his theorem as follows: “With costless market transactions, the decision of the courts concerning liability for damage would be without effect on the allocation of resources” (1960, p. 10). This theorem floors Arthur Pigou's welfare-economic approach of externalities. Since the publication of Pigou's *The Economics of Welfare* (1920) economists were used to seeing externalities (side effects) as divergences between private and social net products. In this respect, the conventional thought is that if A inflicts harm on B, A should be restrained. The harm is a (social) cost to B, not having been taken account of in A's private-cost-benefit calculation. Governmental interventions such as taxes remedy this private-social-product divergence, as a prerequisite for economically efficient decisions in the market place. This is the Pigovian approach.

The case of *Sturges v. Bridgman*, used by Coase, may illustrate the Pigovian approach, and shows that the Pigovian route runs into serious problems: For many years, a confectioner has had some machinery in operation on his premises. A doctor then occupies neighboring premises. After some years, the doctor builds a consulting room right next to the room containing the confectioner's machinery. The vibration and noise produced by the confectioner's machinery makes the doctor's use of the consulting room impossible, resulting in an income loss of, say, $100. The doctor goes to court and the court orders the confectioner to refrain from using his machinery. This judgment matches the Pigovian line of thought. The confectioner's production decision did not take the doctor's (social) costs into account. At the same time, the sentence makes clear that considering the problem in terms of private and social products ignores the reciprocal nature. Suppression of the confectioner's harm to the doctor inevitably harms the confectioner. It might be that the sentence harms the confectioner for more than $100. In that case, it is inefficient to ban the confectioner's business. The social net product is less than it might be.

Coase's perspective on the problem of social cost is “to avoid the more serious harm” (Coase 1959, p. 26).

Coase formulated this starting point of his theorem in a paper preceding the “Social Cost” paper. In his paper, “The Federal Communications Commission” (1959), Coase wondered why etheric scarcity requires government regulation, whereas for other scarce means such as capital, labor, and land the American economic system uses the price mechanism. Coase identified that it is the absence of property rights in radio frequencies that blocks the use of the pricing system. Well-defined property rights for frequencies will lead to wave trade, allocating a frequency to the highest bidder. “Chaos disappears; and so does the government except that a legal system to define property rights and to arbitrate disputes is, of course, necessary” (p. 14).

In his “Social Cost” paper Coase elaborated this property-rights perspective. Referring to the *Sturges v. Bridgman* case, the liability sentence affects the property rights concerning the neighboring premises, and foremost defines these property rights. The confectioner's liability will induce him to indemnify the doctor if his business brings him an income higher than the doctor's harm of $100. Similarly, the confectioner will move his machinery if this option costs less than $100. On the other hand, if the sentence had been that the doctor had no right to stop the confectioner's business, the doctor might pay the removal option, if priced at less than $100. Property rights bring about trade when mutual benefits are present. It must be said that the cost of transaction may hinder a beneficial deal. However, the Coase Theorem claims that market transactions allocate property rights to the highest bidder provided that transaction cost is zero.

Coase regretted that the zero-transaction-cost-world assumption of the theorem, in which “people can negotiate their way to efficiency” (Farrell 1987, p. 113), has received so much emphasis in the economics literature. People certainly do not live in such a world. Therefore, the most compelling message of the Coase Theorem is to take into account positive transaction cost in fashioning social arrangements. Key variable transaction cost should urge lawyers and legislators to identify in what manner the social net products might be increased. An elaboration of the Coase Theorem is the creation of air-polluting-emission rights. These rights induce polluters to seek emission-reduction alternatives, opening options to sell the rights profitably to the highest bidder.

COBWEB CYCLES

Cobweb cycles are the result of lagged response of commodity production to price changes, due to the intrinsic delay between production decisions and actual supply of goods. The typical example is agricultural production, where gestation lags can vary from one season (as with corn) to a few seasons (livestock) to some years (fruit trees).

The idea is rather old: It was applied to agricultural cycles in the 1820s, and it provided the basis for a non-agricultural cycle model by John Wade in 1833. In more recent times, Albert Aftalion’s business cycle theory also relied on prices sending wrong signals to entrepreneurs because of a lag between production and supply preventing the system from settling into equilibrium (1913). The first analytical treatment, however, came in 1930, when the independent researches of Jan Tinbergen, Umberto Ricci, and Henry Schultz (all published in German) looked at such cycles as examples of the introduction of time lags in the adjustment process after a disturbance to equilibrium in the commodity market occurs. These authors, elaborating on Arthur Hanau's finding that hog production in Germany was influenced by past hog prices, showed that lags generate two-phase discontinuous cycles, of a period twice the lag and of constant, increasing, or decreasing amplitude depending on the relative elasticities of the supply and demand curves. Figure 1, which represents the diverging case, is self-explanatory as to the origin of the term cobweb cycle (apparently coined by Kaldor 1934 in English and by Leontief 1934 in German).

In 1934 Wassily Leontief examined the case of non-linear supply and demand curves, and showed that certain conditions can give rise to persistent limit cycles, to which the system would converge.

The analysis was further generalized in two directions. The simplest treatment assumed that production decisions react on the market price prevailing at the time, thus implying specific rules about the formation of expectations. A first generalization considered distributed lags, either by treating the expected price as a weighted average of past prices, or by supposing that producers react not to

---

immediate price variations but to their expectation as to
the “normal” price level; the latter is revised period after
period, adapting it to the movement of actual prices
(Nerlove 1958). This stabilizes the model to some extent,
the more so the less the weight of recent events with
respect to past ones.

A second generalization disposed of the determinism
of the model by introducing an error term. The corre-
sponding modelling develops the suggestion derived from
John Muth’s observation that “farmers’ expectations and
the prediction of the model have the opposite sign” (Muth
have been elaborated assuming instead that expectations
are rational, thus postulating that they are unbiased with
respect to the theory’s prediction—that is, not systemati-
cally wrong in an easily predictable way (see, for example,

As these developments of the simplest model
occurred, the reflection on the epistemic implications of
the cobweb phenomenon was turned on its head. Its first
formulation immediately suggested that the instability
potentially caused by the lag could offer an escape to the
contradiction, widely perceived in the 1920s and 1930s,
between the persistence of cycles and the dominant static
economic theory, which postulated that a disturbed sys-

The reflections on expectations brought the discus-
sion about how to explain the cycle back to its starting
place. The assumption of adaptive expectations itself
implied an increased stability of the system by electing
the long-run normal price as the determinant of output (Mills
1961, p. 334). Finally, the postulate that expectations are
rational assumes the cycle away, except as the consequence
of the summation of random exogenous shocks on which
the burden of the explanation is shifted (Muth 1961, p.

**CODETERMINATION**

Codetermination guarantees worker representation in the management of a firm. It is commonly found in coordinated market economies such as Germany. Liberal market economies, such as the United States, typically do not legislate mandatory worker representation in firms.

Germany introduced codetermination in 1951, establishing employee participation at two levels of corporate governance: the firm level, with works councils, and a higher level, with employee representatives on the supervisory board. Employee representation is most extensive in the coal, iron, and steel industries, where near parity is legislated, nominally giving equal representation to employees and employers. In 1976 the German government extended codetermination to other industries, but without full parity (European Foundation 2005c). Under these rules, worker representation is extensive but not uniform across issue areas. Most significantly, workers have a voice on issues that concern health and safety at work, personnel matters, training, and renumeration (European Foundation 2005d).

In Austria codetermination allows employees to influence firm decisions that affect their employment conditions, but it is limited to disciplinary procedures and some renumeration matters where firms must receive the works council’s approval before making changes (European Foundation 2005a). Codetermination reinforces norms of trust between firms and employees, yielding an environment of relatively peaceful industrial relations.

Sweden established rules in 1976 that promoted employee participation in firm decision making, but the laws pertain only to firms that have collective bargaining agreements with their unions (European Foundation 2005e). Similarly, the 1978 Co-operation Act in Finland regulates industrial relations, allowing employees to participate in decision making on limited matters, including training and worker welfare (European Foundation 2005b). Although the policies in Sweden and Finland are often called codetermination, the policies are neither as extensive nor as broadly applicable as in Germany. Thus, the institution of codetermination varies across countries, industries, and issue areas.

As the barriers to trade and labor mobility are lowered in the European Union, analyzing the costs and benefits of codetermination is critical. In the case of full parity, as in the coal and steel industries in Germany, board members perceive slower decision making due to worker inclusion as a significant disadvantage (Hopt 1984). This cost must be balanced against the advantages of trust and information sharing. In a more recent survey in Sweden, for instance, a majority of directors had a “rather positive” or “very positive” view of worker representation on employee boards. And in fact, the Swedish survey demonstrated that codetermination actually increased efficiency (Levinson 2001, pp. 265–266).

Further, increased worker representation should result in better working conditions for employees and for greater industrial peace; otherwise, either workers or employers would oppose the policy. Analysis of hourly earnings confirms that codetermination does increase hourly earnings (Svejnar 1981, p. 194). Codetermination also seems to have a positive effect on cooperation between firms and their employees (Levinson 2001, p. 266).

Nevertheless, codetermination may not be suitable for every country or firm. Legislating codetermination in multinational corporations is complicated by legal and economic factors, as the Netherlands implicitly acknowledges by granting multinational corporations exemptions from codetermination (Hopt 1984, p. 1363). Also, codetermination is a characteristic of coordinated market economies, where coordination by nonmarket mechanisms is critical to economic success (Hall and Soskice 2001). Mandating codetermination in liberal market economies may be counterproductive because the market itself provides the critical source of coordination, providing comparative advantages.

Coffee Industry

Seth Jolly

COFFEE INDUSTRY

The coffee plant is a woody perennial evergreen belonging to the Rubiaceae family. There are two types of coffee, arabica (Coffea arabica) and robusta (Coffea canephora). Arabica, which accounts for about two-thirds of global output, is grown at high altitudes in Latin America and northeastern Africa. It has more aroma and less caffeine than robusta, which is grown in humid areas at low altitudes in Asia and western and southern sub-Saharan Africa. The coffee plant can grow up to 10 meters high, but it is usually kept at about 3 meters. It takes two to three years for the coffee plant to produce cherries. Scientific evidence indicates that arabica is indigenous to Ethiopia, while robusta is indigenous to Uganda. It appears that coffee was produced in Ethiopia at a larger scale and then spread to other parts of Africa. Coffee cultivation was introduced to Java by Dutch traders in 1699. A few years later the French introduced coffee to Martinique. Coffee was first cultivated in Brazil in 1727.

Although the origins of the coffee drink are unknown, the usefulness of coffee beans was probably recognized as early as 1000 CE by Arab traders who chewed coffee beans in order to suppress their appetite and stay awake, thus helping them cross large distances in the desert. The world’s first coffee shop reportedly opened five centuries later in Constantinople (now Istanbul, Turkey). Coffee was introduced to the West by Italian traders in the early seventeenth century, with the first coffee shops opening in London and Paris later in that century.

The processing of coffee involves several steps. After harvesting, the skin of the cherry is removed, and the bean is cleaned to become a green bean, the internationally traded commodity. The green beans are roasted, giving them a dark brown color. Following the grinding of roasted beans, consumers use various brewing techniques to convert the ground beans into a beverage. In Europe, most coffee is consumed in espresso-like form, whereas in North America coffee is mostly consumed in drip form (although that practice has been changing since the beginning of the “Starbucks revolution” during the 1990s). In Asia, most people drink instant coffee. Scandinavian countries lead the world with per capita consumption of almost 10 kilograms of coffee per year from 2000 to 2005. The European Union average during this period was 5.0 kilograms, followed by the United States (4.1 kilograms), and Japan (3.2 kilograms), according to U.S. Department of Agriculture estimates (USDA 2006).

PRODUCTION, TRADE, AND PRICES

Most tropical countries produce coffee. Latin America accounts for 60 percent of global output, followed by Asia (24%) and Africa (16%). From 2001 to 2006, more than half of world output was produced in three countries: Brazil (35%), Vietnam (11%), and Colombia (10%). Other significant producers were Indonesia (5%) and Ethiopia, India, and Mexico (4% each). Coffee in some countries, notably Brazil, is produced on large farms with modern equipment, including irrigation, tractors, and even coffee harvesters. In other regions, especially Central America, Africa, and Asia, coffee is produced by smallholders. In some Africa countries, smallholders own as little as one-quarter of a hectare of land. In this setting, the key input is labor and, to a limited extent, chemicals. In some East African countries there are also coffee estates that use large numbers of permanent workers.

More than 80 percent of coffee is traded internationally and consumed mainly by high-income countries. In some years, coffee is the second most-traded commodity after crude oil, generating about $15 billion in export revenue. The United States accounts for about 18 percent of global consumption, followed by Brazil (13%), Germany (9%), Japan (6%), and France and Italy (5% each).

Coffee is traded in green bean form. Although there are numerous coffee trading companies, most coffee trade is handled by five or six large multinationals. Coffee prices are determined in futures exchanges. Highly-liquid coffee futures contracts are traded at the New York Board of Trade for arabica and at the London International Financial Futures and Options Exchange for robusta. Less-liquid contracts are traded at the Commodity Exchanges of São Paulo, Singapore, and Bangalore.

Coffee prices are generally highly volatile (much more so than other commodity prices). This volatility reflects the fact that Brazil, the dominant supplier, suffers occasional frosts, thus subjecting its coffee output to considerable fluctuations. Hedge funds also play a role in price volatility, especially in the short term. Beginning in
2000, coffee experienced one of the most dramatic price declines in the history of the industry (an episode referred to as the coffee crisis). In October 2001 arabica averaged $1.24 per kilogram, a nine-year low, while in January 2002 robusta dropped to $0.50 per kilogram (the lowest nominal level since the price of $0.49 per kilogram set in May 1965). The main factor behind the price collapse was oversupply, especially in Brazil, which averaged a record output of thirty-three million bags of coffee during the previous four seasons, and in Vietnam, which emerged as the dominant robusta producer, overtaking Colombia as the world’s second-largest coffee producer. The oversupply, caused by lower-cost producers, led some to argue, convincingly, that the coffee crisis was a market-driven outcome of the coffee industry adjusting to new global market realities (Lindsey 2003).

THE POLICY ENVIRONMENT

The coffee market has been subject to considerable policy interventions both at national and international levels. Takamasa Akiyama (2001) reported that only fifteen of the world’s fifty-one coffee-producing countries had private marketing systems in 1985. Twenty-five countries sold coffee through state-owned enterprises, while another eleven had mixed state- and private-sector marketing bodies. By 2007 the coffee sectors of most countries were operating with private-sector marketing arrangements.

The coffee market has also been subject to a series of coffee agreements administered by the International Coffee Organization (ICO), which was established in 1962 to stabilize coffee prices by dictating how much coffee each producer could export. Research has shown that coffee prices were higher under the ICO than they would have been otherwise (Gilbert 1995). There were likely political reasons behind the ICO’s supply measures. According to Robert Bates (1997), the United States, a powerful ICO member, used the organization during the 1960s and 1970s to increase the income of Central American coffee-producing countries in the hope that this action would contain the spread of communism in the region. Similarly, western European countries viewed ICO-induced high coffee prices as a way to provide aid to their former African colonies.

Most coffee-producing countries (accounting for 90 percent of global output) and almost all developed coffee-consuming countries were members of the ICO (interestingly, communist countries, which were not members of the ICO, bought coffee under free trading arrangements). The last international coffee agreement was effective from September 1980 to July 1989, after which the ICO was abandoned. A more recent attempt to regulate supplies through another organization, the Association of Coffee Producing Countries, failed.

FACTORS INFLUENCING THE INDUSTRY’S LONG-TERM OUTLOOK

In the absence of new international initiatives or domestic policies by dominant producers, the outlook for the coffee market depends entirely on supply-and-demand forces. Vietnam’s emergence as a major robusta producer is likely to influence robusta prices for many years. In 1980 Vietnam produced 140,000 60-kilogram bags of coffee—less than 0.2 percent of world production. In 2001 Vietnam exceeded 13.3 million bags—more than 11.4 percent of world production. Vietnam is a low-cost producer, and as of 2007 its coffee trees were very young and had yet to reach maximum yields. Brazil has been able to maintain unprecedented output levels, averaging more than 39 million bags during 2003–2006. Extensive mechanization of coffee harvesting has lowered production costs, while better varieties with higher yields have been developed and adopted. Shifting production north, away from frost-prone areas in the south, has reduced the likelihood of weather-related supply disruptions. And the extensive use of irrigation has stabilized and sustained yields.

On the demand side, the coffee industry faces growing competition from the soft drink industry. For example, the 1970 annual per capita consumption of soft drinks in the United States was 86 liters; by 1999, annual per capita consumption had exceeded 200 liters, according to U.S. Department of Agriculture data.

Numerous other factors are likely to influence the coffee industry’s long-term outlook. First, new technologies enable roasters to eliminate the harsh taste of some coffees, essentially achieving a higher level of quality from lower-quality beans. Second, roasters have been more flexible in their ability to make short-term switches between coffee types, implying that the premia of certain types of coffee cannot be retained for long. Third, a small segment of the market has emerged that focuses on product differentiation, such as organic, gourmet, and shade coffee. The implication of these developments is that the demand outlook is likely to differ from one coffee producer to another. Specifically, any expansion in coffee demand is likely to occur at the two ends of the spectrum: lower-quality beans (reflecting improved technology) and specialty coffees (reflecting expansion to niche markets).

Several new patterns have emerged in coffee promotion and distribution as well. Coffee promotion used to take the form of national brands, represented by the familiar Juan Valdez campaign of the National Federation of Coffee Growers of Colombia. Other types of promotions were undertaken by coffee-trading companies, such as Maxwell House’s “Good to the Last Drop” campaign.
market and trade setting has shifted considerably since the mid-1980s.

In 2007 as much as 10 percent of coffee is branded according to such characteristics as subnational origin (e.g., Kilimanjaro coffee rather than Tanzanian coffee, or Harare coffee rather than Ethiopian coffee); social aspects (e.g., fair trade coffee, which ensures a minimum price to growers); and organic, shade, or bird-friendly production (which ensures compliance with certain environmental criteria).

A second emerging pattern is the development of direct relationships between major coffee retailers, such as Starbucks, and producer organizations that can ensure that the coffee these retailers sell adheres to certain social criteria. Initially, it was believed that, in addition to offering more choices to consumers, these new marketing and branding mechanisms would provide a boost to the income of small coffee growers. While this was the case initially, research has shown that the premia received by coffee growers have declined and are likely to shrink even more as increasing numbers of producers join the specialty coffee marketing channels (Kilian et al. 2006).

COGNITION

Cognitive psychology is the scientific study of the mental processes that underlie behavior. These mental processes comprise a number of areas, including attention, memory, perception, thinking, reasoning, problem solving, decision making, language, knowledge representation, mental imagery, and motivation and concept formation. This focus on mental processes contrasts with behaviorism, which studied only behaviors that could be directly observed. Cognitive psychology is flourishing at the beginning of the twenty-first century, and its principles have been applied to clinical and counseling psychology, personality theory, developmental psychology, social psychology, comparative psychology, forensics and legal psychology, and education, among other disciplines. Other independent schools of thought have developed from cognitive psychology, including cognitive science and cognitive neuroscience.

HISTORY

Some historians have argued that cognitive psychology represents a shift in the psychological paradigm away from the limits of behaviorism (Gardner 1985; Sperry 1993). Others suggest that cognitive psychology simply represents a return to the same topics that existed prior to the founding of behaviorism (Hergenhahn 1994, p. 555). Extensive evidence indicates that cognitive psychology does not represent the study of a novel topic but a return to a focus on mental events that behaviorism failed to allow. Throughout the history of psychology, some form of cognitive psychology always existed (Hergenhahn 1997, p. 551). The questions raised by cognitive psychologists also occupied early thinkers. The ancient Greek philosopher Aristotle (384–322 BCE), for example, wrote on various topics in cognitive psychology. However, during the 1930s to 1950s, when radical behaviorism was experiencing its strongest period, it was generally accepted that cognitive events either did not exist or should be ignored by psychologists because they could not be studied objectively (Hergenhahn 1997, p. 551). However, as psychologists became less captivated by behaviorism, they began to shift toward a cognitive approach that was broader in scope than behaviorism.

The Downfall of Behaviorism Several findings led to the downfall of behaviorism and the eventual rise of cognitive psychology. According to strict behaviorism, two things must occur if an organism is to learn: (1) the organism must actually perform the behavior, and (2) the behavior must lead to some type of a consequence (i.e., reinforcement or punishment). The continuation of behaviorism’s control of psychology rested on these basic premises. However, three major findings showed these premises to
Cognitive Maps and Latent Learning The American psychologist Edward Chace Tolman (1886–1959) is best known for his research on cognitive maps and latent learning. His work with cognitive maps showed that an organism could possess a mental representation of a physical space that would allow the organism to follow alternate routes to a food reward even if the organism was never reinforced for that route in the past (Tolman et al. 1946). Tolman’s work with latent learning showed that rats were able to learn their way through a maze even if they never received reinforcement while they explored the maze (Tolman and Honzik 1930). In Tolman’s study, the number of errors made by rats that were regularly rewarded gradually decreased as they learned their way through a maze. Other rats in a no-reward condition received no reinforcement for the first ten days of training but were simply placed in the maze for the same amount of time as the regularly rewarded rats. On the eleventh day, these rats were given a food reward. Much to the behaviorists’ surprise, these rats made the same number of errors as the regularly rewarded rats on the twelfth day of training, rather than showing the gradual learning curve predicted by behaviorists. This research showed that the rats learned the maze, even without reinforcement.

Observational Learning and Modeling Psychologist Albert Bandura is probably best known for his work demonstrating observational learning. Bandura showed that organisms can learn by watching another organism receive reinforcement or punishment (Bandura et al. 1966). Thus, it is not necessary that the learner actually perform the behavior, nor must the learner receive reinforcement or punishment in order to learn.

Each of these findings failed to validate the most basic behaviorist premises. Additionally, many psychologists began to become less enchanted with behaviorism because of the limitations concerning what could be studied. For example, behaviorists felt that psychology should study only topics or phenomena that could be studied objectively and directly observed. Although cognitive psychology retained the practice of studying topics in an objective, scientific manner, the inclusion of only those topics that were based on direct observation was eliminated. While many research topics of interest to psychologists (thinking, perception, attention, motivation, emotion, decision processes, problem solving, language, etc.) stood outside the realm of psychological study under behaviorism, many of these topics became central to the cognitive psychology movement and are still studied today.

The Rise of Cognitive Psychology Richard Robins, Samuel Gosling, and Kenneth Craik (1999) have presented an analysis of the gradual decline in the behaviorist approach and the eventual rise of cognitive psychology. Cognitive psychology became more and more influential as it overtook the behaviorist approach by 1970 based on the number of articles published in the most prominent psychology journals. There were, however, several important earlier publications and studies that led to the resurgence of cognitive psychology.

The German psychologist Hermann Ebbinghaus (1850–1909) demonstrated in 1885 that complex mental processes, such as memory, could be studied using an objective, experimental approach. He studied nonsense syllables (or letter strings that did not make up words, such as YHB) and recorded the number of trials it took to learn the list to perfection. He then measured the savings score (i.e., how much time was saved as one learned the list to perfection again) as a measure of memory.

The Principles of Psychology (1890) by William James (1842–1910) cited numerous studies investigating cognitive phenomena and discussed many topics that currently interest cognitive psychologists, such as attention, perception, memory, and reasoning. James also argued that the human mind does not simply react to stimuli in the environment (a common behaviorist idea) but instead is dynamic and interactive.

Remembering: A Study in Experimental and Social Psychology (1932), by British psychologist Frederic Charles Bartlett (1886–1969), showed that memory was predictable and subject to systematic errors. In particular, Bartlett noted that memory errors were influenced by the rememberer’s attitudes, beliefs, schemas, and preconceptions. He proposed that memory is a constructive process such that our own interpretations and biases have a huge impact on what we remember, rather than remembering strictly verbatim information.

American psychologist George A. Miller is probably the one scientist who has had the largest impact in the formation of cognitive psychology as a formal school of thought. In fact, many historians have suggested that his article “The Magical Number Seven, Plus or Minus Two: Some Limits on our Capacity for Processing Information” (1956) was the official beginning of cognitive psychology. This article essentially defined the capacity limits of short-term memory.

Several additional events were also critical for the development of cognitive psychology as a formal school of thought. World War II (1939–1945) led to the development of cognitive psychology and human factors engineering (Proctor and Van Zandt 1994, p. 5). As more complex instruments were developed, the U.S. military became increasingly interested in how humans interacted...
with such instruments. These questions involved such topics as attention, memory, perception, and decision making. On September 11, 1956, many important researchers attended a symposium at the Massachusetts Institute of Technology and became excited about the direction of this new approach (Matlin 2005, p. 7). So important was this symposium that some historians have argued that this date marks the official beginning of cognitive psychology.

German-born psychologist Ulric Neisser coined the term cognitive psychology with the publication of his book Cognitive Psychology in 1967. The journal Cognitive Psychology was founded in 1969, providing an outlet for researchers specifically interested in cognitive topics. Fifteen additional journals focusing on cognitive psychology were established during the next twenty years, indicating a rise in interest in cognitive topics and the rise of cognitive psychology.

AREAS OF INTEREST IN COGNITIVE PSYCHOLOGY

Attention. This area of research looks at an array of topics that focus on our ability to pay attention to specific stimuli while excluding other stimuli (selective attention) or to pay attention to two stimuli at the same time (divided attention). Topics include pattern recognition, object recognition, selective attention, divided attention, and subliminal perception.

Perception. Perception is the use of previous knowledge to gather and interpret stimuli registered by the senses (Matlin 2005). This process actively organizes and interprets sensory information in order to make it meaningful. Perception is usually discussed in conjunction with sensory processes with simple stimuli, but it is also studied in terms of how it functions in more complex social situations. For example, if someone bumped into you while walking down the street, your perception of the incident might be dependent upon both the characteristics of the other individual. You might interpret it as an accident if an elderly woman bumped into you, but your interpretation might be different if the other person was a member of a group of boisterous teenagers.

Memory. This broad area of research focuses on the encoding, storage, and retrieval processes involved when one remembers information at a later time. Experts generally agree that memories are a result of not only the specific event that is being remembered but also the specific thoughts, emotions, and knowledge that the rememberer possesses. Furthermore, events or thoughts that occur after the encoded event also have an impact on what is remembered.

Language. This area of research focuses on how humans (and nonhumans) acquire and use language. There is also a major focus on the specific language rules (or grammar) that accompany language processing.

Thinking. This broad area of research includes various topics such as problem solving, decision making, mental imagery, and logic. The general focus is on the internal thought processes. Such thought processes may occur prior to overt behavior or during overt behavior, or they may occur as a result of external stimuli. Cognitive neuroscience may use brain-imaging techniques to provide objective measurements of when thinking occurs and which part of the brain is active during specific tasks.

Knowledge Representation. This area of research investigates how information is stored and accessed by the brain. Much of the research in this area focuses on mental models that explain how knowledge is stored in the brain. The two main codes that have been proposed for knowledge representation are based upon analog or propositional codes. Other major areas of research include categorization and how people utilize schemas and scripts in everyday life.

Artificial Intelligence. The information-processing approach to cognitive psychology uses the computer as a model for the human mind. This branch of cognitive psychology led to connectionist frameworks and the parallel distributed processing approach to studying cognition. The analogy that is the basis for the study of artificial intelligence is that computer connections between stored knowledge or idea units are similar to the physical, neural networks present in the brain (McClelland and Rumelhart 1985).

OTHER DISCIPLINES THAT EVOLVED FROM COGNITIVE PSYCHOLOGY

Cognitive Neuroscience. This area combines the basic research techniques and issues from cognitive psychology with various methods (e.g., brain scanning, event-related potential, and single-cell recording) to evaluate the physiological functioning of the brain. Cognitive neuroscience has helped scientists better understand how the brain works and what each part of the brain does, and it provides insight into brain abnormalities or damage.

Cognitive Science. Cognitive science is a multidisciplinary field that studies the workings of the mind by combining the approaches of cognitive psychology, neuroscience, and computer science. It may include other fields, such as philosophy, sociology, linguistics, and anthropol-
ogy (Sobel 2001). Cognitive science takes a more holistic approach, since it utilizes techniques and theories from many different fields of study.

COGNITIVE DISSONANCE

Cognitive dissonance is a social psychological theory introduced by Leon Festinger (1957), describing the way in which people cope with and rationalize inconsistencies in their experience, such as holding incompatible beliefs, acting in ways that violate their values, being forced to choose one of two equally attractive alternatives, or discovering that their efforts were not worth the result obtained. The term refers both to a lack of harmony among one’s thoughts and to the discomfort that results from this, which individuals are motivated to reduce by changing their mind or their behavior in the service of greater cognitive consonance. From its initial focus on discordant thoughts, the theory has evolved over the years to stress that the ultimate motivation for reducing dissonance is to preserve the belief that one is a good and rational person, and the theory is now primarily used to understand processes by which individuals justify past behavior to themselves. The concept has also been fruitfully borrowed by other social sciences: Sociologists, for example, use the theory to study the experience of individuals with conflicting identities, to analyze the maintenance of myths, and to explore aspects of religious life. Economists have used it to understand investment decisions, happiness with allocation decisions, or satisfaction with welfare policies.

EXPERIMENTAL DEMONSTRATIONS OF THE POWER OF DISSONANCE

In the first experimental demonstration of how people reduce dissonance, Festinger showed that when students
agreed to lie to a peer for a token reward of one dollar (by saying that a boring task was in fact interesting), they came to like the task more than if they were compensated with twenty dollars. The discomfort of having lied with no obvious justification was alleviated by deciding that it was not such a lie after all. Unable to change the memory of their past behavior, they addressed the dissonance by altering the other incompatible cognition, and pronounced the task more interesting. This finding was inconsistent with learning theories prevalent at the time, which predicted that organisms would prefer those behaviors for which they are rewarded most. It was also a striking demonstration of how, contrary to the common perception that attitudes always govern behavior, behavior can also influence attitudes.

Later dissonance research relied heavily on two experimental procedures capturing the discomfort that lingers after difficult decisions. Most inspired by the original Festinger demonstration, the induced compliance paradigm requires that participants write an essay on a topic that they care about, but in support of a position opposite to their own. When the experimenter emphasizes that participants are free to refuse to write the essay, they still write it, but eventually change their stance from their original position toward the position in the essay. No such change happens when participants are simply instructed to write the essay with no room for choice. As before, the discomfort caused by misrepresenting their attitude without sufficient justification led high-choice participants to bring their attitudes more in line with their actions.

A second widely used procedure, the forced choice paradigm, introduced by Jack Brehm (1956), illustrates how people cope after they have had to pick one of two options when they had no clear-cut initial preference. After making such a choice (in Brehm's study, housewives had to pick one of two moderately but equally attractive household appliances to take home as a gift), a typical reaction is to immediately start liking the chosen option more, and the rejected option less. This spread of alternatives prevents postdecisional regret and increases comfort with one's decision. Difficult choices in everyday life are followed by similar mental work aimed at reducing dissonance by bringing to mind thoughts that support one's choice, such as benefits of the chosen option or flaws of the rejected one.

A noteworthy feature of the theory is its proposal that a “cold” incompatibility between pieces of information in the mind would lead to a “hot” motivational state, a discomfort that individuals would feel a strong urge to reduce. What does this discomfort feel like? In the induced compliance paradigm, individuals report psychological discomfort just after agreeing to write the essay, but less so after they have been given a chance to express their revised attitude. Stress measures such as skin conductance have also been used to show that individuals experiencing dissonance are more physiologically aroused. Dissonance researchers have also relied on misattribution instructions to show the role of discomfort more indirectly: When participants in an induced compliance paradigm were told that a pill they just took might make them feel tense, the discomfort arising from writing the essay was ascribed (misattributed) to the pill, and participants changed their attitude less than when the pill was revealed to be just a placebo. This again demonstrates that attitude change results from discomfort with the inconsistent cognitions, because cognitions are left alone when discomfort is attributed elsewhere.

Besides these powerful experimental demonstrations, social psychologists have also used the theory to understand, for example, why new members disappointed by a group still appreciate it more if they went through harsh initiation practices to get admitted (effort justification), how individuals come to terms with doing things that they know are bad for them (e.g., smoking), or how, more encouraging, people who are reminded that their habits do not fit their values sometimes start practicing what they preach. And while the bulk of the research has focused on attribute change as the means to reduce dissonance, psychologists have shown that discomfort can also be reduced by trivializing the inconsistency, denying responsibility for the problematic behavior, looking for social support for a disconfirmed belief, or by taking substances such as alcohol that directly alter one's psychological state.

CONTROVERSIES AND ALTERNATIVE MODELS

Cognitive dissonance is the theory that has inspired the most debate and reinterpretation in social psychology. One early attempt at reappraisal was Daryl Bem’s self-perception theory (1972), which argued that what looks like attitude change does not result from inconsistent cognitions, but rather from the fact that individuals first learn about their own preferences and attitudes by observing their own behavior. As they would if observing others, individuals who saw themselves agree to write an essay for little reward inferred that they must be sympathetic with the position defended—and discomfort need not be involved. Similarly, individuals choosing one option over another in the forced-choice paradigm inferred that they must like the chosen option more. After much debate, psychologists now believe that self-perception explains the effects observed in unimportant domains, where people do not hold strong preformed attitudes, but that in important domains where individuals have strong attitudes, dissonance (and its accompanying discomfort) is a
better account of the evidence available. In fact, later theorists have framed dissonance more in terms of threats to the self than in terms of purely cognitive inconsistency. They argued that inconsistency is only aversive if it threatens the actor’s sense of integrity (Aronson 1969), or that the behaviors elicited in dissonance paradigms violate the actor’s self-standards. Claude Steele (1988) suggested that they threaten the actor’s sense of moral and adaptive adequacy, and predicted that asserting any valued aspect of the actor’s self would suffice to alleviate dissonance without need for attitude change, even if this self-affirmation was unrelated to the inconsistency at hand. Indeed, he showed that individuals for whom art was very important did not exhibit as much dissonance in an unrelated induced compliance paradigm if they had a chance to express and reflect on their artistic interests beforehand. Finally, cross-cultural comparisons suggest that dissonance might be uniquely aversive to individuals from cultures emphasizing an independent self and analytic forms of thinking (e.g., Americans), based on the finding that classic dissonance inductions are much less effective with individuals from cultures that emphasize an interdependent self and holistic forms of reasoning with greater tolerance for inconsistency (e.g., Japanese).

COHABITATION
Cohabitation is defined as a situation in which opposite-sex couples live together outside of marriage. Much of the literature on cohabitation is derived from research findings by sociologists and psychologists, which places this literature in a central position within the social sciences. This entry provides a brief discussion of who cohabits, why people choose to cohabit, and the consequences of cohabitation for couples, children, and society.

Cohabitation has become increasingly popular since the 1960s, with the majority of young adults in the United States experiencing cohabitation. For most couples, this is a relatively short-term experience, with only one-third of American couples cohabiting for at least two years and only 10 percent doing so for at least five years. About 60 percent of these unions eventually result in marriage. In 2007 nearly five million opposite-sex couples in the United States were living together outside of marriage, largely without legal protections, which is particularly problematic for female cohabitants. This compares to 500,000 cohabiting couples in 1970.

This growing popularity of cohabitation has resulted in a concern among some observers that the practice presents a challenge to marriage as a method of coupling. They argue that marriage is being redefined as one of several choices. The literature suggests that for older cohabitants and for African American couples this lifestyle choice does represent an alternative to marriage. For most Americans, however, marriage remains the primary choice for coupling. Cohabitation is increasingly viewed as a transitional stage between single life and marriage, rather than as an alternative to marriage. Unlike in the United States, however, cohabitation is a significant alternative to marriage for young Scandinavian couples. In addition, increasing economic inequality in the United States is decreasing the opportunities for marriage among less-affluent Americans.

The most commonly cited reasons for moving in together are romance, convenience, the need for housing, and the chance to save money. How well do cohabitants get along with each other? Recent research has found that cohabiting couples are significantly less satisfied in their unions than those who are legally married. This is due, in part, to the fact that cohabiting couples often have more precarious economic circumstances than do married couples. In addition, the presence of children, which reduces satisfaction levels for both married and cohabiting couples, has a more profound effect on nonmarital unions. This is significant in that children are present for 40 percent of cohabiting couples. Further, it is widely assumed that the outcomes are worse for children raised by cohab-
Cohort Effects

Sitting couples, as opposed to children raised by married parents.

Lastly, does living with one’s partner prior to marriage increase the likelihood of success after marriage? Couples who move in together before marriage have up to two times the odds of divorce compared to those couples who do not live together prior to marriage (Blackwell and Lichter 2000). Some argue that living together creates social pressure to get married, which can contribute to poor mate selection.

COINTEGRATION

Time-series data consist of multiple observations of firms, households, persons, or other entities over several time periods. Many economic time series have empirical distributions that are nonconstant over time, with changing means and variances, making these series nonstationary. Stochastic trends occur when there are persistent long-term movements in time series data; and such trends represent a major source of nonstationarity, causing variables to drift over time. Series with stochastic trends are thus called “integrated” or “unit-root” processes.

In 1982, Charles Nelson and Charles Plosser showed that, empirically, many macroeconomic time series appear to be integrated of order one [denoted I(1)]. Growth rates of these series do not tend to drift, which is consistent with the growth rates being nonintegrated, i.e., integrated of order zero [denoted I(0)]. Moreover, efficient-market theories in economics and finance suggest that asset and commodity prices follow a random walk, which is the simplest I(1) process.

Cointegration occurs when a relationship ties together nonstationary economic time series such that a combination of those time series is I(0). The concepts of integration and cointegration are intrinsically statistical in nature. Cointegration formalizes, in statistical terms, the property of a long-run relation between integrated economic variables.

SOME ECONOMIC IMPLICATIONS OF COINTEGRATION

While cointegration is a statistical concept, it has economic implications. For example, it plays important roles in five aspects of economics: (1) long-run relations, (2) agent optimization, (3) the problem of nonsense regressions, (4) equilibrium correction (or error correction) models (ECMs), and (5) economic forecasting.

First, cointegration embeds the economic notion of a long-run relationship between economic variables in a statistical model of those variables. If a long-run relation exists, then the variables are cointegrated.

Second, market forces or optimizing behavior often provide an economic rationale for cointegration. For instance, consumers’ expenditure and income may be cointegrated because of economic agents’ budget constraints or because of intertemporal optimization plans for lifetime saving.

Third, the statistical theory of unit-root processes aids inference about the empirical existence of cointegration. Econometric theory historically relied on the assumption of stationary data even though many observed economic time series were trending and nonstationary. Cointegration explicitly allows for nonstationarity, thus providing a sounder basis for empirical inference. Cointegration also clarifies the problem of nonsense regressions, in which intrinsically unrelated nonstationary time series are highly correlated with each other.

Fourth, cointegration implies, and is implied by, the existence of an equilibrium correction representation of the relevant variables. Cointegration thus solidifies the statistical and economic bases for the empirically successful class of equilibrium correction models, in which past disequilibria in levels have an effect on current changes in the variables. Through ECMs, cointegration provides a systematic framework for jointly analyzing short-run (e.g., cyclical) and long-run properties. This framework also resolves the debate on whether to model data in levels or
in differences, with classical econometric models and George Box and Gwilym Jenkins's time-series models both being special cases of ECMs.

Fifth, optimal forecasts of cointegrated variables are themselves cointegrated. Hence, the existence of cointegration may improve the long-term forecasting of economic time series.

HISTORY
The history of cointegration was examined by David Hendry in “The Nobel Memorial Prize for Clive W. J. Granger” (2004). Hendry and Mary Morgan, in The Foundations of Econometric Analysis (1995), highlight the following events in that history. In 1901, R. H. Hooker illustrated and analyzed the difficulties attendant to nonstationarity, which he viewed as “common trends.” In 1926, G. Udny Yule showed that I(1) and I(2) observations would generate “nonsense correlations”; for example, high correlations lacking causal explanation, such as between church marriages and mortality rates. In 1974, Clive Granger and Paul Newbold reemphasized the dangers of nonsense correlations, and Peter Phillips presented a formal analysis in 1986, which he updated in 1998. Klein’s great ratios of economics (e.g., of consumption to income) suggested that variables’ levels can be closely related. J. Denis Sargan established the link between static-equilibrium economic theory and ECMs in 1964. In the 1980s, Granger and Robert Engle developed cointegration analysis as such.

MODEL SPECIFICATION
In 1987, Engle and Granger established an isomorphism between cointegration and ECMs. Cointegration entails, and is entailed by, an ECM, which explicitly embeds a steady-state solution for its variables, while also allowing them to deviate from that steady state in the short run. In a nonstochastic steady state, an equilibrium relation would typically be motivated by economic theory. Hence, economic hypotheses are testable in a cointegration framework. In empirical work, conditional ECMs have been popular and may be interpretable as agents’ contingent plans. Applications include wages and prices, consumers’ expenditure, and money demand.

TESTING FOR INTEGRATION AND COINTEGRATION
Cointegration makes the economic concept of equilibrium operational; that is, data allow tests of whether a long-run relation holds. With suitable tests, asymptotically correct inferences can be obtained. In addition, spurious regressions can be detected and avoided, as can unbalanced regressions involving variables of different orders of integration.

Economic theory rarely specifies orders of integration for variables, so a practitioner must analyze the data for both integration and cointegration. While the presence of unit roots complicates inference because some associated limiting distributions are nonstandard, critical values have been tabulated for many common cases. David Dickey and Wayne Fuller calculated critical values of tests for unit roots in univariate processes, and many robust unit-root tests have subsequently been developed.

Numerous cointegration tests have also been designed. In 1987, Engle and Granger proposed a single-equation approach that is intuitive and easy to implement, though it includes nuisance parameters in inference and may lack power (see Hendry 1986). A test of cointegration is also feasible in the corresponding ECM (see Neil Ericsson and James MacKinnon 2002).

Søren Johansen has provided a system-based approach in which cointegration relations are estimated via maximum likelihood in a vector autoregression (VAR). Johansen’s test statistics for cointegration generalize the Dickey-Fuller statistic to the multivariate context. Several authors have tabulated critical values, which are also embodied in software such as Cats for Rats and PcGive. In Johansen’s framework, hypotheses about cointegration properties are also testable. For instance, testing the long-run homogeneity of money with respect to prices is equivalent to testing whether the logs of money and prices are cointegrated with a unit coefficient. Other hypotheses, such as weak exogeneity, can be tested in Johansen’s framework as well. Weak exogeneity is satisfied if the cointegrating vector entering the conditional model does not appear in the marginal model of the conditioning variables. Under weak exogeneity, inference on those parameters from the conditional model alone is without loss of information relative to inference in the complete system.

In summary, cointegration and equilibrium correction help us understand short-run and long-run properties of economic data, and they provide a framework for testing economic hypotheses about growth and fluctuations. At the outset of an empirical investigation, economic time series should be analyzed for integration and cointegration, and tests are readily available to do so. Such analyses can aid in the interpretation of subsequent results and may suggest possible modeling strategies and specifications that are consistent with the data, while also reducing the risk of spurious regressions.

COLD WAR

The term cold war generally refers to the post–World War II global geostrategic, economic, and ideological competition between the East, led by the Soviet Union, and the West, led by the United States. Although there is no real agreement on the beginning of the cold war, its onset is often associated with the Yalta Conference in February 1945, when the United States, the United Kingdom, and the Soviet Union (led by Franklin D. Roosevelt, Winston Churchill, and Joseph Stalin, respectively) met to discuss the war in the Pacific and the postwar division of Germany. The term itself denotes the absence of direct armed conflict, but this period was characterized by mutual perceptions of hostile intentions between the U.S. and Soviet military-political alliances. The competition between East and West, which lasted from 1947 until 1991, vacillated between confrontation and cooperation. Stalin’s refusal to honor an agreement to support democratic elections in Eastern Europe ultimately became a critical factor in East-West relations (see Schlesinger 1971). The end of World War II ushered in a bipolar, global balance of power, which rendered the once dominant powers of Europe militarily, economically, and psychologically dependent of the United States. This was due, in part, to the perceived menacing presence of the Soviet Union. The policy of containment, then, became the cornerstone of U.S. national security during the cold war years.

The dissolution of the European colonial empires provided the arena in which the two superpowers played upon each other’s fears and competed for influence.
Competing across an ideological divide symbolized by the “Iron Curtain,” they sought allies, trading partners, military bases, strategic minerals, and investment opportunities in Asian, African, Middle Eastern, and Latin American countries. Diplomatic maneuvering, economic pressure, selective aid, intimidation, propaganda, assassinations, low-intensity military operations, and full-scale proxy wars were used as instruments of influence and control from about 1947 until the decline of the Warsaw Pact (the Communist bloc of nations, led by the Soviet Union) in the late 1980s.

There are also variations in the intensity of the cold war relations that can be tied to changes in U.S. and Soviet political leadership. A slight weakening of hostilities following Stalin’s death in 1953 was followed by escalating tensions following the Soviet launch of the Sputnik satellite in 1957, the erection of the Berlin Wall and the failed U.S. Bay of Pigs Invasion in 1961, and the Cuban Missile Crisis of 1962. Tension eased a bit with signing of the Nuclear Test-Ban Treaty in 1963, but Leonid Brezhnev’s consolidation of power in the Soviet Union contributed to growing hostilities, which waned again in the 1970s during the era of détente and the Strategic Arms Limitation Talks (SALT I) Agreement.

The cold war also witnessed the largest arms race in history, leading to widespread global fears of a potential nuclear war (see Clausen 1993). The nuclear arms race, which began after the Korean War, was influenced by the actions and perceptions of both U.S. president John F. Kennedy and Soviet premier Nikita Khrushchev. Although the arms race made the policy of deterrence credible, it was very costly for both sides. In fact, the theory of mutual assured destruction (MAD) led to the militarization of both the United States and Soviet Union. Mikhail Gorbachev’s ascension to power in the 1980s, however, paved the way for future reductions in nuclear weapons and improved U.S.-Soviet relations.

COLLECTIVE ACTION

The logic of collective action (Olson 1965), which has proved to be applicable to a broad range of social and economic situations, assumes that cooperation must be explained by the individual’s cost-benefit calculus rather than that of the group because the group as a whole is not rational but can only consist of rational individuals. Groups often seek public goods that are available, once they have been generated, to everyone, including those who did not contribute to producing them. Because individuals potentially can receive the benefits of public goods without having contributed to their production, they have an incentive to let others pay for them.

In classic examples of collective action problems, such as preserving the environment, sharing a natural resource, participating in national defense, voting in mass elections, and engaging in social protests, group members gain when all individuals do their share, but for any individual the marginal benefit of contributing exceeds the cost. If each individual follows his or her self-interest, the outcome—total defection—is worse for everyone than if all had cooperated in supplying the public good. Studies of collective action using game theory, laboratory experiments, and historical cases have been used to identify the conditions under which rational actors are likely to cooperate when they have a strong incentive to be free riders.

Many groups alter cost-benefit calculations by offering selective incentives in the form of material rewards to cooperators and punishments to free riders. Shame, praise, honor, and ostracism can be viewed in this regard as nonmaterial social selective incentives. The administra-
tion of a system of selective incentives by a central authority or by group members, however, usually entails a separate collective action problem that requires further explanation because individuals have an incentive not to contribute to the maintenance of such a system.

Another potential selective incentive is the psychological or expressive benefit inherent in the activity. In this case the motivation for cooperation is not the outcome sought through collective action but the process or experience of participation. For some people, political and organizational activity builds self-esteem and feelings of political efficacy, symbolizes political citizenship, reinforces moral convictions, and constitutes an enthralling experience.

Aside from changing individual incentives, cooperation in groups can be fostered by repeated social interactions that introduce long-term calculations. In iterated social interaction, a person can try to influence the behavior of others by making his or her choices contingent on their earlier choices. Cooperation is therefore possible among self-interested individuals if they care sufficiently about future payoffs to modify their current behavior.

Conditional cooperation is less likely to solve the collective action problem as group size increases because defection is harder to identify and deter when many people are involved. Intuitively the members of small groups are likely to have closer personal bonds, individual contributions will have a greater impact on the likelihood of collective success, and individual defections can be observed more readily. For this reason contingent cooperation in large-scale ventures is facilitated when collective action entails a federated network of community groups and organizations.

There is no reason to suppose that successful collective action can be driven by a single motivation, either coercive or voluntary. Self-interested calculations that are based on selective material incentives and ongoing social exchange often have to be supplemented by moral and psychological considerations and coordinated by political leadership to motivate people to contribute to collective goods. Also it is not necessary to assume that all contributors to collective action will employ the same cost-benefit calculus. Collective action frequently relies on the initiative and sacrifice of committed leaders who supply information, resources, and monitoring and lay the foundation for subsequent conditional cooperation among more narrowly self-interested actors.

COLLECTIVE ACTION GAMES
A collective action problem arises when two or more individuals have the potential to jointly coordinate on some mutually beneficial action, but do not face the right incentives to act in this manner. Such situations are ubiquitous in economic and social life, and arise in the context of political mobilization, electoral turnout, pollution abatement, common property resource use, and the private provision of public goods such as irrigation systems, parks, and national defense.

Collective action problems are often modeled using the theory of games. A simple example is the public goods game, which has the following structure. Consider a group of $n$ individuals, each of whom can either “contribute” or “not contribute” to the provision of a “public good.” The private cost of contributing is $c$. Each individual’s contribution results in a benefit $b$ to each member of the group, including those who do not contribute. The aggregate benefits resulting from a contribution are therefore equal to $nb$. If $b < c < nb$, then the benefit to the group of a contribution exceeds the cost, but the benefits that accrue to the contributor are less than the cost. In this case, individuals who are unconcerned with the effects of their actions on others will fail to contribute, and if the entire group is composed of such individuals, no contributions will be observed. This is a worse outcome from the perspective of each individual than would arise if all were forced to contribute. Each member of the group can therefore benefit if, instead of being allowed to freely make their own choices, they were all subject to “mutual coercion, mutually agreed upon” (Hardin 1968, p. 1247).

When some individuals behave in a manner that is beneficial to the group while others choose in accordance with their private interests alone, the latter are sometimes referred to as free riders. There are several ways in which collective action problems may be mitigated through the
punishment of free-riding behavior. If the group is sufficiently small and stable, and interactions among its members are repeated over a long horizon, actions that benefit the group can be sustained by the fear that an individual deviation will trigger deviations by others, resulting in the complete collapse of prosocial behavior. Alternatively, even if interactions are not repeated, collective action can be sustained if individuals have the ability and the inclination to impose direct punishments on each other for free riding. Experimental evidence suggests that many individuals do indeed have such preferences for “altruistic punishment,” and that such propensities have played a key role historically in the sustainable management of common property resources.

The most common solution to collective action problems is through the intervention of a centralized authority that can set rules for behavior and impose sanctions on those who fail to comply. Sometimes these sanctions take the form of monetary fines, as in the case of tax evasion or the failure to meet pollution standards. In many instances, however, punishments can take the form of ostracism or expulsion, as in the case of clubs, trade unions, or political parties.

COLLECTIVE MEMORY

Contemporary usage of the term collective memory is largely traceable to Émile Durkheim (1858–1917), who wrote extensively in *The Elementary Forms of the Religious Life* (1912) about commemorative rituals, and to his student, Maurice Halbwachs (1877–1945), who published a landmark study on *The Social Frameworks of Memory* in 1925. For Halbwachs, who accepted Durkheim’s sociological critique of philosophy, studying memory is not a matter of reflecting on the properties of the subjective mind; rather, memory is a matter of how minds work together in society, how their operations are structured by social arrangements: “It is in society that people normally acquire their memories. It is also in society that they recall, recognize, and localize their memories” (Halbwachs 1992, p. 38). Halbwachs thus argued that it is impossible for individuals to remember in any coherent and persistent fashion outside of their group contexts. Group memberships provide the materials for memory and prod the individual into recalling particular events and into forgetting others. Groups can even produce memories in individuals of events that they never experienced in any direct sense. Halbwachs thus resisted the more extreme intuitionist subjectivism of philosopher Henri Bergson (1859–1941) (whose work had nevertheless led Halbwachs to his interest in memory), as well as the commonsense view of remembering as a purely—perhaps even quintessentially—individual affair.

In contrast to Halbwachs’s discussion in *The Social Frameworks of Memory*, however—in which he argues that what individuals remember is determined by their group memberships but still takes place in their own minds—in *The Legendary Topography of the Holy Land* (1941) and elsewhere Halbwachs focused on publicly available commemorative symbols, rituals, and representations. This more Durkheimian discussion in turn undergirded Halbwachs’s contrast between “history” and “collective memory” not as one between public and private but as one based on the relevance of the past to the present: Both history and collective memory are publicly available social facts—the former “dead,” the latter “living.” Halbwachs alternately referred to autobiographical memory, historical memory, history, and collective memory. Autobiographical memory is memory of those events that we ourselves experience (though those experiences are shaped by group memberships), while historical memory is memory that reaches us only through historical records. History is the remembered past to which we no longer have an “organic” relation—the past that is no longer an important part of our lives—while collective memory is the active past that forms our identities.

While rightly credited with establishing “collective memory” both as a concept and as a subject for sociolog-
collective research, Halbwachs is far from the only scholar to have thought systematically about the (changing) relationship between the past and the present. Before Halbwachs, the German philosopher G. W. F. Hegel (1770–1831) had distinguished among original history (eyewitnessing and chronicling), reflective history (scientifc), and philosophical history (teleological). Friedrich Nietzsche (1844–1900) in turn distinguished among antiquarian, monumental, and critical uses of the past.

In contemporary scholarship, the so-called history of mentalities has pursued a “collective psychology” approach to cultural history, seeing images of the past as part of “the whole complex of ideas, aspirations, and feelings which links together the members of a social group” (Goldmann 1964, p. 17), and thus forms an important topic for historical investigation. In Germany, many historians and social scientists have revived an older, philosophical concept of “historical consciousness” (Geschichtsbewusstsein) to guide analysis, linking it to concerns about “the politics of history” (Geschichtspolitik), which indicates both the role of history in politics and the role of politics in history. Yet another camp has employed the awkward yet insightful term memohistory, which “unlike history proper … is concerned not with the past as such, but only with the past as it is remembered” (Assmann 1997, p. 9). Memohistory thus calls for a theory of cultural transmission that helps us understand history not simply as one thing after another nor as a series of objective stages, but as an active process of meaning-making through time, “the ongoing work of reconstructive imagination” (Assmann 1997, p. 9). Yet another similar argument comes out of the hermeneutic tradition, particularly as articulated by German philosopher Hans-Georg Gadamer (1900–2002), in which the meaning of life can be found in our ongoing making and remaking of self-consciousness through interpretation without end.

No matter what the specific conceptualization, what may be called social memory studies (Olick and Robbins 1998) has become a prominent feature of scholarly discourse in recent decades, when Western societies in particular have been experiencing a sort of “memory boom” (Winter 2006). Indeed, explaining this boom has been an important topic for social memory studies. Scholars have variously sought to explain the rise of interest in the past, memory, commemoration, nostalgia, and history in contexts ranging from consumer promotions, popular culture, interior and exterior design, and public space, as well as the rise of reparations, apologies, and other forms of redress in domestic and international politics. Answers have included the decline of the nation-state as a carrier of identity, the end of faith in progress, the rise of multiculturalism, and postmodernity more generally. Most famously, and most generally, the French historian and editor Pierre Nora has claimed that we spend so much time thinking about the past because there is so little of it left: Where we earlier lived lives suffused with pastness—the continuities of habit and custom—we now live disconnected from our pasts, seeing ourselves as radically different than our forebears. In Nora’s terms, where once we were immersed in milieux de mémoire (worlds of memory), we moderns now consciously cultivate lieux de mémoire (places of memory) because memory is now a special topic. In a related manner, the Marxist historian Eric Hobsbawm has distinguished between worlds of custom and worlds of “invented tradition.” Since the late nineteenth century, not only have nation-states sought to shore up declining legitimacy by propagating fictional pasts and a sense of their institutions’ ancientness, people have invented the very category of tradition (as opposed to custom): the idea of self-conscious adherence to past ways of acting (whether genuine or spurious) is itself a product of our distance from the past, which has come to be seen as “a foreign country” (Lowenthal 1985).

Jeffrey K. Olick
COLLECTIVE WISDOM

The term collective wisdom refers to the notion that the totality of knowledge, experience, and skills possessed by the members of a group, whether large or small, typically exceeds that of any individual in the group, and that the members acting in concert are thus capable of judgments, problem-solving, and decision-making that will lead to better outcomes than one could expect of any one of them acting alone. Such a belief, in part, lies at the base of democratically organized groups, as well as larger, more complex social entities. It is also reflected in such popular expressions as, “Two heads are better than one.”

The above presumptions have been objects of skepticism historically, as James Surowiecki (2004) has aptly illustrated in citing the less than charitable views of such notable figures as Henry David Thoreau, Thomas Carlyle, Gustave Le Bon, and Friedrich Nietzsche, all of whom took a dim view of the virtues of collective judgment and action. Surowiecki credits Carlyle, for example, with the observation, “I do not believe in the collective wisdom of individual ignorance” (p. xvi). The derogatory phrase “pooling of ignorance,” which one frequently hears critics ascribe to group decision-making and problem-solving, clearly resonates with Carlyle’s cynicism, as well as that of others.

Underlying the skepticism, unfortunately, is a misrepresentation of the concept. The notion of collective wisdom does not entail the presumption that informed thought, judicious choice, and effective action result in some magical, inexplicable way from the combination of individuals who are not singly capable of these things. Rather, it assumes that the knowledge, experience, and skills of those acting as an entity are often complementary, as well as compensatory. As a result, the entity enlarges its potential for effective judgment, choice, and action. The potential of the group, however, does not exceed the limits of its members. Hence, a group whose members, for instance, lack relevant task-related expertise and ability is not one we would expect to surpass the performance of a single individual who does, let alone a group whose members are all in possession of such expertise and ability. Indeed, evidence supports this presumption (see Beach and Connolly 2005; Shaw 1981).

Collective wisdom was the focus of a good deal of scholarly interest early in the history of social psychology and the concept has continued to attract attention. From the 1920s to well into the 1960s, much attention was paid to questions concerning the relative superiority/inferiority of individuals versus groups in respect to judgment (e.g., Jenness 1932), problem-solving (e.g., Davis and Restle 1963), and learning (e.g., Yuker 1955). Comparative inquiries provided reasonably substantial evidence in support of the presumptions associated with the concept of collective wisdom, as in many cases groups were revealed to make better judgments, show greater effectiveness in problem-solving, and experience larger gains in learning than individuals with whom they were compared. Other later evidence from research on brainstorming further indicated that groups are capable of generating more ideas, as well as a higher proportion of high-quality and novel ideas, than individuals acting alone. Such findings by no means have been unequivocal, however, especially in respect to brainstorming (see Beach and Connolly 2005, Frey 1997; Shaw 1981).

Determining reasons for the discrepancy between the potential collective wisdom affords and the observed performance of groups in particular has been a focus of at least three different areas of scholarly inquiry: diversity of membership, the influence of social variables, and, most recently, collective information-sampling bias. Each offers a different understanding of and insight into the reasons for the inconsistency.

The oldest of the areas of inquiry mentioned is that relating to diversity. Early research had as a focus similarities and differences among the members of groups, initially in respect to abilities and demographic characteristics and later on the basis of personality profiles. On the whole, heterogeneous groups have been found to outperform homogeneous groups (Frey 1997; Shaw 1981). One explanation for why groups do not consistently outperform individuals, then, is suggested by such outcomes. Specifically, groups whose members are too similar to one another have little potential for displaying collective wisdom that exceeds the abilities of any given individual member. Conversely, diversity, while often an asset to a group, can also be a source of disruption that impairs relationships among members and thereby impedes performance (Porter and Samovar 2003).

Social variables can also limit the potential for collective wisdom to operate consistently. This has been demonstrated by Irving Janis’s studies (1972, 1982, 1989) of groupthink, its sources (such as pressure for uniformity, the desire to maintain a harmonious climate, and the undue influence of those in positions of authority), and the heuristics, or mental shortcuts, to which the members of groups often resort when under groupthink’s influence. If the interaction among the members of such groups does not function to overcome the constraints that contribute to the abandonment of rational forms of judgment and choice, one cannot expect to see groups perform more effectively than individuals (Gouran and Hirokawa 1996, 2003). In fact, one would have reason to predict that such bodies might well perform less effectively.

Finally, and most recently, some scholars have begun to focus on an interesting phenomenon in group interaction that has further explanatory value in accounting for
Collectivism

the inconsistently demonstrable superiority of groups as compared to individuals: collective information-processing bias (see Beach and Connolly 2005; Propp 1999; Stasser and Titus 1985). There has been much evidence of a tendency for the members of groups to focus in decision-making and problem-solving discussions on the information they all have in common rather than information they as individuals uniquely possess. Under these circumstances, there is no reason to expect that a group would be more likely to arrive at better decisions and more effective solutions to problems than the most knowledgeable, experienced, and able individual member.

In conclusion, scholarship has established through empirical evidence that collective wisdom is a property of groups. It is not, however, a property that universally enables a group to surpass the performance or exceed the wisdom of its most competent member. How well it functions to assist groups in maximizing their performance depends on the amount they possess, as well as the extent to which other counteracting variables become intrusive.

COLLECTIVISM

Collectivism is a term used to describe various social, political, and economic relations that stress the primacy of the collective, which may be a group of individuals, a society, a state, a nation, race, or social class, over that of the individual. Collectivists subscribe to the belief that the group’s societal or communal “will” takes precedence over that of the individual, who must then sacrifice self-interest for the good of the whole. Thus the group is the fundamental unit of social, political, and economic concern.

From a social perspective, collectivism maintains that humans are interdependent and closely linked to one or more groups. This doctrine views group harmony and solidarity as more important than personal desires and goals. In this case, the group might take the form of a family, race, social class, or religious denomination. Thus, respectfulness, cooperation, and conformity to group norms are expected. Competition and conflict are devalued within the group but viewed as acceptable intergroup behaviors.

Politically, collectivism might be viewed as a doctrine that maintains that the “will” of the people supersedes that of the individual, who must subordinate personal interests
to those of the majority. Thus society as a whole is the standard of moral value. An early example of this kind of collectivism has been associated with Jean-Jacques Rousseau's social contract. In this work, Rousseau posits that human society is organized along the lines of an implicit contract between members of society, with the terms of the contract, such governmental powers, citizens' rights and responsibilities, defined by the "general will." This notion of collectivism is often equated with democracy.

As an economic doctrine, collectivism holds that material resources should be owned by the group and used for the benefit of all rather than being owned by individuals. Although this view of collectivism advocates public over private ownership of property, the state is not necessarily the manager or overseer of collective property, as has been the case with most modern day manifestations of communism. It should also be noted that the principle of collective ownership of property might refer to the means of production or to all commodities that are valued.

While there are many examples of societies characterized as collectivist, few, if any, are entirely collectivist. Moreover, one can find characteristics of collectivism in most societies. Perhaps the best-known practical applications of collectivism are those associated with the agriculture sector of societies. Many of these attempts, however, have resulted in some well-documented failures. For example, the Soviet state's experiment with agricultural collectivization in the 1920s and 1930s was abandoned owing to negative economic consequences. Similarly, Operation Dodoma, which refers to Julius Nyerere's 1974 program of forced collectivization of farming in Tanzania, was largely unsuccessful as a means of increasing benefits perceived to accrue from collective farming. China's 1958 attempt at collectivization of agricultural production, though somewhat more successful than that of the Soviet Union and Tanzania, also failed to yield perceived economic benefits.

COLONIALISM

The matrix of structures, ideologies, and actions that have formed both historical and contemporary patterns of colonialism have shaped the world-system in irreversible and deeply influential ways. Serious consideration of colonialism recognizes that no matter where the starting point for analyzing colonialism is set, the process, structure, and lingering effects of such a geohistorical phenomenon cannot be grasped in a simplistic or one-dimensional way by either academics or those who continue to live colonized lives, for the implications of such naïveté are too severe. Numerous critical scholars—such as Edward Said, Gayatri Spivak, Ania Loomba, Samir Amin, Immanuel Wallerstein, and Wole Soyinka—have devoted their academic careers (which are often rooted in their lived experience within colonial rule and systemic colonial endeavors) to understanding the social, cultural, and political project that is colonialism. While the terms colonialism, empire, imperialism, and even globalization have been employed to describe analogous processes, the realities behind colonialism are complex and systematically, structurally, and culturally catastrophic for the colonized. Colonialism can be critically discussed through three primary lenses: (1) the colonialism project as a structure of domination subjugating one group of people to another across political entities; (2) internal or domestic colonialism as a similar structure occurring within a given nation-state, typically against socially marked groups; and (3) the colonialism of the mind, wherein the colonized are institutionally, pedagogically, linguistically, and cognitively conquered by the colonizer.

Most common definitions of colonialism describe a general process in which a nation-state expands its territory as well as its social, cultural, and political structures into extant territories beyond its own national boundaries. Most standard definitions also describe a process in which...
Colonialism

one power exerts and maintains control over what ultimately becomes a dependent area or people. Yet such definitions are deeply insufficient for critical scholars of history, sociology, literary theory, anthropology, and other areas of study. Indeed, colonialism is a geopolitical, sociocultural, linguistic, and hegemonic project of domination and oppression rooted in the racialized and gendered contracts emerging out of Europe in the fifteenth and sixteenth centuries (see Mills 1997; Pateman 1988). As a project of the European Enlightenment, colonialism is critically seen not as aberration but as a purposeful design intended to spread a hegemonic structure whereby one people (“whites”) benefit from the exploitation and subjugation of another people (“nonwhites”). Colonialism is a form of systemic oppression and domination. The basic, descriptive form of colonization existed before the emergence a distinctly European, racist, hegemonic project (e.g., in the ancient empires of Egypt, Persia, Macedonia, Mongolia, China, and Central and South America). But while the processes of colonialism were of a radically different form, the consequences for those who were colonized in ancient times were as thorough and deep as they were for those colonized in Africa, India, Latin America, and other areas by Europeans in the eighteenth and nineteenth centuries. In the contemporary world, neocolonialism and imperialism often mirror earlier colonization efforts through complex and ultimately exploitative economic, military, political, social, and cultural processes. Many see such processes at work in various episodes of foreign intervention by the United States either directly (Grenada, Panama, Iraq) or indirectly (Chile, Cuba, Indonesia).

Understanding the oppressive and exploitative nature of colonialism in the world-system is crucial. However, solely attending to such processes across sociopolitical boundaries can divert critical awareness away from similar ideologies and structures of colonization within a given context. Indeed, similar processes and exploitative “contracts” have emerged within countries since the fifteenth century. In the U.S. context, several critical scholars (e.g., Andre Gunder Frank, Robert Blauner, Immanuel Wallerstein, Maulana Karenga, and Vine Deloria Jr.) have raised the question about whether groups such as African Americans and Native Americans represent internal colonies within the United States.

Questions surrounding internal or domestic colonization focus on the fulfillment of several structural components, highlighting the internal relationships of colonialism between oppressor and oppressed. First, if a particular group is politically disenfranchised within their own country (e.g., through electoral structure or limited access to discourse or positions), then that group may be an oppressed internal colony. Second, if the group in question is economically disadvantaged and exploited within the society it calls home, then the group represents the possibility of domestic colonization. Third, when members of a group are occupationally subordinated through segregation, impeded structural access to opportunities, or de facto discrimination and racism (e.g., African Americans or Native Americans), they are internally colonized within a matrix of colonialism. Fourth, when individuals in an ethnic or minority group are socio-psychologically humiliated through media misrepresentation, decentering (objects of history, rather than subjects) in education, and interactional isolation, they are part of an internal colony. Finally, minority groups often become culturally manipulated and commodified within their own societies through the market, the media, and campaigns of fear and consumption, and this can lead to domestic colonization. States often utilize the tools of colonialism against people within their own borders to effectively create internal colonies.

As the social landscape is also reflected and embedded within our mental and cognitive landscapes, existence within a structure of colonialism can affect individual and collective repertoires of action, thought, belief, and behavior. Thus, another lens through which one can view colonialism is that of the colonization of cultural, ideological, and cognitive terrains. The political philosopher Frantz Fanon, who was born in the French colony of Martinique, illuminated such a form of colonialism through his critical, structural, and psychoanalytic analysis of colonization. Fanon and others identified a “colonization of the mind,” an internalization of inferiority that persists long after colonial powers have physically left. While some authors have discussed the kind of moral and epistemological psychology needed for oppressors to engage in colonialism, writers from the Brazilian educator Paulo Freire to Fanon recognize that, in a system of colonialism, the oppressor, buttressed by the system and enjoying systemic privilege, maps systemic forms of domination within the minds of the oppressed that fundamentally alter strategies of resistance, protest, political opposition, and notions of individual and collective identities.

Colonialism, in the almost 600 years of its world-system domination, is a systemic, hegemonic, and totalizing form of oppression stemming from the project of European Enlightenment, and as such it has structured the world-system in favor of the West. While direct colonialism, through colonial rule, may eventually wither away through anticolonial movements and processes of “decolonization,” the effects of such a system linger in the international relations, internal structures, and mental cartography of the colonized. Such a structure has proved not only catastrophic for the colonized, but also, as Freire would argue, for the colonizer as well.

David L. Brunsma

COLONY, INTERNAL

During the 1960s in the United States there arose, in response to the militancy of the urban black masses, and secondarily because of the black power movement, a bur-
Colony, Internal

— are defined by certain processes and characteristics:

1. the colonized’s mode of entry into the dominant society, or into a relationship with the dominant society, is forced, not voluntary;

2. the indigenous values, orientations, and ways of life of the colonized are destroyed;

3. the colonized have a special relationship to the governing or legal order in which they view themselves as being managed and manipulated by outsiders;

4. the colonized are characterized as inferior on the basis of alleged biological characteristics, as part of a process of social domination by which they are exploited, controlled, and oppressed socially and psychologically; and

5. a separation in labor status occurs between the colonized and the colonizers.

A less widely known, but nonetheless influential examination of internal colonialism, Harold Cruse’s article “Revolutionary Nationalism and the Afro-American,” was published in Studies on the Left in 1962. Cruse placed internal colonialism in a broader historical context than most of the more popular exponents of the theory. He argued that the black domestic colony should be seen as a part of the worldwide colonial empire established by Pan-European capitalism. While the United States did not establish a colonial empire in Africa, it brought African colonial subjects home and installed them within the Southern states. From that time, blacks have existed in a condition of domestic colonialism everywhere within the United States. Cruse views the colonial revolution against capitalism, rather than the Western workers movement, as the leading edge of the revolutionary struggle. Some early 1960s black radicals, such as the Revolutionary Action Movement, took up Cruse’s position and circulated his article widely among other black radicals.

While most exponents of the internal colony theory have been political activists, the issue has also been taken up by some economists. William Tabb (1970) argued that there are two key relationships that must exist before the colonial analogy can be accepted: (1) economic control and exploitation, and (2) political dependence and subjugation. The maintenance of such relationships requires social separation and inferior status (p. 23). Tabb agreed with black radicals who argued that the spatial separation of colony from colonizer was secondary to the actuality of control from the outside. Bennett Harrison (1974) viewed the internal colony as a social entity similar to a “less developed country” with a severe ‘balance of payments’ deficit and with ‘foreign’ control of the most important local political and economic institutions” (p. 4). While he rejected the internal colonialism model, Harrison nonetheless saw striking similarities between the structural dualism pervading so many of the least developed countries and the segmentation of the American economy into a growing “core” and ghetto “periphery” (p. 6). Barry Bluestone (1969) expressed a more nuanced view of the ghetto economy. Like W. E. B. Du Bois in the 1930s, he argued that through developing the inner city economy the black community could gain the strength to win concessions from the government and corporate elites.

Ron Bailey (1973) stressed the racial dimension of internal colonialism. Bailey held that “race has always been a significant and relatively independent force in shaping material reality in capitalist society” (p. 162). He is critical of conventional Marxist analysis, which has not accorded race its proper significance, and has overlooked the centrality of “internal colonialism as the domestic face of world imperialism and the racist conquest and exploitation of people of color by Europeans” (p. 162). Bailey traces the black internal colony to the enslavement of Africans in the Americas as part of a global capitalist world-system. For Bailey, the black internal colony is a reservoir of superexploited labor, relegated to the lowest-paid and least-desirable jobs, and also supplies a large pool of unemployed workers that facilitates the exploitation of noncolonized workers. It is a zone of dependent development locked in the logic of spiraling impoverishment, and an expendable buffer zone used to cushion the antagonism-producing operations of the American capitalist economy.

Bailey argued that relations of monopoly and dependency were at the heart of the economic domination of the black internal colony. The black internal colony is a zone of white control both internally and externally. Whites control and monopolize the mechanisms of production, exchange, and distribution, in addition to mechanisms of economic diversification (banks, credit, technology). This dependent position of the black internal colony is a by-product of capitalist growth outside of the colony. The enclave structure of the black community generates employment outside the black community while black labor goes unemployed (Bailey 1973, p. 175).

For Bailey, dependency theory offered a set of organizing ideas that clarified how the black internal colony is a consequence of a set of historical forces and structures that consign it to underdevelopment and dependence (Bailey 1973, p. 176). Bailey concluded that the essential role of the black internal colony is to insure the smooth functioning of the relations of production and exploitation and that to guarantee the continued existence of this system, tokenism is used to pacify the black bourgeoisie.
Writing with Guillermo Flores (1973), Bailey argued that despite the affluence and power of the United States, “racial minorities remain unconquered by policies of forced assimilation, acculturation, and cultural extermination” (p. 158). Colonized minorities within U.S. borders are distinct from their people of origin, but also from white society within the United States, where they are rejected by the society that they helped build. For Bailey and Flores, the “national liberation struggles of racial minorities within the U.S. are important negations of U.S. capitalist domination inside its borders and converge with and strengthen the national liberation struggles of other third world peoples” (Bailey and Flores 1973, p. 158).

During the 1960s many in the United States came to equate the “colonial question” with the “social question.” This equation had been the basis of past coalitions, but there had also been controversy over which of the two was primary. The old Left had consistently argued for the leading role of the working class, but that position was forcefully challenged by the concept of internal colonialism during the concept’s heyday. By the 1980s one rarely found authors who supported the concept. Both Robert Allen and Robert Blauner recanted and adopted more pragmatic positions, in line with a change in the relations of force in favor of the dominant strata within the United States and on a world scale. In 2005, however, Allen published a reassessment in which he reassessed many of his earlier views.

**COLOREDS (SOUTH AFRICA)**

Contrary to international usage, in South Africa the term Colored does not refer to black people in general. It instead alludes to a phenotypically varied social group of highly diverse cultural and geographic origins. The Colored people are descended largely from Cape slaves, the indigenous Khoisan population, and other black people who had been assimilated into Cape colonial society by the late nineteenth century. Because they are also partly descended from European settlers, Coloreds are popularly regarded as being of “mixed race” and have held an intermediate status in the South African racial hierarchy, distinct from the historically dominant white minority and the numerically preponderant African population.

There are approximately four million Colored people in South Africa today. Constituting no more than 9 percent of the population throughout the twentieth century and lacking significant political or economic power, Colored people have always formed a marginal group. There has, moreover, been a marked regional concentration of Colored people. Approximately 90 percent live within the western third of the country, more than two-thirds in the Western Cape, and over 40 percent in the greater Cape Town area.

**ORIGINS OF COLORED IDENTITY**

In the decades after the emancipation of the Khoisan in 1828 and of slaves in 1838 the heterogeneous black labor-
RACIAL DISCRIMINATION AGAINST COLOREDS
The most consistent feature of Colored political history until the latter phases of apartheid was the continual erosion of the civil rights first bestowed nonracially in the Cape Colony by the British administration in the mid-nineteenth century. The attrition started in the late nineteenth century with franchise restrictions aimed at black voters. In the first decade of the twentieth century Colored people were excluded from the franchise in the former Boer republics after the Anglo-Boer War and were denied the right to be elected to parliament with the creation of the South African state in 1910. In the 1920s and 1930s, the economic advancement of the Colored community was undermined by the government's "civilized labor" policy of hiring white workers at high wages in the public sector, as well as by laws designed to favor whites over blacks in the competition for employment in the private sector. Furthermore, in 1930 the influence of the Colored vote was more than halved when white women were enfranchised, and Colored and black women were not.

It was during the apartheid era, however, that Colored people suffered the most severe discrimination. Their forced classification under the Population Registration Act of 1950, which categorized all South Africans according to race, made the implementation of rigid segregation possible. The Prohibition of Mixed Marriages Act of 1949 and the Immorality Amendment Act of 1950 outlawed marriage and sex across the color line, respectively. Under the Group Areas Act of 1950, over half a million Colored people were forcibly relocated to racially exclusive residential areas on the periphery of cities and towns, and in 1953 the Separate Amenities Act segregated all public facilities, creating deep resentment. In 1956, moreover, after a protracted legal and constitutional battle, the National Party succeeded in removing Colored people from the common voter's roll.

COLORED POLITICAL ORGANIZATION
Although the earliest Colored political organizations date back to the 1880s, the first substantive Colored political body, the African Political Organization (APO), was established in Cape Town in 1902. Under the leadership of the charismatic Abdullah Abdurahman, who served as president from 1905 until his death in 1940, the APO dominated Colored protest politics for nearly four decades. Until its demise in the mid-1940s, it was the main vehicle for expressing this community's assimilationist aspirations as well as its fears at the rising tide of segregationism. The failure of the APO's moderate approach contributed to the emergence of a radical movement within the better-educated, urbanized sector of the Colored community during the 1930s. Prone to fissure and unable to bridge the racial divisions within South African society, the radical movement failed in its quest to unite blacks in the struggle against segregation. Organized opposition to apartheid from within the Colored community was quelled by state repression following the Sharpeville shooting of March 1960, which initiated a harsh crackdown on the extraparliamentary opposition by the apartheid state. Organized Colored resistance only reemerged in the wake of the Soweto uprising of 1976.

RECENT DEVELOPMENTS
From the latter half of the 1970s, with the popularization of black-consciousness ideology within the Colored community, the nature of Colored identity became contentious as growing numbers of politicized people who had been classified "Colored" rejected the classification. The Soweto revolt of 1976 greatly accelerated this trend because it fomented a climate of open resistance to apartheid and fostered a sense of black solidarity. Coloredness increasingly came to be viewed as an artificial categorization imposed on the society by the ruling minority as part of its divide-and-rule strategies. The burgeoning of the nonracial movement in the 1980s under the leadership of the United Democratic Front fed Colored rejectionism.

In spite of this, the salience of Colored identity has endured. During the four-year transition to democratic rule under President de Klerk, political parties across the ideological spectrum sought support by making ever more strident appeals to Colored identity and postapartheid South Africa has witnessed a resurgence of Colored.
assertiveness. This has been due partly to a desire to project a positive self-image in the face of the pervasive negative racial stereotyping of Colored people and partly to attempts at ethnic mobilization to take advantage of the newly democratic political environment. It has also been motivated by a fear of African majority rule and the perception that, as in the old order, Coloreds were once again being marginalized. Though far from allayed, these anxieties have, in recent years, been alleviated by the fading influence of “black peril” tactics in South African politics and by the acculturation of people to the new political order.

COLORISM

Colorism is the allocation of privilege and disadvantage according to the lightness or darkness of one’s skin. The practices of colorism tend to favor lighter skin over darker skin, although in rare cases the opposite practice also occurs. Colorism is present both within and among racial groups, a testament to its role as something related to but different than race. Colorism is enacted among racial groups in various contexts, from preferences in classroom settings and hiring decisions to patterns in sentencing. For example, it has been shown that lighter-skinned minorities, particularly blacks and Latinos, attain a higher educational level and a higher workforce status than darker-skinned minorities. According to research by Arthur Goldsmith, Darrick Hamilton, and William Darity (2006), employers tend to prefer light-skinned black employees over dark-skinned black employees. Further, their research indicates that there is a much greater discriminatory wage penalty for darker-skinned African American men compared to their lighter-skinned counterparts. That is, lighter-skinned African American men tend to earn higher wages compared to darker-skinned African American men.

Studies by Verna Keith and Cedric Herrington (1991) as well as those by Margaret Hunter (2002) suggest that the effect of skin tone remains even when other socioeconomic factors such as parental income and educational statuses are controlled. Further, a study by Trina Jones (2000) demonstrates that darker-skinned blacks receive longer sentences than lighter-skinned blacks for crimes against whites, despite similarities in criminal records. Similarly, research by Jennifer Eberhardt, Paul Davies, Valerie Purdie-Vaughns, and Sheri Lynn Johnson (2006) demonstrates that “blacker-looking” African American males are more likely to receive the death penalty compared to their lighter-skinned counterparts for comparable capital crimes. Their findings remain significant even after controlling for defendant attractiveness and other nonracial factors that are typically known to influence sentencing, such as murder severity or victim’s socioeconomic status. Most social scientific studies of the effects of colorism have shown that there has been little improvement in this form of discrimination since the civil rights movement in the 1960s.

However, previous research on colorism tended to focus on color-based discrimination within racial groups, as evidenced by the historical existence of such groups as the Blue Vein Society, a black-created social club that excluded dark-skinned blacks. Studies show that nonwhites tend to embrace the beauty standards prevalent in most societies, which grant a higher desirability to lighter skin than to darker skin. This has been shown to affect not only the self-worth of nonwhites but also mate selection. Light skin attains a higher socioeconomic status in its own right, through greater access to education and workforce mobility; lighter-skinned nonwhites also disproportionately attract spouses with higher socioeconomic statuses. Most studies have found that gender interacts with the effect of skin tone, making lighter skin a form of social capital for both black women and Latinas, again having an impact that cannot be explained by generational privileges alone. Famously explored in Wallace Thurman’s novel The Blacker the Berry … (1929) and Toni Morrison’s The Bluest Eye (1970) but rarely discussed openly, colorism is a continuing line of discrimination among and within racial groups worldwide. Although frequently collapsed into discussions of racism, colorism often occurs independently of racism, thus meriting independent analysis.

Racism and colorism share some commonalities, despite being independent practices. Fundamentally, both
ideas of race and perceptions of skin color are social constructions, created in historically specific contexts and used to justify various practices of power. Although racial boundary drawing often involves perceptions of skin color, skin color alone rarely has been the sole determinant of racial categorization. At the same time, within racial categories there exists a wide range of skin coloration and various other physical attributes that are given social meaning in the process of allocating power and status. Thus conflating racism and colorism misses a distinct mode of stratification. With colorism, discrimination is not based on racial categorization but rather on assumptions about the meaning associated with one’s skin color. In this way, we can distinguish racism as the social meaning associated with one’s racial group and colorism as the social meaning associated with one’s pigmentation.

Although colorism is frequently found in societies whose histories include a significant era of European colonialism, colorism has also been noted in Japan, a nation whose history does not involve a Euro-colonial past. This has allowed some scholars to explore the symbolic dimensions associated with colorism’s typical privileging of lightness over darkness. In many differing cultural contexts, whiteness or lightness often has been associated with purity, cleanliness, beauty, intelligence, morality, and civilization, whereas in deliberate contrast, blackness or darkness has been associated with sin, filth, ugliness, stupidity, deviance, and backwardness. Anthropologists estimate that out of 312 cultures worldwide, 51 use skin color as a determinant of beauty. Among them, only four contain a preference for dark skin over light.

Such symbolic associations have in many cases justified the political and economic strains of colonialism, which play a central role in the origins of colorism. In Brazil, for example, the Portuguese invasion in the sixteenth century created a color hierarchy that persists in the early twenty-first century. Although roughly 80 percent of Brazilians are of African or indigenous descent, whites still are privileged politically and economically. A similar correlation of color and privilege is found throughout much of Latin America. In India traces of colorism favoring light skin are known to have existed before British colonial rule. Under the caste system, skin color and caste shared a similar gradient of privilege, and even in the early twenty-first century color-based tensions pervade Indian society.

In the United States the arrival of Europeans initially fostered race mixing, although with increased entrenchment of power among European descendants, particularly after the beginnings of slavery, an effort was made to draw clear (albeit biologically arbitrary) boundaries among the races. Antimiscegenation laws, such as the “one-drop rule” or “hypo-descent rule” that proclaimed that any amount of African ancestry was enough to constitute legal or social black status and that classified people racially as the subordinate group, were first created in response to moral questions over slavery for mixed-race individuals. For instance, throughout most of U.S. history and in some regions in the U.S. in the early twenty-first century any person with a trace of African ancestry has been considered black. In the Deep South during the era of slavery, although children of white plantation owners and their slave mistresses often were treated harshly and faced conditions similar to other slaves, these children in some instances were given coveted indoor jobs. In a few instances they also were given freedom, property, and even their own slaves. The social status associated with such freedom and ownership was a privilege for many mixed-race individuals, who after emancipation worked to self-segregate from darker-skinned blacks via elite social clubs and various churches, colleges, and other social institutions that were open to light-skinned blacks only, perpetuating a color-based gradient of privilege that persists in the early twenty-first century.

Although there have been substantial challenges to the practice of colorism, ranging from Marcus Garvey’s criticism of W. E. B. DuBois to Spike Lee’s challenging film School Daze, colorism is still widely practiced within and among racial groups. As long as lighter skin allocates disparate practices in housing, education, employment, sentencing, and perceptions of beauty, it remains a significant line of stratification.

COLUMBUS, CHRISTOPHER

c. 1451–1506

School children across the United States immediately recognize the name Christopher Columbus. He has assumed iconic status as the instigator of European imperialism in the Americas. Much of the historical Columbus, though, became obscured by eighteenth- and nineteenth-century mythology that valorized the sailor.

Christopher Columbus (Cristóbal Colón in Spanish, Cristoforo Colombo in Italian) first approached the king of Portugal in 1484 with a bold plan to reach Asia by crossing the Atlantic Ocean. The king’s advisors, however, scorned Columbus’s ideas. Contrary to folklore, most educated Portuguese conceptualized the earth as a sphere by 1484. Skeptics of Columbus’s plans, in other words, did not believe that Columbus would sail off the edge of a flat world. Rather, Columbus’s dubious calculations about the size of the earth troubled many in the Portuguese court. Columbus proposed that only three thousand nautical miles separated Europe and Asia, a distance that ships of the day could easily traverse. Portuguese authorities did not know about the existence of North and South America, but they understood, based on their own calculations, that Columbus had seriously underestimated the globe’s size. Indeed, reaching Asia via the Atlantic would mean traveling a distance of 10,600 nautical miles, more than three times the distance Columbus predicted. Portuguese scientists conjectured that Columbus and his crew would starve before reaching Asia, and they likely would have had they not happened upon the Western Hemisphere. Rather than adopting Columbus’s westward plan, Portugal banked on reaching Asia by voyaging around Africa.

Rejected by Europe’s major naval power, Columbus looked to Portugal’s emerging rivals, Spain’s Queen Isabella (1451–1504) of Castile and King Ferdinand (1452–1516) of Aragon. When Isabella and Ferdinand married, they united Spain’s two largest kingdoms and ruled jointly. Isabella initially rejected Columbus’s proposals as fantastical and expensive. Columbus persisted for seven years, however, eventually winning Isabella’s approval on his third official proposal. Ferdinand later claimed credit for convincing Isabella to set aside her misgivings about Columbus. The Catholic sovereigns financed Columbus, offered him the title of governor for the lands that he claimed for Spain, and provided him with a modest fleet of three ships: the Niña and Pinta, two caravels, and the Santa María, a square-rigged vessel.

Columbus’s ships crossed the Atlantic in twenty-nine days. The crew aboard the Pinta first spotted land on October 7, 1492, and made landfall three days later. Columbus encountered the indigenous Taíno (or Arawak) on Guanahani island, which he renamed San Salvador. During his first voyage, Columbus scouted various other islands throughout the Caribbean, including Hispaniola (now Haiti and the Dominican Republic) and Cuba.

Columbus did not understand or accept that he had arrived on lands unknown to contemporary Europeans. Instead, he steadfastly claimed to have reached Asia. The inexperienced navigator believed Cuba’s mountains to be India’s Himalayas, and he thus dubbed the indigenous people Indians.

Having lost the Santa María off the coast of Cuba, Columbus set sail with the Niña and Pinta for Spain on January 4, 1493. Encountering wicked storms and bad luck, he did not return to Castile until March.

Columbus found much glory when he entered the royal court. Spaniards marveled at the many unknown items he displayed from his first voyage, including a tobacco plant, a turkey, and a pineapple. He also showed several kidnapped natives, whom Columbus suggested would not interfere in Spain’s colonization efforts.

Columbus’s second voyage to the Western Hemisphere, which lasted from 1493 to 1496, showed the brutality and limits of European imperialism. Columbus had seventeen ships and 1,200 men to colonize the Taíno and Arawak territory. He created an elaborate design for the colonial capital, which he named Isabella. The town and expedition, however, largely failed.

Columbus navigated and charted islands in the Caribbean, including Puerto Rico. He also advocated enslaving the indigenous populations. Though Isabella and Ferdinand shunned the idea of outright enslavement, Columbus ultimately took 1,600 Arawaks into bondage. He dispatched around 550 of these Arawaks to Spain, but almost half died during the journey. Those who did survive spent a lengthy time imprisoned as Spain’s legal system decided their fate. Ultimately, Spain ordered that they be shipped back to their native lands.

Columbus continued to petition the monarchy to consider their new colonies as a source for slaves. They, however, consistently refused. The monarchs’ refusals over
unconditional slavery, however, did not mean that they did not expect the indigenous to labor on their behalf as repayment for their conversion to Christianity.

Perhaps the greatest brutality during the second voyage resulted from the Spaniards' search for gold. Though they found some precious metals, Columbus's men could not locate the massive reserves that he had imagined existed. On the island of Haiti, Columbus imposed an unrealistic quota system on the indigenous population. The governor ordered the hands chopped off of any adult over the age of fourteen who failed to reach his quota in the gold mines. Even with this viciousness, Columbus failed to collect much gold during his second journey. He left behind, however, several permanent colonies for Spain.

Columbus's third journey to the Americas was notable for two reasons. First, a young Bartolomé de las Casas (1474–1566) traveled onboard one of the six ships. Las Casas would later gain fame for chronicling the abuse of indigenous people at the hands of Spain's colonists. Second, royal authorities arrested Columbus on August 23, 1500. Many of the colonists had grown angry with Columbus and his unfulfilled promises of wealth. Spain's monarchs eventually released Columbus, but stripped him of his title of governor.

Columbus's final trip to the Western Hemisphere lasted from 1502 to 1504. During this voyage, Columbus continued to hunt for gold and other material treasures. He made landfall in Central America, probably along the coasts of the modern-day nations of Honduras, Nicaragua, and Costa Rica. Bad weather, though, ultimately resulted in Columbus spending most of his final year in Jamaica. He returned to Spain on November 7, 1504, and never returned to the Americas again.

Columbus spent the last few years of his life fighting court battles in Spain. The seafarer sued the Spanish Crown, demanding it honor its original contract with him, which guaranteed 10 percent of the profits from his explorations. The court battles ultimately extended across five decades, with Columbus's heirs losing the fight.

COLUMBUS'S LEGACY
Columbus's entry into the Western Hemisphere radically changed the direction of Europe, Africa, and the Americas. Ideas about imperial expansion had already become part of Europe's most powerful kingdoms. European society quickly recognized that they could use their existing technology to colonize lands previously unknown to them.

In 1494 Spain and Portugal almost went to war over control of the world. Spain argued that the route and lands encountered by Columbus belonged to them. Portugal countered that Columbus could not have succeeded without Portuguese technology. Pope Alexander VI (1431–1503) negotiated a settlement, the Treaty of Tordesillas (1494), that pleased both Spain and Portugal. Essentially, the pontiff divided the globe on a line located 270 leagues west of the Azores. Any lands west of that line went to Spain, any lands to the east went to Portugal. Europeans had little idea of the size or shape of the Americas, but the line resulted in Portugal's claims to Brazil and Spain's initial dominance in North America. Alexander VI and the Iberian powers ignored whatever concerns the indigenous inhabitants might have had about this arrangement.

Most historians argue that Iberian subjugation of the Canary Islands became the model for the initial settlement of Europeans in the Western Hemisphere. Establishing colonies in the Canary Islands created imperial apparatuses for controlling lands and populations thousands of miles away from the center of government. Ostensibly a mission of religious conversion, Christian invaders interpreted resistance as a divine sanction for their colonial enterprise. Moreover, authorities rarely recognized the rights of baptized Canarians. Within a short period, Iberians sold tens of thousands of Canarians into slavery and confiscated their lands.

Columbus's immediate legacy, therefore, involved Spain importing these brutal methods to take control of indigenous lands in the Americas. By 1512 as many as ten thousand Spaniards lived in Hispaniola, supported by the forced labor of the original inhabitants. Puerto Rico, Cuba, and all the lesser islands soon fell to Spain's conquistadors. The Arawaks and Caribs faced exploitation under the guise of religious conversion.

Starting around 1515, Spaniards began to construct sugar mills, importing both technicians and African slaves to replace the indigenous people dying from disease and mistreatment. In 1519 Hernando Cortés (c. 1484–1547) entered to the core of the Aztec Empire in the center of modern-day Mexico. By 1600 Spain's imperial authority extended from the Río Grande del Norte to the Río de la Plata in southern Peru. Other European powers soon followed, including Portugal, Britain, France, and the Netherlands.

European invasion of the Americas brought profound suffering and death to indigenous groups. Overwork and lack of adequate provisions compounded the spread of disease as epidemics ravaged the Americas. The Mesoamerican population dropped from more than twenty million to as little as two million during the first century of contact. Populations on the Greater Antilles almost entirely disappeared.

Many historians frame Columbus's legacy around notions of exchange. As already suggested, the most profound exchange that occurred involved the transmission
of diseases. Europeans brought typhus, measles, strains of influenza, and smallpox to the Americas for the first time. Some debate exists about whether syphilis originated in the Americas and, therefore, had been previously unknown in the Eastern Hemisphere. Recent studies, however, suggest that Europeans already had experiences with syphilis before Columbus set sail.

Outside of disease, the exchange of different plants, animals, and cultural practices radically altered the landscape and diets of Europeans, Africans, and Native Americans. Native Americans had never seen pigs, sheep, sugar, or domestic cattle. Arguably the most important addition, however, was the horse. Horses had not roamed the Americas since the last Ice Age. Native Americans quickly adapted the horse to their needs, using them for hunting, transportation, and warfare.

American crops, likewise, transformed European and African life and nutrition. Columbus brought back nutrient-packed maze (corn) on his first trip. During the next century, American beans, squash, potatoes, peppers, and tomatoes all became European staples. Tobacco became a prized commodity in Europe by the seventeenth century. Columbus’s voyage also had tremendous significance for Europe’s minority populations, particularly the Jewish community. On March 30, 1492, less than a month before Columbus signed his crown contract, Isabella and Ferdinand issued a decree expelling Jews from Spain. Those Jews who did not convert to Christianity by August 2 forfeited their property to the royal couple and had to leave their kingdom.

Jews had already faced centuries of persecution throughout Europe. A sizable group opted to convert to Christianity, some out of religious faith, others for expediency. Their Christian neighbors, however, continued to disdain these conversos (converts), despairingly naming them maranños (literally, swine). Many conversos, often referred to as crypto-Jews, secretly maintained their Jewish faith and practices. This community, however, faced dire consequences if discovered. Under the Catholic Church’s Inquisition, these conversos came under intense scrutiny. Church authorities executed any conversos who showed signs of practicing Judaism.

Columbus benefited from both the Jewish community and also their persecution. While in Lisbon, Columbus consulted with prominent Jewish and converso scientists like Joseph Veinho and Martin Behaim (1459–1507). Columbus also received substantial funding for his expedition from a converso in Ferdinand’s royal court. Moreover, he employed numerous conversos in his crew, some just barely out of the Inquisition’s clutches. Many recently baptized Christians even held key positions in his first fleet, including Rodrigo Sanchez, the comptroller; Alfonso de la Calle, the second mate; Maestro Bernal, the physician; and Luis de Torres, Columbus’s interpreter.

The purge of Jews from Spain, though, also provided part of the royal funding for Columbus’s various voyages. Seizure of Jewish property provided an immense budget for the second voyage, in particular. Much of the money for that expedition derived directly from the confiscation of Jewish lands and valuables, including some priceless synagogue artifacts.

Spain’s expansion into the Americas, though, also provided unexpected opportunities for conversos and crypto-Jews. Colonization’s first century offered a literal escape from Europe’s Inquisition. Though officially forbidden from settling in Spain’s new colonies, conversos often found the royal court more than willing to sell exemptions. If one could not obtain royal sanction, captains in the imperial navy also showed themselves ready to provide transport for the right price. By the 1630s, conversos could be found in almost every town in Spain’s empire. Frontier locations, such as New Mexico or Florida, attracted a disproportionate number because of their remoteness from the Inquisitors’ grasps.

THE HISTORICAL COLUMBUS AND THE COLUMBUS LEGENDS

Though widely known today, Columbus’s name had almost been forgotten even before his death in 1506. In December 1500, Amerigo Vespucci (1454–1512) published a sensational account of his travels across the Atlantic. Vespucci claimed credit for finally establishing that Europeans had encountered previously unknown continents in the Western Hemisphere. When an authoritative German cartographer printed the first major world map in 1507, he gave the continents the name America, a feminine version of Vespucci’s first name.

During the eighteenth century, however, Columbus’s fame experienced a resurgence thanks, in part, to the tensions between North American colonists and the British government. As early as 1700, British colonists used Columbia as another name for the Americas. After U.S. independence, the historical Columbus and the feminine coinage Columbia became symbols for distinguishing the fledgling republic from its European counterparts. King’s College in New York, for instance, found a new start as Columbia College. In 1791 the seat of government became known as the District of Columbia. Though 1692 passed with little fanfare, the leaders of the newly created United States made 1792 a year of fetes. Celebrating three centuries since his first journey, U.S. leaders declared Columbus the first “American” hero.

Columbus gained even greater notoriety with the publication of Washington Irving’s (1783–1859) three-volume biography in 1828. Publishers have issued over
ambitious DNA research project. Composed of scientists from Spain, the United States, Italy, and Germany, this team hopes to use the known remains of Columbus's brother and son to end the controversy about Columbus's origins.

COMEDY
The social sciences have led the way in the scholarship on humor, looking to social dynamics to explain what people find funny, and why they find it funny. This enquiry began with Le Rire: Essai sur la signification du comique (1899), in which the French philosopher Henri Bergson, thinking as a social scientist might, explored how comedy depends upon the rupture of socialized standards of group behavior. A few years later, Sigmund Freud, in Der Witz und sein Beziehung zum Unbewussten (Jokes and Their Relation to the Unconscious, 1905), posited that it was the violation of social constructs (functions of the ego and superego) that makes people laugh.
Bergson would go on to cite “the worthless act” as a central component to laughter in the modern and mechanized world, explaining in “Laughter: An Essay on the Meaning of the Comic” (1911) that humor allows one to distance oneself from the dehumanizing effects of modern, civilized life. Modern scholarship might be said to begin an extension of this logic, looking not only to the essence of humor but also to its social functions. The Czech sociologist Antonín Obrdlička’s “Gallows Humor, a Sociological Phenomenon,” which first appeared in the March 1942 edition of the American Journal of Sociology, argued that “gallows humor” served as relief from the devaluation of human life at the hands of the Nazis.

Since World War II, the social sciences have continued to explore the social functions of humor, often contextualizing these functions by way of well-established theoretical models. In his introductory textbook *Humor and Society* (1988), Marvin R. Koller addresses the work of Obrdlička directly, examining gallows humor as an example of “relief theory.” Koller then contextualizes relief theory as one of four “macrotheories of humor,” the others being “ambivalence theory” (an embracing of a social construct while simultaneously holding it at arm’s length), “superiority theory” (excluding other social groups from human commerce by way of pronouncing one’s own their “betters”), and “incongruity theory” (reminding us of the perils in thinking we have codified our world more definitively than we have). As any seasoned sociologist will recognize, these theories are familiar approaches drawn from elsewhere in the discipline. Nonetheless, they are profitable means of categorizing and appreciating how humor is more than simply “funny.”

A second contribution to humor scholarship has come from the willingness of the social sciences to look at how people find funny can be determined by the groups of which they are a part. The social sciences in general, and sociology in particular, have explored the nature of humor by gender, by medium (e.g., print, television, motion pictures), by region, by professional group, and by race. Surely the most impressive scholarship in this regard has explored the relationship between humor and ethnicity. The early work in this area often employed “conflict-aggression” interpretations of ethnic humor, depicting ethnic humor as a means of ranking ethnic groups in a social hierarchy. More recent work though has found the phenomena to be flexible, even fluid. Christopher Davies, in *The Mirth of Nations* (2002), suggests that Polish jokes, for instance, ebb when definable tensions between Poles and other groups are most pronounced. Conversely, Polish jokes flourish when tensions are lowest.

The reach of scholarship in the social sciences is at once broad and deep. The work is yet to be fully synthesized however. Initially spread across psychology, sociology, and anthropology, it is now also found in related fields such as philosophy, communications, folklore, and media studies. Hence, the most exciting scholarship is more often discovered in articles in interdisciplinary journals than in full-length books devoted to a particular social-science discipline.

**COMIC BOOKS**

Comics have a long history, especially in Europe, Japan, and the United States. The Arab states, China, India, Mexico, and South America also contribute to this history. U.S. comic books have played an important role in the entertainment industry, attracting varying degrees of academic attention since regular publication began in the late 1920s. The earliest U.S. comic book was Rodolphe Töpffer’s *The Adventures of Obadiah Oldbuck*, published in September 1842. In 1896 Richard Outcault’s *The Yellow Kid* became the first syndicated newspaper comic strip published in color. Dates for early comics vary depending on new discoveries and evolving definitions; Scott McCloud’s *Understanding Comics* (1993) is considered a classic in defining comics.

Early U.S. comic books were compilations of Sunday newspaper comics. The importance of twentieth-century comics has been partially mapped out in Ian Gordon’s *Comic Strips and Consumer Culture, 1890–1945* (1998) and Thomas Inge’s *Comics as Culture* (1990); both analyze how comics sold newspapers, generated a vast array of merchandising, and influenced U.S. culture and language.

In 1938 Superman appeared in *Action Comics* number 1. The growth of comic book publishing expanded until the 1950s. The height of the comics industry occurred from 1950 to 1954. Americans spent close to $1 billion on comics and there were comics readers in more than 40 percent of U.S. households. A variety of genres existed, comprising over 600 titles. During the 1950s public opinion turned against comic books, due in part to Fredric Wertham’s *Seduction of the Innocent* (1954).
Although the medium was perceived by most as children’s literature, publishers were adapting to an aging readership who wanted more violence, sex, satire, and political/adult themes. The protests, spurred in part by Wertham’s book, general public outcry, and a congressional hearing, resulted in the industry’s self-censoring comics code, a sanitizing of comics, and a major drop in sales. Among the long list of dos and don’ts, the code regulated acceptable versus unacceptable titles (e.g., titles could not contain the words “horror,” “fear,” or “terror”), established a modest dress code for female characters, ensured that good would always win over evil (criminals were always caught), and reduced violent scenes (e.g., blood, decapitation, and torture were not allowed). The code also regulated language use, not allowing swear words or language alluding to sexual situations.

The 1960s saw two important developments. First, in mainstream comics, Marvel Comics slowly became DC Comics’s major competitor by creating a new line of superheroes marketed to an emerging and economically important youth culture. These new superheroes were young, and some were teenagers themselves. Most of them acquired their powers through some type of accident or experiment related to radiation, and the story lines centered around the superhero’s personal problems and struggles to understand and use the newfound powers. These new comics also made reference to current social issues such as drug use, the counterculture, the different social movements, and racism. The heroes of these comics included Spiderman, the Incredible Hulk, X-Men, and the Fantastic Four. The Black Panther and Luke Cage, the first African American superheroes, were an important addition, even though their earliest appearances followed a trend toward “blaxploitation” as opposed to a serious look at race issues. In the 1970s superheroes became more socially relevant and serious. Marvel revamped or modernized many earlier superheroes such as Captain America and Flash in a further effort to make their comics more relevant in terms of the youth culture and society at large. Marvel and DC Comics remained the dominant comics publishers, becoming almost indistinguishable in content until the 1980s, when DC Comics released their Vertigo line for more mature readers.

The second important development during the 1960s was the birth of underground “comix,” which reflected counterculture sensibilities and rebelled against the comics code and social taboos. Important cartoonists from this period include Robert Crumb, Justin Green, Richard “Grasshopper” Green, Michele Brand, and Roberta Gregory. The undergrounds were especially important in terms of their influence on a future generation of comics creators and the types of innovative comics that emerged during the late 1980s and continued through the first half-decade of the 2000s.

After comics’ silver age in the 1970s, significant developments began in the 1980s. The code weakened, many comics publishers ceased carrying the code’s seal, or in addition to coded books, they carried a “mature” line which did not carry the seal. Groundbreaking works appeared, including Alan Moore’s Watchmen, Frank Miller’s The Dark Knight Returns, Art Spiegelman’s Maus, and the Hernandez brothers’ Love and Rockets. Independent and alternative publishers such as Dark Horse Comics, Fantagraphics, and Image lessened DC Comics’s and Marvel Comics’s control of the market. Self-publishing (e.g., Dave Sim’s Cerebus) further expanded comics’ potential as a diverse art form.

The term graphic novel became popular beginning in the late 1970s. Initially, the term was used to distinguish artistic or novelistic comics from mainstream, superhero comics. Some early examples include Contract with God by Will Eisner, First Kingdom by Jack Katz, and Sabre by Don McGregor and Paul Gulacy. Later, the term was used exclusively as a marketing tool and applied to hardback or paperback “drawn novels,” collected superhero story-arcs, longer book-length comics, and anthologized comic strips (for example, The Far Side and Calvin and Hobbes).

Importation of European and Japanese comics (manga) saw a marked increase in the 1980s (and the importance of manga in the U.S. market continued through 2006). Finally, the 1989 film release of Tim Burton’s Batman spawned other comics-related films and video and computer games. These trends grew exponentially during the first half-decade into the 2000s. Superhero stories accounted for most of the films’ adaptations, but there were also adaptations of novelistic and slice-of-life comics (e.g., American Splendor, Ghost World, and Road to Perdition). Major book publishers such as Random House began publishing “drawn novels,” and more book-length comics appeared without prior serialization; examples include Marjane Satrapi’s Persepolis, Craig Thompson’s Blankets, and Chris Ware’s Jimmy Corrigan: The Smartest Kid on Earth.

Academic attention to comics increased substantially in the 1990s and continued through the first half-decade of the 2000s. Scholarly analysis focuses on comics history, fandom, the inner workings of the comics publishing and distribution industry, defining comics by applying formalist or structuralist theories, applying literary theory or semiotics for interpretation and analysis, and analyzing comics’ cultural impact.

COMMON GOOD, THE

The common good refers to activities or policies that benefit the community. It is concerned with the well-being of the group as opposed to simply the interests of a particular individual or subgroup. What this well-being actually involves, however, is not self-evident. There is no generally accepted method for identifying the common good. Nonetheless, scholars have offered a number of theoretical approaches, which can typically be categorized as either liberal or communitarian.

A fundamental distinction between these two theoretical orientations is how they conceptualize the relationship between the individual and community. The liberal perspective tends to understand the community in terms of its individual members. The whole is considered the sum of its parts. Consequently, the common good is based on the interests of the individual members. The communitarian view, in contrast, conceives of the community as having ontological priority over its individual constituents; that is, the community has an existence that goes beyond its membership. The whole, therefore, is seen as greater than the sum of its parts. In this case, the community provides the standard for determining the common good.

Liberal theories share the general notion that the common good should be based on individual preferences and interests, which are all weighed equally. Examples of liberal procedures include utilitarian, deontological, and deliberative. Utilitarianism generally associates the common good with maximizing social welfare. Its basic goal is to produce the greatest overall utility for the greatest number of individuals. Utility, however, may be defined differently depending on the version of utilitarian theory being considered. Deontological approaches connect the common good to the maintenance of individual rights. These rights are considered inalienable; they cannot be taken away. Deontological theories identify sets of opportunities and resources that should be enjoyed equally by all individuals. Deliberative methods attempt to identify the common good through democratic discourse. Ideally, individual members of the community deliberate together and reach a consensus about what the common good entails. The outcomes of public deliberation are considered legitimate if the procedure meets certain requirements such as fairness, rationality, and reciprocity.

Communitarian theories assume communities have distinct ways of life shaped by custom and tradition. The common good, in this situation, involves advancing and maintaining the community’s particular way of life. It identifies communal ends that are to be collectively embraced and pursued. Individual interests and preferences are seen as subordinate to the common good, which reflects the transcendent good of the community. Communitarian theories do not necessarily neglect the desires and needs of individuals; members, however, are expected to prioritize and share in their community’s way of life. The common good, therefore, requires that individuals put aside their personal concerns in favor of communal goals.

In practice, liberal and communitarian attempts to achieve the common good reflect their respective emphases on the individual and community. The liberal approach often advocates the extension of social welfare for individuals and the protection of individual rights. The communitarian approach typically uses public institutions to inculcate civic virtues, facilitate social solidarity, and take care of the public welfare. The former advances the interests of individuals, while the latter promotes the well-being of the community.

Johnny Goldfinger
just on their own actions (strategies) but also on the actions of the others, they are playing a game. Each is rational when acting instrumentally to maximize his or her subjectively expected utility associated with the outcomes, and the game is a common knowledge of rationality (CKR) game when, in addition, (1) each knows that each is rational, and (2) each knows that each knows that each is rational, and so on in an infinite chain of recursively built knowledge.

The purpose of CKR is to place each agent, so to speak, in the mind of others with the result that no one will behave in a manner that surprises. In particular, CKR licenses the iterative deletion of dominated strategies. Strategies are dominated when they yield a worse outcome in every eventuality than some other available strategy (for example, the cooperative strategy in a prisoners’ dilemma game).

Thus in a two-person game, when \( A \) knows that \( B \) is rational, he or she knows that \( B \) will not play a strategy that is dominated (so any such strategy can be effectively deleted). \( B \), knowing this, also knows that \( A \) will not select a dominated strategy in terms of the payoffs that remain once \( B \)’s dominated strategies have been removed, and any such strategy of \( A \) can now also be ignored and so on. The strategies that remain are now referred to as rationalizable (Pearce 1984; Bernheim 1984); and in some, but far from all, games the result is a single strategy for each player (i.e., a unique prediction for rational agents will do).

It was sometimes thought that CKR delivered something potentially stronger: the Nash equilibrium solution concept, which identifies rational action with strategies that are best responses to each other. It is now typically accepted that in general the Nash equilibrium solution concept has to be motivated not only by CKR but also an assumption of common priors whereby rational agents hold a common view as to how a game will be played rationally. If there is such a unique, albeit possibly probabilistic, way in which each rational agent will play the game, then it will be apparent that, with CKR, rational actions must be best replies to each other (otherwise at least one agent would not be acting rationally).

CKR is sometimes modified so that agents only engage in some fixed level of reasoning of this sort. Thus first-order CKR refers to the case where \( A \) knows that \( B \) is rational and vice versa. Second-order CKR has in addition that \( A \) knows that \( B \) knows that \( A \) is rational and so on. Given the brain’s limited processing capacity, this is often more appealing than full-blown CKR; and in experiments, it seems that most people rarely engage in more than second-order CKR (see Camerer 2003).

**COMMON LAND**

Common ownership of land, or a commons, is one of the most enduring social systems for owning and managing natural resources. Common land is controlled and managed by a defined group of people—tribes, peasants, and civic associations—for the collective benefit of its members.

This social regime of land management was the norm in prehistoric and medieval times, and it persists in the twenty-first century around the world, especially in developing countries. Even developed countries such as the United States have modern variants of common land, including land trusts, neighborhood-managed parks, and community-supported agriculture.

Common land stands in contrast to land owned as private property, in which individuals may possess the land and exclude others. It is also distinct from public land, in which government determines who may use the land and how, and from open access land, in which there are no property rights and no restrictions on how land may be used.

Collectively managed land has been a familiar socioeconomic institution in Latin America, Africa, Asia, India, and many developing nations for millennia. In societies with limited wealth and civil infrastructure, a commons provides an environmentally sustainable way to manage and allocate farmland, forests, water, wild game, and other natural resources. It also provides a certain measure of social equity in access and use of such resources. Community norms and sanctions tend to prevent anyone from abusing the land or appropriating more than his due share.

Since in a commons everyone is personally rooted to the land, there are keen incentives for responsible stewardship of resources. For this reason, common land systems

---

*Common Land*
tend to promote long-term sustainability over short-term productivity.

Since the 1990s a branch of political science and economics has studied the dynamics of “common-pool resources,” or CPRs. Much of the case literature focuses on the specific ways in which communities in developing nations manage shared natural resources. Professor Elinor Ostrom of Indiana University is widely credited with pioneering research into common-pool resources in the early 1990s. Much work in the field is associated with the Workshop on Political Theory and Policy Analysis at Indiana University and the International Association for the Study of Common Property. The Digital Library of the Commons is a major online repository of academic monographs and bibliographies about a wide variety of commons.

THE FEUDAL COMMONS
In Western societies, the classic embodiment of a common land regime is the commons of feudal England and Europe. In this system, a medieval baron or lord was involved in a dense web of reciprocal economic and social relationships with peasants. In return for giving military service, a portion of crops, and personal loyalty to the manor, peasants shared usage rights to the manor’s arable farmlands, pasture, and “waste” (forests, ponds, wetlands). Commoners might till their own individual strips of land, but no one had exclusive possession of the land or unrestricted freedom of use. Everyone’s usage of the land was dependent upon the needs of the rest of the community.

Although this medieval system of commons was quite stable and sustainable, it required plentiful supplies of labor, and was not especially efficient or open to innovation. The system began to experience serious pressures, therefore, when the Black Death of the fourteenth century killed millions of people, and in the fifteenth and sixteenth centuries, when peasants often left the manor for towns in order to become tradesmen and entrepreneurs.

Further pressures on the commons arose when the landed gentry of England saw the money-making potential of wool production and trade with Europe. Especially in the seventeenth and eighteenth centuries, the nobility persuaded Parliament to override the common law and authorize it to “enclose,” or privatize, the commons. This expropriation of common land cleared the way for a more efficient market use of common lands, and inaugurated the modern system of private property rights in land.

But the enclosures also caused enormous social disruptions and hardship as commoners were left to fend for themselves as landless, unskilled laborers. People whose lives were once nestled in stable, hierarchical communities that assured access to life-sustaining food, fuel, and house-hold resources were thrust into a churning market order of shifting social roles and uncertain employment.

THE TRAGEDY OF OPEN ACCESS
In response to the triumph of capitalism and the decline of the commons, many modern economists and policy experts have come to believe that land cannot be managed effectively as a shared resource. Perhaps the most notable statement to this effect was an acclaimed 1968 essay, “The Tragedy of the Commons,” by biologist Garrett Hardin. Hardin argued that people who share land as a commons will inevitably overexploit it. He cited the archetype of a common pasture to which anyone may add more livestock for grazing without restriction. In such circumstances, when individual farmers can reap private benefits from the commons without regard for its overall “carrying capacity,” a shared resource will be overexploited and fall into ruin, said Hardin. Hence, the “tragedy of the commons.”

The only solution to this tragedy, according to many economists, is to assign private property rights in land. Unlike commoners or government, it is argued, private landowners have the necessary incentives to take care of the land and make worthwhile investments in it. To support this general conclusion, neoclassical economists often cite “prisoner’s dilemma” game experiments that demonstrate the difficulties of getting individuals to cooperate to solve shared problems. In his influential book, *The Logic of Collective Action* (1965), economist Mancur Olson argued that “rational, self-interested individuals will not act to achieve their common or group interests” (p. 2). Drawing upon such analyses, a generation of economists and policy experts has denigrated common ownership of land as impractical.

Many critics, however, have challenged the tragedy of the commons narrative and prisoner’s dilemma experiments as unrealistic representations of real-world circumstances. They point out that social trust and communication are usually present in actual communities, and that these capacities can help groups overcome barriers to organizing collective-action solutions.

It has also been pointed out that the tragedy scenario that Hardin described is not, in fact, a commons, but rather a regime of unregulated open access. The land is “nonproperty” in the sense that no one has a recognized right to possess the land. There are no resource boundaries or governance rules, and anyone can appropriate whatever he or she wishes.

A commons, by contrast, is a system of governance and shared property rights for controlling access to and use of a resource. Successful commons generally have well-defined boundaries, for example, and rules that are well understood by identifiable participants in the commons.
The governance rules may be informal and implicit, and embodied in social traditions and norms, or they may be explicit and formally codified in law. In either case, there is a shared social understanding about who has rights to use the land's resources and under what terms.

A commons regime depends critically upon socially enforced cooperation and the exclusion of outsiders. It also requires the ability to identify and punish “free riders” who try to use more than their allotted share of the land's resources. With sufficient transparency in the commons, participants are able to prevent cheaters from taking more of the resource than they are entitled to under the social compact.

Collective management of land can have environmental advantages because it is more likely to treat the land as an organic ecosystem rather than a fungible commodity. A system of private property might divide the land into a collection of parcels, for example, perhaps resulting in the over-harvesting of timber in one plot of land that then leads to soil erosion or habitat destruction in an adjacent plot. But when commoners manage land holistically as an intact ecosystem, any abuse or overexploitation by individual users is likely to be identified and controlled.

Especially in poorer communities, collective management of lands can offer economic advantages. Villages and regional governments may find it expensive to maintain a system of courts, land titles, and private attorneys to manage individual property rights, and even fencing may be prohibitively expensive. Social rules and norms can serve as less expensive substitutes.

Others argue, however, that the lack of clear property rights in land is precisely what prevents poor people in developing countries from improving their economic lot. If peasants were more able to obtain clear and enforceable title in their land, for example, they would be able to use their land as collateral and participate more effectively in the market economy. Hernando de Soto makes this argument in his book The Mysteries of Capital (2000).

It is a mistake to regard systems of common land and private property as totally distinct and mutually exclusive. Private landowners are frequently restricted in the use of their lands by zoning ordinances, access easements, environmental laws, and other expressions of public needs and values. Conversely, unless a piece of land is managed communally, even commons can accommodate a certain measure of individual autonomy.

Ultimately, however, there is a fundamental, unbridgeable difference between a commons and a system of private property rights. In the latter, a person may sell and transfer individual ownership rights for cash. In a commons, by contrast, one cannot own the land as an individual nor alienate usage rights for commercial purposes. Usage rights are wrapped up in a web of particular social relationships, and cannot be bought and sold.

**COMMON MARKET, THE**

The term *common market* has multiple connotations in the European Union (EU). It is a term that was once used as a synonym for the European Economic Community (EEC), one of the organizations that evolved into the European Union. It is also a term that refers to the market integration of the participating states within the EU. In this respect the terms *single market*, *internal market*, or *single European market* are now more widely used.

Following the end of World War II a central goal of politicians in Western Europe was the maintenance of peace, and particularly the desire to ensure that Germany would no longer threaten this peace. Of critical importance here were the views of Jean Monnet, a French civil servant. Monnet believed that the best way to secure lasting peace between France and Germany was by institutionalizing cooperation between the states. This plan led to the creation of an organization that linked the coal and steel industries and markets of France, West Germany, Italy, the Netherlands, Belgium, and Luxembourg.
Monnet also believed that integration between France and Germany, and other states that were willing to participate, would not stop at coal and steel but would spill over into other sectors. This proved to be the case when the original six member states signed the Treaty of Rome in 1957 and created the EEC.

A central element of the Treaty of Rome was the common market, which remains one of the major components of the EU. The common market aimed to link the economies of the participating states by creating a customs union (that is, removing internal tariff barriers and creating a common external tariff for goods coming from outside the common market), by approximating economic policies, and by allowing the free movement of people, goods, services, and capital inside the participating states.

The customs union was put in place by 1968 but the other elements of the common market have proved to be more contentious and slower in developing. The members of the EU made a renewed commitment to the creation of a common market in 1986 when they signed the Single European Act (SEA). The centerpiece of the SEA was a commitment to remove all barriers to the free movement of people, goods, services, and capital by the target date of December 31, 1992. As in the case of the earlier Treaty of Rome, this target was not met and indeed considerable gaps remain in the common market. People cannot, for example, move freely around all of the twenty-seven EU member states in search of work. There has, nevertheless, been remarkable progress toward the completion of the common market, especially when compared to the situation in 1950. In the 2000s, the European Union has a highly integrated economic market that contains more than 450 million consumers. It is a powerful trading bloc and many non-European businesses adjust their products or working patterns in order to comply with economic regulations established within the EU.

COMMONWEALTH, THE

Commonwealth is a term (in Latin, res publica) with a rich and varied usage. It literally means the wealth or well-being of a public or whole body of people and sometimes implies a specific form of government. In the English language it was much used from the sixteenth century onwards, by Shakespeare for example. In the seventeenth century it was the name for England’s government, from the overthrow of King Charles I in 1649 until the abdication of Richard Cromwell in 1659. It is also part of the official names for a few U.S. states and, since 1901, for Australia. The term also is used sometimes for a community or organization with shared interests, as in the phrase “the commonwealth of learning.”

The principal and best-known contemporary use of the term is in relation to the more than fifty states that are members of what is today known simply as “the Commonwealth,” which evolved out of what was earlier known as “the British Commonwealth.” This Commonwealth as it is today emerged over decades out of the erstwhile British Empire and showed a considerable ability to modify, adapt, and reinvent itself. Britain initially ran the Commonwealth in tandem with the so-called dominions of Canada, Australia, New Zealand, South Africa, and, from 1921 to 1949, Ireland. Although it is a diplomatic ensemble, the Commonwealth has never been a clear cut economic or trade unit. While there was considerable overlap, the sterling area of the 1930s to the 1970s, made up of countries that used the pound sterling or pegged their currency to it, was never exactly coterminous with the Commonwealth.

By joining the Commonwealth in the late 1990s, India, Pakistan, and Ceylon (from 1972 Sri Lanka) turned membership from a white man’s club into a postimperial multiracial association. In the late twentieth century, decolonization and anticolonial movements, including opposition to South Africa’s apartheid policies, provided dynamism and led to expanding membership. In 1949 there were eight members; by 1965 when the Commonwealth Secretariat was launched (as a servicing bureaucracy for the whole Commonwealth), there were twenty-one members; by 2006 there were fifty-three members, of whom over half were small states with populations of less than 1.5 million each (many had much smaller populations, numbered merely in tens of thousands).

Today, the Commonwealth has an extensive range of special associations amounting to over one hundred non-governmental organizations. Its two most publicized activities are the biennial Heads of Government Meetings (colloquially known by the acronym CHOGM) and the Commonwealth’s Games held every fourth year. Over the
past century there has been a very extensive literature of books, journals, and pamphlets devoted to the Commonwealth’s characteristics, achievements, and shortcomings.

In addition to the commonwealth discussed above, there is another that attracts little publicity: the Commonwealth of Independent States (CIS). The CIS was founded on December 8, 1991, in Vistuti, capital for the Belarussian government, as a community of independent states that proclaimed itself the successor to the Union of Soviet Socialist Republics in some aspects of international law and affairs. The member states are the founders, Russia, Belarus, and Ukraine, plus nine subsequent adherents: Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Turkmenistan, and Uzbekistan.

COMMUNALISM
Communalism is the name for sets of social movements and theories (religious, social, and political). People usually live in communities, the exceptions being a few hermits, more slaves, and many more city dwellers (in the Roman Empire and in modern advanced societies). The city dwellers who live in society but not in community require the distinction between community and society. In parallel to this, Georg F. W. Hegel (1770–1831) and more explicitly Ferdinand Tönnies (1855–1936) offered the distinction between culture and civilization, observing that (the older) community lives by local custom and (the newer) society obeys the law of the land that Hegel sneered at, calling the equality that it supports “merely formal.” Hegel and Tönnies tacitly advocated the return to communal life, alleging that strife and alienation are lesser there and culture is more integrated; the basis of culture is religion, whereas the basis of civilization is (scientific) technology.

The original communalist movement was Talmudic Judaism. It underwent deep reform after the abortive Bar Kokhba revolt (132–135 CE). Unable to endorse or reject the Roman cruel peace (Pax Romana), the Talmudic sages decided to sit it out and act, meanwhile, as the bearers of morals and enlightenment. To that end they geared Jewish law to utterly decentralized communal living rooted in education and family life, with each community politically, morally, and religiously autonomous; each rabbi is a supreme doctrinal authority functioning as a teacher of the community. This traditional description misses the major specific characteristic of Jewish communal theory and practice, which is that the diverse autonomous communities were linked in a powerful informal grassroots cultural network (-called “Knesset Israel,” in allusion to its role as a surrogate parliament).

Hardly noticed, this decentralized network was emulated in great variations in medieval Europe, with communities controlled by the church and fused under secular rulers, and in traditional Islam of the caliphate (with the caliph as both religious and lay ruler) run as a network. For centuries it was the social institution nearest to democracy, making the traditional West distinctive and amenable to its later, spectacular changes. The lesser authority of the Protestant minister—as compared to that of the Catholic priest—strengthened communal networks; these have survived and in the early twenty-first century are misnamed “family values” and promoted by some neoconservatives and by religious communalist philosophers, including Alastair MacIntyre and Charles Taylor, both Catholics. Most contemporary communalists, however, deem them obsolete.

Modernity began with the individualism of the Enlightenment movement that found its expression chiefly in the advocacy of individual reasoning and thus of science as superior to faith, as well as in the view that the free choice of citizens is the only possible legitimate source for the right of governments to rule. (This is the doctrine of the social contract.) The Enlightenment movement ignored the community as unproblematic and outmoded. The Romantic reaction to it preferred the community over the polity, and custom over law. In efforts to compromise between the two movements, utopian communities were repeatedly founded. Their standards were intolerably high and so they failed, although always while raising the standards of their societies, thereby making significant contributions to the modern lifestyle. They gave way to the new welfare state and the newer communalist efforts to bring society and community together. Only neoconservatives advocate the return of welfare services to the community, and even they admit implicitly that this return cannot be total.

Philosophically, as the Enlightenment movement anchored everything social in the individual, its problem was: How does society emerge out of a cluster of individuals? This question is unanswerable, said the Romantic philosophers, because the pre-social individual is fictional. They, on the contrary, considered society an organism and the individual a limb with no independent existence. This
is empirically more tenable but not enough, and it is morally useless. A search began for an alternative, a via media and a modus vivendi. Georg Simmel (1858–1918) and Karl Popper (1902–1994) assumed the existence of both individual and society. Gustav Landauer (1870-1919) and Martin Buber (1878–1965) deviated less from traditional philosophy. Buber declared that both individual and society owe their existence to the individual’s essential disposition for interpersonal relations; this disposition is (theoretically) prior to both.

This centrality of the disposition for interpersonal relations led to communalism as a new view of society that is more visionary than explanatory. Buber viewed the community as a network of individuals tied in a more-or-less face-to-face relation and the nation (more specifically, the culture) as a network of such communities. He played down the difference between society and community as he envisioned (in his 1946 book, Paths in Utopia) an urban society comprising a conglomerate of cooperative communes. He did not view all communities as communes or all communes as living in kibbutz style, but unlike the older utopians he did not elaborate. He considered the alienation of the modern urban individual a serious challenge, and communalism as its answer. The question is, where does politics enter the picture? Buber suggested that this question is less important than another question: How can politics be tamed so as to prevent it from destroying communal life. He found this question more practical than theoretical (unlike Popper who developed democratic theory around it). So he invested in communitarian political activity.

The new communalists, with Amitai Etzioni (b. 1929) as their leader, aim at filling this theoretical gap. Etzioni founded the George Washington University Institute for Communitarian Policy Studies (and continues to serve as its director) as well as the Communitarian Network (1990). His communitarian principle is meant to be applicable to national and even international politics. To a large extent it is simply the applications of (updated) agreeable liberal attitudes to diverse political problems with an accent on individual responsibility. To the extent that there is a new principle here, it is this: Both society and community are essential for a quality life, and so political concerns should include attention to communal concerns and vice versa. This is not a proposal to unite community and polity but to increase their cooperation. The recent development of nongovernmental organizations (NGOs) and their contributions to both community and polity alike is a remarkable example.

The expected development of former colonies into liberal nation-states was halted because colonialists had encouraged community life as a poor substitute for national independence. As after independence different communities within one country struggle to maintain their relative independence there, the overall result is inter-communal strife and thus damage to national liberty. The proper move should be towards western-style pluralist nations with a heightened sense of community. This is easier said than done.

COMMUNICATION

Communication is inseparable from social and behavioral activities; as a consequence it has become an integral part of research and discussion in the social sciences. Mass media and rhetoric thus closely relate to political science, while semantics and rhetoric enrich the study of law. Perception, the tool used to make sense of messages, generates much discussion in psychology and psychiatry and both areas benefit from careful communication. As the psychotherapist Carl Rogers noted in On Becoming a Person (1961), “The whole task of psychotherapy is the task of dealing with a failure in communication” (p. 330). Sociology, in part the study of human interactions, benefits greatly from an understanding of communication’s roles in those interactions.

Sociology focuses on groups while psychology focuses mainly on the individual. However, they blend in social psychology, and probably the greatest social science focus on communication has been in social psychology. This blended discipline studies the psychological basis of people’s
relationships with one another. Social psychologists posit that people have few if any solely individual attributes.

In the study of interaction patterns among people and methods of influencing people, much of the work done by these scholars naturally relates to communication. In seeking to determine these patterns, social psychologists follow the work of Erving Goffman as they speak of the self, a collection of attributes, social identity, self-concept, and appearance. Interpersonal communication is affected by where a person is in the social structure as well as by the influence of others.

Relative to communication, pioneering social psychologists like Robert Bales (1950) explored interactions in small groups, while Solomon Asch (1955) detailed the impact social factors have on perception. Michael Argyle looked at patterns of social relationships across social class, while more recently Deborah Tannen (1990) examined the social characteristics of gender and gender's effects on interactions.

Social psychological research in communication owes a heavy debt to scholars like Paul Ekman, W. V. Friesen, and Raymond Birdwhistell who focused on the complex patterns nonverbal communication takes. Their research has also explored possible commonalities in meaning of nonverbal signals within and across cultures.

While people engage in communication almost unconsciously, it remains a complex subject which defies simple explanations and calls for continued research. Overall, the insights into human interaction developed following social psychology research have led to numerous practical applications, especially in the business world.

COMMUNICATION DEFINED
In its simplest form, the term communication refers to the process by which one person transmits information (new knowledge) to another person (or persons). A number of communication models exist, but common elements delineated by Claude Shannon and Warren Weaver (1949) link them: a sender, a receiver, a channel, the message itself, and some effect or impact resulting from the message exchange (including feedback).

Feedback, a crucial part of the communication process, represents the response to a received message (not necessarily to the message intended to be sent, but to its interpretation). While an element in the overall process, feedback's transmission duplicates the communication process it responds to, and thus involves sending and receiving, as well as media, and it can be impacted by communication barriers. Feedback, in turn, may lead to a response. Mechanistic approaches like the classic Shannon-Weaver model are appealing in their simplicity in explaining the communication process, but they do not reflect communication's complexity, especially in terms of perception (which reflects the application of past events as well as the context in which the message is being received). Perception, in fact, accounts for much of the complexity of the communication process.

PERCEPTION
The sender (often) and the receiver always use perception to make sense of the message passing in the communication interchange. The perceiver processes the message's signs, its tangible factors, to determine the meaning (intended or not intended). These signs include what is seen, heard, felt, tasted, or smelled. The receiver then uses the mental filters of past experience to sort the signs and apply the meanings gained from similar past sensory experiences. Meaning derives from that past experience as one makes sense of the present through that experience.

The sender of a message may intend one meaning for what is sent, but the experiences the sender draws on in assigning that intended meaning may be only partly shared with the receiver. The meaning derived is thus imperfectly shared between the parties if at all. Few (if any) messages represent a pure transfer of identical meaning. While spoken communication is usually interpreted by the receiver almost immediately and often in a close spatial context (mass media and telephonic messages are obvious spatial exceptions), written communication is likely to be received and interpreted after some time lag and at a spatial distance. The context in which it is received will most likely have changed through time, and these changes may affect the perception of the message. Additionally, in any communication interchange, the very experience of receiving the message alters the receiver's perception and will affect the next message that comes through. Perception is a dynamic, ongoing process, as communication theorist C. Glenn Pearce noted, and the sender and receiver's own perceptual filters change constantly as a result of the interaction.

COMMUNICATION AND INTENT
Even when unintentional, communication can still occur. A hapless job interviewee might make a poor first impression with unpolished shoes, a weak handshake, or slouching posture (elements of nonverbal communication). The interviewee likely intends to signal competence, but the outcome differs from that intended. Of course, much communication is intentional. The more effective sender learns skills to help achieve the intended results, but perception is still a major factor. Yet, if what one applies to interpret a message varies widely from the sender's intent, common meaning may not be achieved, especially in communication between cultures.
COMMUNICATION BARRIERS
Communication barriers, elements external to the message, also complicate the process. Barriers can be as simple as physical noise or can derive from intrapersonal, interpersonal and even organizational sources. These barriers are inevitable and communicators (senders and receivers) need to work to overcome them (where possible) to enhance communication effectiveness. Steven Golen’s (1990) research into communication barriers has revealed their myriad sources and the challenges communicators face in overcoming them.

Some barriers are easier to overcome. Physical noise, for example, can be overcome by isolation or simple muting. However, the intrapersonal barrier of defensiveness is more challenging in calling for one's self-awareness and empathy. An organizational barrier like the serial transmission effect (the tendency for messages to change in passing through an organization’s levels) calls for objective message management skills.

The goal of a message is to transmit information, knowledge the receiver does not already know. Shannon noted that the entropy rate, the amount of information the sender wishes to transmit, cannot exceed the channel capacity without creating uncorrectable transmission errors. Keeping the sender's entropy rate below channel capacity greatly reduces errors and enhances information transfer and helps combat communication barriers. Redundancy is another useful element in communication.

REDUNDANCY
Communication systems naturally utilize redundancy to help combat problems with communication barriers and perceptual differences. Redundancy, predictability built into the message to help insure comprehension, backs up the message. While redundancy can seem to be mechanical, senders use it naturally without even thinking. It derives largely from repetition, exemplification, orthography, grammar, syntax, and format. David Gibson and Barbara Mendleson (1984) explored the dynamics of redundancy and showed the linking of information and probability theories to semantics.

Messages sharing a common grammar, syntax, and orthography are likely to be more redundant and thus help ensure the receiver shares much of the sender’s intended meaning. When redundancy is minimal, additional communication barriers can arise. Redundancy can be overused, of course, particularly in terms of exemplification or repetition.

NONVERBAL COMMUNICATION
Another source of information in communication exchanges is nonverbal communication. Although less precise than formal language, it is a very significant source of information in most interpersonal exchanges and often contains more information than in the spoken element of the message. A message’s nonverbal elements include all the sources of information apart from the words themselves. Gestures, posture, tone, pitch, message duration, and intensity all add nuances to the message, and complexity. This latter is particularly the case in those cases where the nonverbal contradict the other signals. Social psychologists, notably Ekman and Friesen (1974), have closely studied nonverbal communication not just as a source of information in a message, but as a source of nonverbal leakage of deception as well.

The sender controls many nonverbal elements, of course, but other elements over which the sender has little or no control can be sources of meaning in communication. Thus one's age, race, gender, height, hair color, and even physical attractiveness can represent encoded signals for the receiver to interpret. Here intent is lacking, but the nonverbal signals still play an important role.

Whatever the source of the signs giving messages meaning, communication is a relevant part of the social sciences. While communication seems deceptively simple at first glance, its underlying complexity richly repays careful study both in terms of more effectively preparing (and understanding messages) and in terms of understanding and improving the human interactions in which communication takes place.

COMMUNISM

Communism, simply put, is a socioeconomic political doctrine that advocates a classless and stateless society wherein there is collective ownership and control of property and all means of production. The term communism, however, means different things to differently situated people and as such might be a function of time and place. Some people associate the term with liberation from colonialism or other forms of oppression and a defense of lower-class working-class interests, while others equate it with an idealized state, a political movement, or a way of life. Still others regard it as a rejection of traditional European and North American sociopolitical values. Despite such variations in meaning, embedded in each is the notion of change. Change, however, is not always organic but is, instead, often orchestrated by those overseeing societal transformation.

A core aspect of the practical application of communism, then, has been a strong centralization of decision-making and state planning, especially in the economic sector. State planning, as practiced in the Soviet Union, Eastern Europe, and the Third World, coupled with the need to effectively silence opposition to the imposition of the Communist political and economic order, has often hinged on the effective use of authoritarian practices and single-party rule. This does not mean, however, that authoritarianism is a necessary and sufficient condition for the flourishing of Communist practices. Moreover all political systems encompass a certain degree of authoritarianism and centralization.

DEVELOPMENT OF THE THEORY OF COMMUNISM

The notion of communism dates back to ancient Greece, where it was associated with a myth concerning the golden age of humanity, when society lived in full harmony. Plato (in The Republic) and other ancient political theorists advocated a kind of communal living, which is viewed as a form of communism. It is Karl Marx, however, with the assistance of Friedrich Engels, who is most often credited with providing the most popularized expression of communism. As expressed in the Communist Manifesto (1848), their theory of communism is underpinned by antecedent philosophical arguments about the history of humankind that include the dialectical and historical materialism of Georg Hegel and Ludwig Feuerbach and others who expressed views on socialism and communism prior to and during the beginning of the European socialist movements of the 1840s. Marx’s view of communism was influenced by a long and established tradition of “utopian” socialists, but he embraced a “scientific” approach that added a new twist to existing thought. Moreover Marx and Engels referred to communism as scientific socialism.

Socialism, as a political theory, developed during the European working-class rebellions, when the predicament of workers was viewed against the backdrop of the prevailing liberal logic of the day. Its point of departure, according to the political scientist Alfred Meyer, was the assertion that the ideals associated with the American and French Revolutions—namely liberty, equality, fraternity, and the right to a human existence—had been aborted. Thus the promise of these revolutions could be fulfilled only when political rights were consonant with social and economic equality, which necessitated wiping out the differences between rich and poor. Drawing from this and earlier philosophical arguments and movements, Marx and Engels embarked on an attempt to further develop the theory.

Marx viewed communism as the highest stage of socialism and the history of humankind as imbued with struggles between the capitalist class (the owners of capital) and the working class (proletariat). His theory, as articulated in the Communist Manifesto, viewed the movement of society toward communism as a scientific fact. This view holds that inherent contradictions of capitalism paved the road to revolution, which would be fueled in part by class consciousness. According to Marx, a socialist society, ruled by the working class, would emerge out of
this revolution. Eventually the socialist society would evolve into communism—a classless society free of exploitation, poverty, and government coercion. Although Marx continued to view economic classes as engines for moving society to higher stages of historical development, his later works encompassed more detailed and refined arguments, including an emphasis on the polarization of the impoverished working class. The emergence of the Communist society envisioned by Marx has never come into fruition, and this failure has facilitated the rise of other schools of communism. Nevertheless, the terms communism, socialism, Marxism, and Marxism-Leninism are often used interchangeably.

The school of communism associated with Vladimir Lenin, like that associated with Marx, is informed by precursor philosophies and is grounded in the Russian reality of the 1900s. Lenin’s theoretical interpretations and practical application of doctrines espoused by Marx also contributed to the development of communism. Whereas Marx predicted that the proletarian revolution would occur in capitalist society, Lenin believed that revolution could occur in precapitalist colonial societies, no matter how primitive. His theory also holds that imperialism is the highest stage of monopoly capitalism, which results from the contradictions of capitalism that fuel the search for foreign outlets for surplus capital and production. The “dictatorship of the proletariat” would be implemented by a small, dedicated elite of the Communist Party, who would lead the revolution.

Lenin’s interpretation of Marxist doctrines was shaped by events associated with the Russian Revolution of 1917, which convinced him that a successful revolution in Russia could not occur as a spontaneous popular uprising. He concluded that the revolution would have to be the work of a well-organized group of professional revolutionaries. Thus he pulled together a group comprised of discontented intellectuals, workers, and peasants of different nationalities who happened to be in the right place at the right time to seize the levers of state control in Russia.

RISE OF COMMUNIST STATES

Although Marxist communism was implemented in other areas of the world outside the Soviet Union, its expansion did not occur until after World War II (1939–1945). Prior to that time many Communist parties existed in various countries, though none held the reins of governmental power. Communism, as developed by Lenin, facilitated the spread of Communist states in Eastern Europe and other parts of the world. In fact underdeveloped societies facing a crisis of modernization implemented Marxism or Marxism-Leninism at a greater rate than did capitalist societies. Thus it can be argued that Marxism-Leninism had a greater impact on the world than any other modern philosophy during the twentieth century.

According to Meyer, Third World Marxism originated in Asia in the early 1920s and gradually spread to Africa, Latin America, and other areas that were fighting traces of colonialism. This form of Marxism had the Leninist theory of imperialism as its base. The majority of states, however, were brought into the Communist sphere after World War II, fueled by the cold war rivalry between the United States and the Soviet Union. Soviet communism was appealing because of its focus on expunging imperialist exploitation and domination from Third World states. And though the Communist Party of the Soviet Union had developed into an exportable model of success, communism, as practiced in the third world, took on a variety of forms. The Soviet model, like earlier concepts of Marxism, was altered by its application in other countries. Third world (non-Western) communism took on characteristic features of the Chinese brand of communism rather than that of the Soviet Union.

There were also conscious attempts to break free of the Soviet model of communism in Eastern Europe. The first successful attempt occurred in Yugoslavia, where the leader of the Communist Party, Josef Broz Tito, did not owe his position to Josef Stalin. James Ozinga, in *Communism: The Story of the Idea and Its Implementation* (1991), notes that Yugoslavia became a middle ground between Soviet communism and the West, owing to Tito's abandonment of rural collectivization and implementation of free enterprise and real elections, among other non-Soviet practices. The second major attempt to loosen Soviet control occurred in Hungary in 1956, followed by Poland. A third attempt surfaced twelve years later in Czechoslovakia. Efforts to remove tight Soviet control began with these nations’ Communist parties and represented an expressed desire for greater liberty and a more national approach to the socialist goal (see Lerner 1993).

Communism officially came to power throughout China in 1949, following the defeat of the Nationalist (Kuomintang) forces by the Red Army. The early Chinese Communist ideology was heavily influenced by the thoughts of Mao Zedong, but Marxism-Leninism provided the theoretical foundation for the Chinese Communist ideology and served as the guiding principle for the party and state. Mao’s thoughts provided the principles for practical application.

Chinese communism, as articulated by Mao Zedong, viewed the peasantry as the class that had to be mobilized for the revolution. Unlike Lenin’s enlightened leadership elite, Mao advocated use of the peasantry as a major rather than a secondary force in the revolution. This meant a reliance on a rural-based group, rather than an urban proletariat, to bring about a socialist transformation. Suzanne
Ogden, a Northeastern University professor who has written often on China, notes that an orthodox Marxist-led revolution against urban capitalism made no sense in China because few workers had been exploited by the capitalist class. Mao also believed that putting revolutionary theory into practice was critically significant in guiding expected social contradictions in the right direction. Thus dialectical confrontation did not end with the triumph of the political revolution but continued into socialism and communism, according to Mao’s theory. Jiwei Ci argues in *Dialectic of the Chinese Revolution* (1994) that the establishment of the Communist regime in 1949 marked the successful acquisition of Marxism as cultural self-identity, and China’s possession of it became monopolistic after its ideological break with the Soviet Union in 1960.

Similarly in Cuba traditional Communist doctrine (Soviet communism) was revised to reflect Cuba’s historical reality. During Fidel Castro’s 26th of July movement, the Communist Party played a secondary role. José Martí, not Marx, symbolized Cuban independence from Spain and inspired dramatic change. It was his ideas that were embraced by Castro. Thus the movement began with Castro and a group of dedicated nationalists. After the movement crushed the government forces, the new regime immediately committed to Marxism-Leninism and to Soviet patronage. This patronage was born more out of economic necessity than ideological congruence. By 1963 Castro realized that orthodox Communists were a threat to Cuba’s contact with regional revolutionary regimes, which compelled him to reinvigorate the revolutionary will. Thus his Communist Party exercised doctrinal independence and was charismatic rather than bureaucratic.

A cursory historical examination of Communist states, both in Eastern Europe and in the developing world, reveals a wide range of differences in ideologies and approaches to the practical application of communism. It is clear that the revolution, as envisioned by Marx, never swept Communists into power in any country. Historical evidence indicates that internal conflicts between the petit bourgeois and the ruling class, external relations, and other intervening variables had as much if not more relevance for the implementation and the nature of the Communist rule in Africa, Asia, and Latin America than did working-class consciousness and commitments to the Marxist-Leninist philosophy per se.

Many of the Communist states that developed in tandem with the cold war politics of the United States and the Soviet Union took on the character of the individuals who came to power rather than strict adherence to the Soviet model. The “revolutionaries” turned Communist state leaders understood the nature of their societies and knew exactly when to infuse their articulation of Communist doctrine with interpretations that were more relevant to national realities. One must then consider the intersection of historical events and personality as important variables in explaining variations in Communist states. Obviously different interpretations make it almost impossible to speak in terms of the “theory of communism.”

**THE COLLAPSE OF COMMUNIST STATES**

Mikhail Gorbachev’s rise to power, which precipitated the collapse of the Soviet Union in 1991, contributed to the demise of Communist Party rule in Eastern Europe and other parts of the world. Gorbachev believed that a Soviet foreign policy based on military might was a luxury that could no longer be afforded. Thus he reversed the Brezhnev Doctrine, which for years had protected unpopular Communist regimes from their population. His message was simple: the Soviet Union would no longer intervene to save faltering Communist regimes. This, coupled with events in 1989 and 1990, signaled changes that were about to occur in the Soviet bloc. In the Soviet Union the constitutional monopoly of the Communist Party was repealed, and power gradually shifted to new, mostly elected institutions of government, while opposition parties in Eastern Europe defeated Communist candidates in many local and national elections in 1990.

By the early 1990s the only states in which communism was firmly entrenched were in East Asia and a few other regions, notably China and Cuba. The collapse of the Soviet Union in 1991 rendered the United States the sole superpower, which had enormous implications for the collapse of Communist regimes in other parts of the world. By the mid- to late 1990s more and more Third World Marxist-Leninist regimes were replaced by regimes willing to play to the U.S. global political and economic agenda. This by no means resulted in the complete demise of Communist regimes, however, but it did motivate a substantial number of old-guard Communist leaders to present themselves as reformed or rehabilitated advocates for a different kind of democratic rule and free enterprise. In 2007, in parts of the former Soviet Union, Eastern Europe, and other regions of the world, post-Communist states are led by former Communists who are authoritarian, dictatorial, and cloaked in corruption. This could create an environment conducive to the return of the Communist state.

Communism, Primitive

Primitive communism is the earliest mode of production in Marxist thought. Karl Marx proposed that Asiatic, ancient, feudal, and bourgeois modes of production are epochs that mark the transitions of societies. Also, the changes in the mode of production from primitive communism through slavery, feudalism, capitalism, and socialism to communism are due to the method of dialectic, and the theory of materialism. The dialectic method involves the meeting of extreme forces that merge into synthesis. At the early state of primitive communism, primitive forms of hunting gave way to primitive forms of agriculture and cattle-rearing. Also, dialectic changes of the matriarchate to the patriarchate types were recognized. In the matriarchate form, women played a dominant role in production under primitive agriculture, while the men roamed the forest after game. In the patriarchate form, men played the dominant role in the hunting and cattle-rearing stages because they were efficient with a bow, arrows, spears, and lasso. The actual process of analyzing the changes of modes of production follows a materialistic theory. Through evolution, human beings developed a consciousness that became sensitized to material change. In primitive societies, production was in the simple form of adapting to nature. Land was cultivated before it was divided, and the consciousness was communal. As production processes changed, envisaging private ownership, people’s consciousness changed in that direction.

One purpose of studying primitive communism is to understand how the three major classes—wage-laborers, capitalists, and landlords—have developed under capitalism. During primitive communism property belonged to the community and labor owned all the product of its labor in the absence of capital- and land-owning classes. If one tribe was conquered by another, the conquered tribe became propertyless, as was the case with slavery and serfdom. A tribe and its property formed a sort of unity that originated from the mode of production where individuals related to one another and to nature. The object of production was to reproduce the producer. For Marx, production is not possible without capital. In primitive communism capital could be just the hands of a hunter-gatherer. Strictly speaking, capital is specific to the bourgeois mode of production. Tools are not capital outside of capitalism. And production is not possible without human labor, not tools, which are a product of human labor and natural resources.

Marx wrote, “In early communal societies in which primitive communism prevailed, and even in the ancient communal town, it was this communal society itself with its conditions which appeared as the basis of production, and its reproduction appeared as its ultimate purpose” (Marx 1967b, p. 831). Primitive communism dissolved when the mode of production changed.

In specific forms of primitive communism, one finds two major forms of unity between labor and production conditions. This unity was observed in Asiatic communal systems and in small-scale agriculture (Rosdolsky 1977, p. 273). Marx appraised the small and ancient Indian community as possessing common ownership of land, blending agriculture and handicraft, and possessing an invariable form of division of labor. As the market was

BIBLIOGRAPHY

Kathie Stromile Golden
unchanging, the division of labor could not evolve to, for instance, the manufacturing level.

If population increases, a new community is formed on vacant land. Production is governed by tradition, rather than by command or markets. According to Marx, "this simplicity supplies the key to the secret of the unchangeableness of Asiatic societies" (Marx [1867] 1967a, pp. 357–358).

For Marx, logical methods based on observation and deduction can lead one to "primary equations" that point to the history of capitalism (Marx [1894] 1967b, pp. 460–461). It starts “… from simple relations, such as labor, division of labor, need, exchange value, to the level of the state, exchange between nations and the world market” (Marx [1857] 1973, pp. 100–101). These simple relations explain how production, distribution, and consumption are conducted within all societies. These activities are in turn subsumed under relations of production and forces of production. A fact of primitive communism is that although “the categories of bourgeois economies possess a truth for all other forms of society…” They contain them in a developed, or stunted, or caricatured form, etc., but always with an essential difference” (Marx [1857] 1973, p. 106).

Marx’s writings on primitive communism occupied his mind all his life. The 1880–1882 Ethnological Notebooks containing his study of the ethnologists Lewis H. Morgan (1818–1881), John Phear, Henry Maine, and John Lubbock remain his last view on the subject. Morgan sourced property rights in primitive societies to personal relationships and Maine to impersonal forces, but to Marx the source is from the collective. Marx basically accepted Morgan’s view on the ethnology of primitive peoples. He studied primitive groups for the origin of civil society and the state and he traced the production mode from these primitive groups to modern society.

Further exposition of primitive communism was taken up by Friedrich Engels (1820–1895), based on the works of Morgan, whose materialistic conception of history was similar to Marx’s. Morgan discovered a kinship system among the Iroquois Indians that was common to all the aboriginal inhabitants of the United States. He found that the system was common to Asia, and to some extent to Africa and Australia. Morgan introduced the concepts of the matriarchate and patriarchate to characterize primitive communes. The order of primitive communes originated with the production of food, or subsistence needs. The human race has progressed from lower to higher forms to modern civilization as lower forms of savagery and barbarism have progressed to higher forms. The arts of subsistence advanced as inventions and instruments evolved. Property, government, and family progressed in this natural process. For instance, evolution bequeathed group marriage for savages, pairing marriage for primitive communes, and monogamy for civil societies. Morgan’s process paralleled Marx’s ideas expressed some forty years earlier.

COMMUNITARIANISM

Communitarianism is a political philosophy that often stands in opposition to the principles of liberalism. Communitarians theorize that the community is the most important element of a society or culture. As such, the stability of the community must be enhanced and protected. Within the public sphere, communitarians explicitly argue against individualistic and pragmatic liberalism, citing a loss of moral and civic orientation. Communitarians posit that true ideals in a democracy cannot survive without a cohering center. Some communitarians, such as Robert Spaemann and Alan Bloom, consider that individualistic legacies of Enlightenment thinking have led to the decline of community as a way of life by harming the ability of the moral imagination to find solutions to community problems such as poverty or discrimination. Communitarians such as Markate Daly advance the notion that community is a part of life. As such, every
individual is a member of a community and through this membership develops identities, relationships, and attachments with others; the members of a community express their values through their institutions and social needs. Those such as Amitai Etzioni criticize values of autonomy, natural rights, neutrality, universality, and individual interests in favor of values that emphasize traditions, common good, character, solidarity, social practices, and social responsibility. Communitarian goals bring about changes in habits, public policies, and morality that allow a community to work toward a future based on strong community goals and values.

Communitarians also posit that not all communities are moral. Communities that seek to destroy or diminish human life and property would not be allowed within the communitarian rubric. Rather, a true communitarian seeks stability and a community that flourishes. Democracy is seen as communitarian in that it joins community interests and institutions to bring about the will of the people.

Another common tenet of communitarianism is that loyalty is given to the community and group for the greater good of the community. As a political philosophy, resources for moral judgment and action are located in the established mores of the family, the workplace, and like rather than within the individual; as such, the point and purpose of individual lives is to serve institutional needs and goals rather than vice versa. This system needs persons who can commit themselves to collective behaviors.

Some communitarians theorize that community views should not be challenged. It is more important that community leadership reinforce and strengthen the status quo. For example, the communitarian journalist should reinforce information necessary to maintain community values.

Additionally, communitarian leadership focuses on attaining ideals and keeping the group together, thereby maintaining a hard-earned position in the social structure. The group provides a presentation of a united front possessing power or the illusion of power. Individual members gain self-confidence from merely belonging but also will lose some individual identity. The system is more basic than the rights of individual members, so concepts of justice or fairness are sometimes ignored in favor of preservation of the group. Further, to some communitarians, loyalty to the group transcends the cause of truth.

Within the political realm, the community is usually advancing a cause, thereby seeking strength in numbers. Often the group is formed because of misuse of individual rights in a particular area, creating an attitude of “us versus them.” Often the community remains together even after the goals for forming it are met. Additionally, the group has the ability to banish members who do not follow the rules of the community and individualist members who find a cause or a truth the group would rather not explore. Rules are set by the community, and often examination of the rules is not necessary. Because of a reluctance to examine rules, members are slow to develop their own moral reasoning and rely on the morality of the group.

Noted contemporary communitarians such as Alasdair MacIntyre find that the individualistic legacies of Enlightenment thinking have been “historically implicated in developments that have led to the decline of community as a way of life” (1984, p. 52). Amitai Etzioni celebrates these individuals who are committed to the community rather than to individual rights by stating that “communitarians are dedicated to working with our fellow citizens to bring about the changes in values, habits, and public policies that will allow us to do for society what the environmental movements seeks to do for nature: to safeguard and enhance our future” (1993, p. 3).

Philosopher Markate Daly (1994) believes it is essential that communitarianism become a way of life. In communitarian theory, philosophers assume that community is part of life; as such, every individual is a member of a community and through this develops identities, relationships, and attachments with others. The members of a community express their values through their institutions and social needs, tempered by kindness. She contrasts communitarian with liberal notions as, “instead of such values as individual interests, autonomy, universality, natural rights and neutrality, communitarian philosophy is framed in terms of the common good, social practices and traditions, character, solidarity and social responsibility” (Daly 1994, p. 17).

Jürgen Habermas (1990), a prominent continental philosopher, uses a system of communitarian philosophy in proposing a dialectic that must be open to the community. Within his system, all decisions, particularly problematic decisions, can be made by the collective. Each member who is competent to speak to the subject is given equal time and input into the decision process.

Wendell Berry (1990) reminds that not all communities are moral, and those communities set to destroy or diminish human life and property should not be considered communities. Clifford Christians, John P. Ferre, and P. Mark Fackler confirm Berry’s sentiments, stating that “because a moral community is a condition for personhood, a group is not ipso facto good, and no community can excuse inhumane behavior” (1993, p. 69). Berry and Christians are examples of communitarian thinkers who realize the need for a conception of individual good to balance the supreme good of community stability.

Communalism is a distinct political theory and political practice. It differs from communitarianism in many ways.
ways. It generally involves a group of individuals committed to communal living and common ownership. This commitment involves loyalty to the interests of the communal minority or ethnic group rather than to society as a whole. Some forms of communalism work toward abolishing the state, not seizing power but doing away with power and the particular power attached to the business model of capitalism. Often, religion is a driving force in communal living.

A commune is described as the basic living habitat for the communal organization. Most are serious about being self-sustaining in both consumption and production. This means that the group should own enough land to feed itself and have a specialized means of commerce. Examples of successful communal groups are the Hutterites, who were financially successful craftsmen and agriculturalists. Oneida, Amana, and in the twentieth century the Brüderhof are also examples of successful communes.

In practice, Friedrich Engels and Karl Marx wrote extensively about the ideals of communist living in general but sometimes specifically about the ideals of communal life. *Socialism: Utopian and Scientific*, a pamphlet originally published in 1880 by Engels (2006), delineates the notions of communalism and contrasts it with socialism. Their plan calls for a new society founded on quality of life rather than slavish work. However, it does not give a plan for the ideal community.

Often the term *utopia* is used in conjunction with communalism, moving the commune to a visionary or an ideally perfect state of society. Sir Thomas More’s *Utopia* ([1516] 2003) describes an imaginary island with the ideal social, legal, and political system. Humans can strive to create this within a community or globally in an effort to live more civilly. Sometimes utopian is used in a negative way to discredit ideas seen as impossible to realize.

**COMMUNITY ECONOMIC DEVELOPMENT**

Community economic development is a term for the processes of change generated through place-based economic activities that are controlled by, or at least oriented toward, local residents for their betterment (Gordon Nembhard 1999, p. 297). Community economic development strategies encompass a variety of community empowerment and business development approaches, such as political advocacy, constituency group organizing, entrepreneurship development, education, job training, and labor development (University of Illinois at Chicago Center for Urban Economic Development 1987). Economic activities include job creation, entrepreneurship and business development, housing development, the provision of financial services, and the development of capital markets.
Local economic development practices can be categorized into five general chronological and overlapping phases: state industrial recruitment (starting in the 1930s); political critiques, advocacy planning, and community focus (1960s); export orientation, labor market research and development, and equity strategies (1970s and 1980s); environmental sustainability and social justice (1980s); and privatization and regional integration (1990s) (see Fitzgerald and Leigh 2002, pp. 9–26). Scholars and practitioners, particularly starting in the 1960s, have honed the term community economic development to focus on grassroots activity that is local and indigenous. Such efforts are centered on people and a variety of stakeholders (residents, workers, business owners, policymakers, civic and political organizations, etc.). Community control and economic stability, independence, and prosperity are the goals.

Economic development models range from traditional private business/corporation-centered models to alternative community-based, cooperative, and employee-owned models (see Gordon Nembhard 1999). The corporation model uses strategies to retain or attract businesses to the community, as well as strategies to make the residents “good” employees for those businesses. Municipalities attract the businesses with tax incentives and abatements, subsidies, below-market loans, favorable zoning changes, utility cost reductions, infrastructure improvements, the establishment of commercial districts, and the designation of industrial parks and business incubators. Using traditional strategies, municipalities will also try to ensure corporations a relatively cheap and dependable labor force, even though many of these businesses hire few local residents.

Community-based and community-initiated development, in contrast, combines public, private, and nonprofit economic activities to increase residents’ and workers’ human, social, and cultural capital; to facilitate organizational, managerial, and microenterprise experiences in establishing and maintaining small local businesses that are owned and operated by residents (and tend to hire more residents); and to maintain affordable housing. These kinds of enterprises include consumer, producer, worker, and housing cooperatives; credit unions; democratic ESOPs (employee stock ownership plans) and other employee-owned businesses; community land trusts; community development financial institutions; community development corporations; nonprofit businesses (social entrepreneurship); and municipally owned companies (Gordon Nembhard 1999; Democracy Collaborative 2005). Debates about contending strategies often revolve around false tradeoffs between pollution and jobs, education and recreation, livable wages versus minimum wages, unionization and corporate growth, cooperative ownership and private property, and affordable housing and prosperous real-estate markets.

Community economic development focuses on the neighborhood and municipality level, as separate from regional, state, federal, and international economic activity. Interactions are thus more intimate and intertwined, and the range of activities are more oriented toward and affected by place. A focus on community economic development often elevates microlevel activity and small-scale community-initiated projects as strategies to reach marginal and underserved populations. However, the effectiveness can be limited. Sometimes solutions to economic problems require broader participation and enhanced or increased resources pooled at the regional, state, or federal levels. On the other hand, higher-level policies can also undermine progressive local policies, such as national or international trade rules that do not recognize, or actually invalidate, local environmental or labor standards and tax laws. Corporate globalization increasingly undermines many aspects of community economic development by removing resources and control from local communities (Blakely and Bradshaw 2002; Gordon Nembhard 1999). Local strategies, particularly asset-based strategies that help residents develop and own a variety of wealth-producing assets, have become increasingly popular in the face of persistent poverty and globalization. Community economic development strategies anchor capital and keep the benefits circulating among those who produce it, serve it, and need it.

BIBLIOGRAPHY
COMMUNITY POWER STUDIES

Power is a contested concept, with little agreement about what exactly to study or how to go about it. It is also a concept that belongs to many disciplines—political science, sociology, and psychology all accord it special importance. Furthermore, disciplinary differences overlap ideological ones.

One of the most intensely debated applications of power is in the study of local communities. Although concerned most directly with local politics, community power is linked to issues about the basic nature of democracy in modern society. The work that drew attention to power was Floyd Hunter's 1953 book on Atlanta, Community Power Structure: A Study of Decision Makers. Earlier community studies dealt with power only incidentally. Hunter made it central. Coming from a background in sociology and social work, Hunter nonetheless focused on politics and on how the system of representative government worked in practice. In response a pluralist school of thought headed by Robert Dahl (2005) challenged Hunter's finding that the business sector with its rich supply of economic and organizational resources could determine a locality's policy agenda. Instead, this school argued that governing is autonomous and that popular elections are the guiding force that keeps policy choices in line with citizen sentiments.

In its formative stage the community power debate set forth sharp alternatives. Are local communities dominated by the local business class like the pre–World War II "Middletown" studied by Robert S. Lynd and Helen M. Lynd (1929, 1937), or are they governed by shifting coalitions, with public officials often in the key role, like Dahl's postwar New Haven, Connecticut? With different cities at different times yielding different findings, grounds for amicable coexistence among researchers proved hard to establish. Hunter's Community Power Structure thus triggered a cross-disciplinary, ideologically infused controversy that lasted for a quarter of a century or longer. Each side elaborated a case for its argument and against the opposing argument, largely neglecting alternative possibilities. With the research task framed narrowly, pluralists could demonstrate that, as in New Haven, a small elite is not in control. However, their critics could also show that less-privileged segments of the population are left out and have little voice in governance. Contending sides consistently talked past one another, a pattern that has much to do with the nature of power and an initial focus on power as control.

Besides power as the ability of one actor to dominate another, some scholars see power as a shared activity in which people come together to do something that individually they could not do. The two forms can be thought of as power over and power to. The first refers to conflict where the preferences of one clash directly with the preferences of another. The second refers to circumstances in which the capacity to act comes through a combined effort, preferences are not firmly fixed, and conflicts are largely indirect and inferred. While the two forms of power may seem to have little to do with each other, in a community setting there are ample instances of both, and oftentimes they overlap. In conflict scenarios efforts to dominate often generate resistance, thus running up the cost of control. Attempted domination may give way to tacit bargaining over the degree of control and can even evolve into a form of exchange in which each party decides to give up something to receive something. This form of bargaining can shade into instances of power to.

As bodies of people with shared concerns, whether it be to maintain public safety or provide a medical facility, communities have a need to act collectively. To the extent that they have this capacity, they can be self-governing; but that capacity does not come free of complications involving both forms of power. In complex societies the governing function takes a distinct form, seemingly differentiated from other functions, and thereby becomes somewhat separated from the people as a whole. Under such a separation some elements may come together in support of their particular version of how to meet community needs. In this way they give strength to a capacity to act, that is, give shape to a form of power to. However, if others find themselves left out, then those left out may experience power as a form of being dominated. A capacity by one set of actors to shape a priority agenda potentially leaves others in a marginal position in the governance of the community.

In principle representative government is a check against one element of society ignoring the concerns of others. Essentially, then, the community power debate is over how the representative process functions in practice, with wide disagreement about the degree to which formally democratic systems operate in line with the ideals of
representative government. In a classic form set forth by Dahl, the pluralist school of thought sees politics as basically open and inclusive. No group is consigned to a marginal political standing. Pluralism, however, has been subject to a variety of critiques, including the charge that it is a legitimating ideology rather than an evidence-based explanation of how democratic politics actually works (Merelman 2003; see also Kariel 1966). Some antipluralists maintain that the central facts of local political life are about how some segments of society are well positioned to act on their concerns and to protect their interests while others suffer an unending disadvantage.

**APPRAOCHES AND UNDERLYING ASSUMPTIONS**

Pluralists and their critics (the latter variously called stratificationists, elitists, neo-elitists, or, the term used here, antipluralists) differ sharply in the assumptions they make about the political world to be studied. Although scholars do not divide into two highly unified camps, there are distinctly different schools of thought. Contrasting their assumptions is illuminating.

**Pluralist**

1. The authority of government is an important base of action, and in representative government competitive elections have a potential to make officials responsive to the citizenry. Although social and economic inequalities are consequential, universal suffrage can serve as a check against the accumulation of power in the hands of a few.

2. Society shapes politics in the following way: Over time deference to persons of high family status and wealth yields to instrumental understandings of authority. With increasingly differentiated roles and associated calculations of self-interest, conflicts are issue-specific and changeable. In this setting the exercise of control is costly and power inherently centrifugal.

3. Power is manifest in conflicting preferences and is evident in the observable actions of individuals.

**Antipluralist**

1. Because governing involves more than formal institutions of government, elected public officials have limited autonomy. They often seek support and cooperation from highly useful, even essential nongovernmental sources. Therefore, elections are not the pivot around which actual governance turns. Although there are rituals celebrating democracy and popular participation, they may disguise rather than reveal political reality. In a society in which investment capital is privately owned and various elements of society differ in capacity to mobilize, public officials are easily drawn to those who control abundant and attractive resources.

2. The functional usefulness of a governing capacity and the strategic advantages of positions within a governing arrangement serve to make resistance to those arrangements difficult. Although Robert Michels's (1959) law of oligarchy is less than ironclad, it is a factor because the leadership function is to varying degrees not subject to popular control. Therefore, even in a complex society, power is not inherently centrifugal.

3. Highly visible policy actions are insufficient evidence for understanding power. The flow of decisions and nondecisions is potentially more telling than specific controversies. Hence, agenda control is more fundamental than outcomes in particular issues. Asymmetrical dependencies, reputations for power, issue suppression, and manipulated rules and procedures are aspects of power important to study.

**FINDINGS AND THEIR INTERPRETATION**

**Pluralist**

1. In the continuing debate over community power, Dahl and other pluralists favor the term dispersed inequality. It is contrasted with traditional inequality, in which a small group of notables enjoy the combined advantages of status, wealth, and political office. The claim of dispersion rests on two dynamics. One is that, with electoral popularity differentiated from historical forms of deference, numbers can counterbalance wealth and social standing. If any high-status group aims for an expanded scope of influence, then its members must contend for popular support rather than pursue control on their own terms. The other dispersing force comes from the distribution of immediate interests. Everyone cares intensely about only a few matters of special concern. Because complex society produces highly differentiated concerns, intensities fragment to coincide with highly particular interests. Thus, interest group rather than class is the most useful term of analysis.

2. Because contenders for electoral office have incentives to be responsive to those most concerned about any given issue, the intensely concerned are influential in their special area of interest. And because the overall pattern is one of fragmentation,
those who are influential on one narrow issue carry little weight on many other issues. The narrowness of issues means that over time many different groups can be satisfied to some degree, although few groups get all they want. Politics is fluid, and the central political factor is the electoral connection between vote-seeking politicians and a citizenry capable of mobilizing against any threat to its particular but varied interests. While most citizens are politically passive most of the time, elite competition keeps the system open.

**Antipluralist**

1. Although antipluralists come in various guises, their shared position is that social and economic inequalities have deep roots with profound consequences for political mobilization. For example, Rodney E. Hero (1992) finds what he labels two-tiered pluralism, which has a surface layer in which lesser issues correspond to pluralism and a deeper layer of issues about race and ethnicity that formal equalities in suffrage and legal standing are ineffective in addressing.

2. Political arrangements have limited pliability. Conflicts compete with one another and any established arrangement constitutes a mobilization of bias that is not easily overturned. When applied to local governance, one body of issues may crowd others out and elections may be captive to historic or other loyalties, thereby reducing their potential for exacting accountability.

**ALTERNATIVE PERSPECTIVES**

Despite decades of debate and criticism, there remains a tendency for pluralism to be defined operationally as the absence of control by a small, cohesive elite. However, meeting this loose definition is not the same as the claim that politics is open and widely inclusive. For critics of pluralism the puzzle is how, beyond such specific factors as the mobility of capital, to account for the ongoing political weakness of the less privileged. After its peak in the 1960s and 1970s, the pluralist-antipluralist debate receded in salience, in part because both sides cast their argument in terms too narrow to address the full picture of local governance. Still, the community power concept is appealing in part because in principle it addresses the whole of the local political order and not just the actions of officeholders.

The whole of the local political order should not, however, be equated with a self-contained form of rule. European scholars have long cautioned against such an assumption and have called attention to national context (e.g., see Dunleavy 1980). They explain that the structure of intergovernmental relations may impinge greatly, and, depending on the circumstances that vary from country to country and from time period to time period, the business sector may not have a strong incentive to involve itself in local politics.

In the 1980s the aim of addressing the whole of the local political order regained footing through the idea of an urban regime. This concept shifts emphasis from who governs to questions about how governance takes place—which concerns have priority and why, what various participants in the process contribute, and how efforts come to be coordinated around some issues but not others. How key actors understand their situation is important, and this includes matters they take as a given. As a concept, urban regime provides a way of acknowledging that governance involves much more than operating the levers of the formal machinery of government. A regime consists of “the informal arrangements by which public bodies and private interests function together in order to be able to make and carry out governing decisions” (Stone 1989, p. 6). Arrangements, of course, do not just happen. They are created and maintained as a way of pursuing a set of aims, perhaps seeking to loosen some constraints while accommodating others. Because different agendas call for different kinds of arrangements, regimes in some sense indirectly compete. Any established arrangement for governing may hold a preemptive edge. While that edge may be surmountable, it takes a considerable combination of resources and effort to bring a new governing arrangement into being.

However, as with community power itself, it is important to remember that localities have only a constrained freedom to maneuver. Local governing arrangements mediate but do not control external forces. Thus, urban regimes are not autonomous, free-forming entities. Every regime is shaped by context, by the distribution of policy-relevant resources, by the mix of ideas at work, and by the ease with which various policy efforts can yield results. The internal dynamics of regime formation thus do not provide a sufficient basis for understanding how agendas take shape. Local agendas and the political arrangements that support them are, for example, greatly influenced by the position of a locality within a metropolitan region. Economic competition, the extent of revenue equalization through the intergovernmental system, and the ways in which local boundaries divide the metropolitan region socioeconomically all have a bearing on how agendas take shape and on what form political mobilization assumes. As a result, a full analysis of a local political order must pay close attention to context, both what part of the local context key players respond to actively and what part they take as a given.
The analysis of urban regimes calls for seeing power in a broader framework than power over. A useful step is to move away from the notion that actors are simply intentional agents pursuing self-defining interests. Such an understanding puts undue emphasis on who prevails in conflicts or who is positioned to suppress potential issues. It neglects the processes of attraction between potential coalition partners and how these processes affect policy aspirations.

If the world is seen as thoroughly relational in the sense that aims take shape in relations among actors who inform one another through deeds and words about opportunities and constraints, then it is understandable why socioeconomic inequalities are not easily overridden politically. Those inequalities are part of the building material out of which governing arrangements are constructed. There is deep tension between the ideal of political equality and the reality of socioeconomic inequality. Still, community power is about politics, and politics is about choosing. Political agency is the means for adjusting the terms on which socioeconomic inequalities and the equality of citizenship are accommodated to one another. Hence, the research task involves identifying creative ways to alter conditions and build new capacities. Some steps can make governing arrangements more open and inclusive, others less so. For that reason the study of community power remains timely even as the debates of the formative period have become less compelling.

POWER AND CONSTRAINED POLITICAL AGENCY

Since the publication of Dahl’s classic work in 1961, debate has often centered on the adequacy of the pluralist conception of politics. For example, Patrick Dunleavy charges that pluralists simply assume that conventional “input processes” determine political and policy outcomes (1980, p. 13). Historically, this assumption reduced Hunter’s concern with leadership in a broad community context to Dahl’s question of who governs. Moreover, by highlighting particular leaders, Hunter’s work also contributed to a preoccupation with who are the key policymakers. Subsequent work has only gradually returned to Hunter’s original insight that power is embedded in relationships, in networks of how people are related to one another in perceiving and responding to a community’s problems. The evolving intellectual challenge is to understand how human agents act within structured relationships, relationships that contain inconsistencies and are often in tension with one another. For example, one person/one vote is at odds with what Charles E. Lindblom terms the privileged position of business (1977). Because structures impinge on one another, they reach accommodations of varying depth and duration. For researchers, charting these accommodations is no easy matter, and the question of how deeply economic relationships affect others continues as a matter of debate.

While human agents have a creative capacity, they are constrained to act collectively, not as asocial individuals, but as actors within an array of economic, social, and political relationships in place. Although change is feasible, working through well-established relationships is easier than bringing about fundamental change in relationships. However, because altering relationships is possible, one must look at varying capacities to reconstruct governing arrangements. This dimension of power is not evident on the surface in much political activity, because it works within and does not challenge most relationships. Standing alone, power over does not capture this deeper level. This deeper level involves the degree of difficulty encountered in reshaping power to. In short, some realignments are easier to bring about than others, but the complexity of that process defies being expressed in any succinct formula.

Consider the two aspects of power to. It has an output side—what human agents can produce together—and an input side—the factors that bring people together in a form of cooperation. Just as there are features that enable one actor to dominate or resist another, so there are features that make cooperation between actors more attractive or less so. To the extent that alignments for cooperation compete for governing space, competition may be indirect and lack overt expression. For example, some alignments may preemptively displace other possible alignments. Power at this level is hard to observe except through its expression in a long flow of events and their counterfactuals.

If analysts assume that politics is a kind of zero-sum game of openly clashing policy preferences, then they will not engage this underlying dimension of power. Players in the political game compete, but a different understanding of power emerges in realizing that they also have varying degrees of attraction to one another. As they come together, one constellation of attractions may foreclose others. Attraction stems partly from the objectives that players can achieve by combining efforts, but other considerations come into play as well.

The study of community power is ultimately about understanding how competition and attraction toward cooperation interact. Competition is easier to observe through the immediate actions of individuals. In contrast, attraction toward cooperation is embedded in and reinforced through relationships, some of which may simply be taken as a given. Political creativity is partly about altering relationships by developing new channels of awareness and thereby posing new possibilities.
That power has an intentional aspect should not lead to the conclusion that it operates only in an intentional manner. Discovery of the possible is part of the power process, and discovery may precede fully developed intention. However, discovery is constrained by the greater difficulty of altering some relationships over others. That is why power to is a necessary complement to power over. Because constructing some versions of power to is easier than others, a full understanding of community power has to include both power over and power to—both have a bearing on how the politics of democratic representation operates in practice.

The future prospects of a democratic way of life rest on an ongoing exercise of political creativity, but that creativity is itself constrained by the multiple networks of relationships within which it is exercised. Community power is a concept that treats power as relational and relations as structured by the ways in which multiple facets of life intersect. Questions about community power have not disappeared, but instead, since the formative period of debate, have evolved to take into account an expanded appreciation of the complexity of the local setting.

Comparative Dynamics

Comparative dynamics does for dynamics what comparative statics does for statics. The difference lies in the fact that comparative dynamics is concerned with the effects of changes in the data (parameters, exogenous variables, initial conditions) on the whole motion over time of a dynamic economic model. This motion will usually be some sort of dynamic equilibrium path, such as, for example, a steady-state growth path where all variables grow at constant rates, or an optimal path deriving from a dynamic optimization problem.

The method of comparative dynamics can be summarized as follows. We have a set of dynamic functional equations, whose solution gives the time path of the economic system. In this solution, parameters, exogenous variables, and initial conditions also appear. Therefore, a different solution (time path) corresponds to a different set of data. It is then possible to ascertain the effect on the solution of a change in any one of the data.

Comparative dynamics, as such, does not say anything about the transition from one equilibrium growth path to another: The study of this transition belongs to stability analysis. Additionally, the conditions of stability of the equilibrium path may be useful in obtaining information on comparative dynamics: This can be regarded as the dynamic analogue of Paul Samuelson’s correspondence principle in comparative statics, with dynamic equilibrium path replacing static equilibrium point.

This is about as far as one can go with intuition. Formally, take the case of steady-state growth and consider a differential equation system

$$\frac{dx(t)}{dt} = f[x(t), \omega(t), \theta],$$  \hspace{5cm} (1)

where $x$ is a vector of endogenous variables, $f$ is a vector of functions, $\omega$ is a vector of exogenous variables (given functions of time, also called forcing functions), and $\theta$ is a vector of parameters. We are interested in a particular solution of this system that serves as the reference path for comparative dynamics. If we assume that all the exogenous variables grow at a constant proportional rate (which may be equal or different across variables), we have

$$\omega_i(t) = \omega_i(0) e^{\gamma_i t}, \quad i = 1, 2, \ldots, n,$$ \hspace{5cm} (2)

where $\omega(0)$ and $\gamma_i$ are given. A steady-state (or balanced-growth) path is a particular solution to system (1) having the form

$$x_i(t) = x_i(0) e^{\rho_i t},$$ \hspace{5cm} (3)

where the initial values $x_i(0)$ and the growth rates $\rho_i$ are to be determined. This particular solution is usually obtained by the method of undetermined coefficients: equations (2) and (3) are substituted into system (1) and the values of $x_i(0)$ and $\rho_i$ are determined so that the system is identically satisfied. This will give rise to a set of equations in the unknowns $x_i(0)$ and $\rho_i$; Typically, the $\rho_i$ are obtained by solving the equations derived from equating to zero the coefficients of the terms containing $t$, whereas the $x_i(0)$ are obtained by solving the equations derived from equating to zero all the other terms not containing $t$.

The solution will express the unknowns in terms of the data; usually we shall obtain

$$\rho_i = h_i(\gamma_i, \theta),$$ \hspace{5cm} (4)

$$x_i(0) = \phi_i(\omega(0), \gamma_i, \theta),$$ \hspace{5cm} (5)

where $\vartheta \subset \theta$, that is, $\vartheta$ is a vector containing just a few parameters of the full set of the model’s parameters. The functions $h_i$ are typically fairly simple, while the functions $\varphi_i$ are often very complicated. All results from comparative dynamics are obtained calculating the partial derivatives of the functions $h_i$ and $\varphi_i$, with respect to the element we are interested in.

COMPARATIVE STATICS

Comparative statics is a methodological concept of economic theory and is related to economic models. An economic model consists of a set of relations among economic variables. These relations may be definitional, behavioral, or technological in nature. For instance, in the model of a competitive market there are three relations. The first two are behavioral relations describing how the buyers and sellers behave in the market. The behavior of the buyers is summarized in a demand relation in which the quantity of a good demanded in the market depends on its price and the total income of the buyers. The supply relation states that the quantity of the good supplied in the market depends on its price and the number of sellers supplying the good. The third relation of the model defines equilibrium as a situation in which the quantity demanded is equal to the quantity supplied. The market model involving these three relations is designed to explain the values of three endogenous variables: quantity demanded, quantity supplied, and the price of the good. Under certain conditions the model can be solved to get the values of endogenous variables in a static equilibrium. But there are two exogenous variables in the model—the total income of the buyers and the number of sellers—and the model is not designed to explain the values of these variables. A static equilibrium may be disturbed when there is a change in number of sellers, for instance. An increase in the number of sellers may occur if new firms enter the market where the existing firms are earning economic profits. In this case, a new static equilibrium will emerge. The methodology of comparative statics allows the theorist to compare these two static equilibria.

Comparative statics was introduced by the British economist Alfred Marshall (1842–1924) in his book Principles of Economics (1890), in which he discussed the effect of entry or exit of firms on market equilibrium. Later, Paul Samuelson developed the concept of comparative statics systematically in his book Foundations of Economic Analysis (1947), along with the related concept of comparative dynamics. Comparative static methodology is used in all branches of economic theory because it enables the theorist to derive a set of hypotheses that can be empirically tested. Theoretical econometrics and applied econometrics owe their existence largely to the development of comparative static methodology, and the contribution of these two allied fields of economics to economic policy analysis is tremendous.

To illustrate comparative statics in a market model let us state the demand and supply relations as:

1. \[ Q_D = f(P, Y) \]
2. \[ Q_S = g(P, N) \]
3. \[ Q_D = Q_S \]

The endogenous variables in this three-equation market model are \( Q_D \) (quantity demanded), \( Q_S \) (quantity supplied) and \( P \) (price). The exogenous variables are \( Y \) (income) and \( N \) (number of sellers).

The figure above shows an inverse relationship between price and quantity demanded for a given level of income, \( Y \). The relationship between price and quantity supplied is a positive one, and the diagram shows four supply curves for the number of suppliers ranging between \( N_1 \) and \( N_4 \). The price quantity combination \((P^*, Q^*)\) is one static equilibrium when the number of suppliers is \( N_1 \). Another static equilibrium is represented by the price quantity combination \((P', Q')\) when the number of suppliers increases to \( N_4 \).

It is possible to derive a testable hypothesis by using comparative static methodology, provided that certain conditions are satisfied. First, the two static equilibria that we are comparing must exist and be stable. If the demand and supply curves do not intersect at all or if they do not intersect in the positive orthant, market equilibrium does not exist. Second, we must have an established theory connecting the number of firms that is exogenous to the model with the quantity supplied that is endogenous. Because the theory of supply predicts a positive relationship between the quantity supplied and the number of firms, the testable hypothesis that emerges is: as the num-
ber of firms increases in the industry, price falls and more quantity of the good is bought and sold in the market.

Comparative static methodology is also used in optimization models, where the conditions under which it works are somewhat different. In economic theory, consumers maximize utility subject to their budget constraint, or the producers maximize profits subject to technological constraints. These models also have a set of endogenous and exogenous variables. If we take the case of a competitive firm, the quantity of output produced or the quantities of inputs used in production are endogenous variables, but the prices of goods produced or the prices of inputs are exogenous variables. In the consumer model, the quantities of goods purchased are endogenous variables, but prices paid for these goods as well as amount of money spent are exogenous variables. A typical testable hypothesis is the law of demand that says that if the price of a good decreases, the consumer tends to purchase more quantities of that good. This hypothesis can be analytically derived by the use of comparative static methodology, provided that a maximum of the consumer's utility exists subject to the budget constraint. Similarly, for deriving any hypothesis related to the behavior of producers it is necessary that the profit function have a maximum. Thus, the comparative static methodology fails in the competitive model if there are increasing returns to scale, because profit function does not have a maximum. Under increasing returns to scale, the firm can always reduce unit cost by expanding the scale of output that can be sold at a fixed price.

Many economic variables such as quantity demanded or supplied are nonobservable. Econometricians can estimate both demand and supply functions only under certain conditions. In the figure above, demand is stable, but supply curve shifts as the number of firms changes. In this case, the demand curve can be estimated from data on price and quantity, but the supply curve cannot. Empirical estimation is crucial for predicting the effects of a tax or subsidy on welfare.

COMPENSATING VARIATION

SEE Wages, Compensating.

COMPENSATION, UNEMPLOYMENT

Unemployment compensation (or benefit) consists of an insurance payment, generally financed by payroll contributions, that is paid to workers entering unemployment. This public insurance payment allows workers to smooth their consumption patterns when facing adverse employment outcomes in the presence of financial market imperfections and incompleteness that make it impossible or too costly for private, for-profit insurance firms to cover workers against such risks. The compensation is usually available for a limited amount of time, during which unemployed workers are supposed to search for a new job.

The first unemployment insurance system was introduced in 1789 in Basel, Switzerland, by a local trade union. More comprehensive schemes, managed by local authorities, were set up in France, Belgium, and Switzerland in the late nineteenth century. The first national program was established in the United Kingdom in 1911. Germany and the United States followed with, respectively, the Job Placement and Unemployment Insurance Act of 1927 and the Social Security Act of 1935 in response to the Great Depression. Nowadays unemployment compensation schemes are widespread under alternative enforcement rules and regulations in many Organization for Economic Cooperation and Development (OECD) countries.

One way of measuring the generosity of the unemployment compensation program adopted in a country is by calculating the amount of the average compensation as a ratio of the average wage. This indicator is known in the economic literature as “replacement ratio.” Another important characteristic of unemployment compensation schemes is the duration of the benefit, which can range from a few months to indefinitely. A further important element of unemployment compensation programs is the strictness of the enforcement rules governing the receipt of the benefit. For example, sometimes unemployment compensation is conditional on the recipient’s actively searching for a new job or on accepting any job
offered. These rules may be enforced with different degrees of strictness, depending on the formal and informal rules prevailing in each country. In the United States unemployment benefits are paid only to workers who lose their jobs as a result of dismissals; employees who voluntarily quit their jobs and new entrants to the labor market are not eligible. Federal law provides general guidance for administering unemployment compensation schemes, and each state has its own regulations and eligibility criteria.

Despite helping the unemployed in hard times, unemployment compensation schemes may also have perverse effects. Economic theory predicts that generous unemployment benefits tend to increase reservation wages. As a result, if the compensation is provided for an indefinite period, unemployment could increase as workers have less incentive to enter employment. In turn this could increase the average length of unemployment spells, triggering a rise in long-term unemployment. With this in mind, many countries have constructed unemployment compensation schemes that are limited in duration and contingent on active job search.

COMPETITION

In neoclassical economic theory, the highest state of competition is called perfect competition in which there are a large number of small-sized firms each of which is assumed to be a passive price taker. With perfect information flows and mobility, inter-industrial competition ensures equalized profit rates across all sectors. Finally, intra-industrial competition ensures identical technologies thereby leading to equalized profit rates between firms within each industry. At equilibrium there is full capacity utilization.

Various models of imperfect competition, in which firms are price setters, are seen as the opposite of perfect competition. Under monopolistic competition there are a large number of firms. With free entry and exit, each firm’s downward-sloping demand curve intersects the average total cost to the left of its minimum point on its average total cost curve. At the resultant equilibrium, there is excess capacity with higher-than-minimum cost and price.

Under oligopolistic competition, game theory is used to model strategically competitive behavior among a relatively small number of firms whose market power allows them to erect barriers to entry. Game theory, in which each firm is assumed to have the information to be able to anticipate precisely the actions of rival firms, generates a payoff matrix and devises the most optimal competitive strategy. At equilibrium, each firm maintains excess capacity to deter competition (Dockner et al. 2000, p. 253). As discussed below, this situation is likely to be unsustainable under Keynesian uncertainty when each firm strives to cut costs and prices.

The problem with all the above models is that none includes price- and cost-cutting behavior, an odd failing given the reality of outsourcing to low-wage regions of the world. The remaining part of this essay deals with three different theoretical schools that have rejected the neoclassical theory of competition. We first deal with the classical Marxian perspective (Clifton 1983; Shaikh 1980, 1982; Semmler 1984; Botwinick 1993). The central argument in this literature is that the quantity and size of firms is immaterial with regard to pricing: all firms are aggressive price setters. The pursuit of surplus value leads to increased levels of mechanization. Thus a larger scale of investment forces firms to increase their market shares in order to make such large investments profitable. Price- and cost-cutting constitute the main methods by which each firm “makes room for itself” in the market. Furthermore, this literature rejects the notion that large-sized firms have market power and therefore erect barriers to entry, since in recessions such firms can face barriers to exit. The presence of large amounts of sunk costs makes it difficult for such firms to disinvest, thereby making them subject to potentially heavy losses.

Indeed, it is the presence of varying levels of fixed capital that makes capital mobility across industries a relatively slow process. Quite simply, it takes time to invest and disinvest. Thus profit rates are likely to be different from one another at any given moment. Profit rate equalization happens only as an approximate process over what Karl Marx (1818–1883) called “the cycle of lean and fat years” (Marx 1894, p. 208).

Finally, technological change and fixed capital imply the existence within an industry of different technology
vintages, each with its own unit production costs. With roughly equal selling prices, this implies the coexistence of different profit rates. The issue of monopoly power is irrelevant to both intra-industrial and inter-industrial competition.

Based on the prewar survey work done by the Oxford Economists’ Research Group (Andrews 1949), Roy Forbes Harrod (1900–1978) radically revised the conventional model of imperfect competition. As in the classical Marxist perspective, price- and cost-cutting are at the core of Harrod’s critique (1952).

Harrod’s critique begins with the standard assumptions of monopolistic competition: price-setting behavior, free entry and exit, and a downward-sloping demand curve faced by each firm. Harrod argues that the standard equilibrium in which there is excess capacity with above-minimum costs and prices is not sustainable since each firm faces a penalty for not minimizing costs and prices. The threat from potential low-cost rivals in a world of Keynesian uncertainty makes every firm defensively lower its costs and prices in an attempt to safeguard its market share. In the event of excess capacity, each firm will cut back investment, thereby reducing its capacity. In the aggregate, the reduction of investment will also reduce aggregate demand and thus output. With overutilization of capacity, the increase in investment will raise both aggregate capacity and output (demand). In either case, a solution to the knife-edge problem (Shaikh 1989) will ensure that output and capacity are approximately equal to each other around the minimum point of each firm’s cost curve.

Finally, the Austrian school contends that static equilibrium and perfect information preclude the real-world rivalrous competitive behavior that entrepreneurs engage in under capitalism (Kirzner 1997). Austrian authors emphasize the fact that competition actually takes place under conditions of fundamental uncertainty that are not subject to probabilistic calculations. This in turn implies that price and quantity setting by firms may propel the system away from equilibrium for considerable periods, although there could also be tendencies toward equilibration. Competition is, in effect, a dynamic process.

SEE Long Period Analysis.

COMPETITION, IMPERFECT

Imperfect competition exists in markets that are not perfectly competitive—that is, markets in which some buyer(s) or seller(s) have market power. That market power may derive from a limited number of buyers or sellers or from differentiation between each firm’s products. Although almost every one of the world’s markets falls into this category, we often study the simpler case of perfect competition first, then study monopoly, and follow those benchmarks with more detailed models of imperfect competition.

Perfect competition—that is, identical products sold to many buyers and available from many sellers who may easily enter and exit—may be one of the most unrealistic of market assumptions. Because there are many buyers and sellers, no single market participant can have a signif-
significant effect on the market price. As a result both buyers and sellers take the market price as fixed and use it to determine their levels of consumption and production. The market for wheat is an example of perfect competition. There are many buyers, many sellers, and little differentiation among each farmer’s product. Although the theory of perfect competition appears unrealistic, many of its results are similar under other market structures. As Milton Friedman (1953) emphasizes, the usefulness of a theory lies not in its realism but in its ability to predict outcomes. Perfect competition does this well, and we should judge models of imperfect competition not on their realism but on their ability to make useful predictions and provide improved insights into the functioning of markets.

MONOPOLY AND MONOPSONY

Monopoly falls under the category of limited competition because it assumes that a single producer sells a product with no close substitutes to many buyers and benefits from barriers to entry by other firms. It is the simplest model of limited competition and lies at the opposite end of the spectrum from perfect competition. An example of monopoly in the early twenty-first century is Microsoft Corporation’s operating system Windows (U.S. v. Microsoft, Civil Action No. 98–1232 [2000]). When a seller has market power, the price may remain higher than a competitive market would otherwise.

As in perfect competition, there are few markets that actually satisfy our assumptions, but this simple model of monopoly allows us to understand the basic features of market power. But even in the case of Microsoft, market share does not reach 100 percent.

The market power held by a monopolist can be measured in several ways. The Lerner Index (Lerner 1934) considers the price markup over marginal cost as a fraction of price: \((P - MC)/P\). It can be shown that this also equals the inverse of the own-price elasticity of demand (technically, its absolute value). Thus the more willing buyers are to do without the monopolist’s product, the smaller the monopolist’s profit-maximizing markup. Measuring marginal cost is difficult in practice (Fisher 1987) because economic cost (rather than accounting cost) is required. Typically neither policymakers nor the courts have good measures of the firm’s true costs; if any measure is available, it is usually average cost rather than marginal cost. Elasticity is easier to measure than marginal cost. In antitrust proceedings, both the own-price elasticity (the reaction of a product’s demand to changes in its own price) and various cross-price elasticities (the reaction of one product’s demand to changes in other products’ prices) are estimated to determine the extent of an alleged monopolist’s market power. The legal definition of monopoly is 80 percent market share of the relevant market, where the markets are often defined using estimates of cross-price elasticities. It is important to note that monopolies are not illegal under U.S. law, but any firm found to have monopoly power is subject to more stringent laws concerning potential abuse of that firm’s market power.

Monopsony is also a model of limited competition that lies at the opposite end of the spectrum from perfect competition; its simplicity is that a single buyer purchases from many sellers. For example, the steel mill in a town without other steel employers can be modeled as a monopsony, and so can the National Football League. In this case, the buyer has market power and may keep the price lower than a competitive market would otherwise. In our two examples, the “price” that is depressed due to market power is workers’ salaries.

One economic cost to monopoly and monopsony (and to market power in general) is due to “allocative inefficiency,” an outcome where marginal benefit (the marginal buyer’s willingness to pay) is not equal to marginal cost (the marginal seller’s willingness to sell). In the case of monopoly, this is because marginal cost is greater than the price charged, whereas in the case of monopsony, marginal benefit is less than the price paid. In both cases, market power causes too few goods to be traded—fewer goods, that is, than would be allocated by a competitive market.

If the number of buyers or sellers is small, they may “collude” to limit competition. This is referred to as a buyer or seller “cartel.” Such behavior is illegal in the United States, but cartels such as the Organization of Petroleum Exporting Countries may operate internationally. Because the largest reward that any single seller or group of sellers can receive from participation in a market is the monopoly profit, we can consider a producers’ cartel to be acting to maximize the members’ joint profits. It is likely that any cartel will have difficulty policing its members’ behavior. Each individual firm has an incentive to deviate from the seller cartel-maximizing price (by selling at a slightly lower price) or quantity (by selling slightly more quantity). A buyer cartel likewise has the incentive to deviate by offering a slightly higher price and buying more quantity than the buyer cartel’s joint-maximizing price and quantity.

MONOPOLISTIC COMPETITION

With these simpler models described, we now consider firms with market power acting noncooperatively. As mentioned above, product differentiation is one reason market power may arise. This is the model of “monopolistic competition” (Robinson 1934; Chamberlin 1933) or “differentiated products” (Hotelling 1929; Salop 1979; Eaton and Lipsey 1989). Here, as in perfect competition,
there are no barriers to entry, and as a result firms receive zero economic profits in the long run. Yet because differentiated products face a downward-sloping demand curve, price is still above marginal cost, and the market is not allocatively efficient. This does not tell us the entire story, however; we cannot ask firms to charge a lower price, as we might imagine asking the monopolist to do. The monopolistically competitive firms expect zero economic profits in the long run already. Instead, we focus on the incentive for firms to enter the market, to find products that differ in some aspect from existing products. This behavior results in "excessive product differentiation" and "excess capacity." Production costs are higher than they might otherwise be. Due to the many different products produced, firms do not minimize their average costs as perfectly competitive firms would. Just as many "realistic" markets are made up of many firms with differentiated products, this prediction of the models rings true as well. Do we really need so many different kinds of shoes, bicycles, and mystery novels to choose from? Of course in these cases it is also difficult to justify regulation that would lead to an improved outcome. One case in which we may observe market participants' bargaining to improve the outcome is in the health care industry. For example, Preferred Provider Organizations limit patients' choices in return for lower fees and physicians' lower average costs (Arizona v. Maricopa County Medical Society 457 U.S. 332, 334 [1982]; Lynk 1988).

OLIGOPOLY AND OLIGOPSONY

Market power may not only arise from differentiated products; it may also be due to the existence of only a few sellers in the market (oligopoly) or only a few buyers (oligopsony). Oligopolies’ market power can be measured by an average of the firms’ Lerner indices as well as through the firms’ market shares. An industry’s n-firm “concentration ratio” (CRn) is the market share held by the largest n firms. The Department of Justice and the Federal Trade Commission typically use the 4-firm concentration ratio, although in the early twenty-first century cellular phone market 2-firm concentration ratios are reported (because CR4 is often 100 percent), and in other markets the antitrust authorities may report 8-firm concentration ratios. Alternatively market power can be measured by the Herfindahl-Hirschman Index (HHI), which equals the sum of the squared market shares of all firms in the industry. Thus the HHI can vary from a limiting value of zero under perfect competition to (100)² = 10,000 under monopoly. Most cross-country industry studies measure similar variation for the HHI and CR4.

The study of oligopoly and oligopsony requires the mathematics of game theory because each firm takes into account its rivals’ reactions to and anticipation of its own actions. Such behavior can lead to strategic decisions that are intended solely to constrain the choices of current and potential rivals. For example, an incumbent firm may choose to increase its productive capacity to deter other firms’ future entry (Dixit 1979).

INTERNATIONAL TRADE

Market power can also explain the level of trade between nations (Helpman and Krugman 1985; Helpman 1988; Baldwin 1992). Two examples illustrate the effect of both sources of market power—product differentiation and few domestic producers—on international trade. Under perfect competition, it is hard to justify why two countries would trade the same product—wheat or potatoes, for example. Each country should focus on the good in which it has a comparative advantage. But when consumers value variety, as in the case of differentiated products such as computers or cars, then two countries can produce more varieties of the good than one country can. Rather than limiting consumers’ choices to the varieties their own country produces, a wider market—an international market—can exist for both countries’ varieties. Market power can even explain the prevalence of cross-border trade with identical products produced in each country if each firm has monopoly power (or equivalently, a cartel) in its domestic market. In this case, each country’s monopolist has an incentive to compete with the other country’s monopolist, as long as transportation costs are not too high, precisely because domestic prices are above marginal cost. Although consumers in both countries benefit because of the effect this international competition has on prices, the fact that both firms incur transportation costs to export from their home country means that the outcome is less efficient than if each firm had just increased its own domestic production.

COMPETITION, MANAGED

This idea for the reform of health-care finances was conceived by Alain C. Enthoven of Stanford University and fostered by a think tank of health-care professionals in Jackson Hole, Wyoming. Managed competition formed the basis of the proposed health-care reforms of the Bill Clinton administration. The plan required the creation of large health-insurance purchasing cooperatives, which were designed to have the leverage to enforce competition among different health-care plans. Managed competition aims to maintain quality of service and protect universal criteria of provision while also containing costs.

This strategy of financial management for health-care organizations has emerged since the mid-1970s in a context of mounting costs resulting from the increasing demand for services, especially in societies where aging populations and the decline of the family have put greater strain on existing services and institutions. Managed competition can be technically defined as a purchasing strategy to maximize value for both consumers and employers by adopting principles from microeconomics. A sponsor, whether in the private or the public sector, acting in the interests of a large number of subscribers, regulates the market to avoid attempts by insurers to suppress price competition. Through this strategy, the sponsor attempts to create price-elastic demand and reduce market risks. This type of financial management has been attractive for employers and insurers in the U.S. health sector because, while controlling prices, it offers pluralism in services and maintains individual choice for consumers, but it also approximates universal coverage.

In The Logic of Health-Care Reform (1994) the sociologist Paul Starr outlined several elements that are necessary for this strategy to achieve its objectives: There must be standard benefits that can guarantee a minimum level of coverage (such as hospitalization), thereby making comparisons in quality between plans possible; services should be accessible in principle to all customers regardless of any preexisting health condition (such as diabetes), and the premiums should not be unfairly influenced (for example, by age or gender); and the competition should force plans to provide detailed cost information to both consumers and employers.

Managed competition should be distinguished from managed care in health delivery. In managed care, networks of hospitals, physicians, and care providers offer accessible and economical care—for example, through preferred provider organizations (PPOs) that have contracted with insurers or employers for a discounted fee. However, such fee-discounting arrangements cannot in the long run monitor quality of service.

The aim of Enthoven’s scheme was in fact to ensure that customers rather than employers would make health-care choices on the basis of cost. The difficulty facing most forms of health care is how to achieve equity in care between the chronically sick and the relatively healthy while also controlling costs. In the Enthoven scheme, one strategy to address this situation is through the creation of regional centers of medical technology to share technical costs with a range of groups.

Although managed competition as an idea has been around since the 1970s, it is generally agreed that the U.S. health-care system is failing in terms of cost control, quality, and provision of services across society. The employer-based system does not offer coverage to individuals whose employer does not offer health insurance or to those who are self-employed or who are unemployed but not poor. In the early twenty-first-century situation, there is little incentive for improving efficiency on the part of providers. In short, there is no market mechanism to create incentives for delivery systems to reduce the costs of care.

The health-care systems of all advanced societies are exposed to similar problems of price inflation, administrative inefficiencies, and mounting costs resulting from dependence on advanced medical technology, the health-
care needs of aging populations with chronic illness, and the rising expectations of customers for better services. These difficulties face societies such as the United Kingdom and Sweden, which have had, at least since the end of World War II (1939–1945), state-supported, universal health care with free provision of services at the point of delivery. In these societies, however, there has been growing privatization of health care through greater provision of private medical insurance. In the United Kingdom both Conservative and Labour governments encouraged the creation of quasi-markets inside the National Health Service (NHS) to promote price controls through competitive tendering and outsourcing for services. Despite these reforms, there are many problems with the NHS, such as significant regional inequalities in provision—the so-called postcode lottery—and difficulties in recruiting adequately trained staff. Despite claims that managed competition has been successful (e.g., in Florida and Indianapolis) in cutting costs, it is not clear that any of these reforms have successfully sustained equality in services and cost-effectiveness in delivery.

COMPETITION, MARXIST

The treatment of competition captures the methodological difference between the neoclassical and materialist (Marxist) approach to social and economic relations. In the former, competition is the interaction of individual economic agents through exchange in pursuit of self-interest, be they consumers, workers, or owners of capital. The principle conditions necessary for competition are many buyers and sellers, and free entry to and exit from the market. Thus, competition is a question of numbers. Competition declines as the number of producers declines; monopoly is the absence of competition. In this analysis competition is an equilibrating force that brings efficiency to markets. The restriction of competition by government action undermines this efficiency. Private sector barriers to competition, such as collusion among producers, represent market failure.

Marx criticized this approach as an “absurdity of regarding [competition] as the … existence of free individuality in the sphere of consumption and exchange. Nothing can be more mistaken” (Marx [1858] 1973, p. 649). Briefly stated, Marx argued as follows: Capitalist production arises historically from the separation of labor from the means of production; in order to produce and live, workers must be employed by capital (“free wage labor”). This labor relation gives capital its mobility, both geographically and across sectors of production. Competition among producers (or “capitals,” Marx’s term) results from the conceptually prior competition between capital and labor: “Free competition … is first the free movement of capital and nothing else” (Marx 1973, p. 651). A producer may temporarily monopolize the production and sale of a particular commodity, but cannot monopolize the market for labor services (labor power).

From this analysis it follows that as the number of competitors in a sector of industry declines, competition intensifies:

In practical life we find not only competition, monopoly, and the antagonism between them, but also the synthesis of the two…. Monopoly produces competition, competition produces monopoly…. The synthesis is such that monopoly can only maintain itself by continually entering into the struggle of competition. (Marx and Engels 1976, p. 197)

By this line of argument, competition is not an equilibrating force, but a destabilizing conflict among capitalist enterprises, leading to imperialism and wars between capitalist powers (this is explained in Weeks 1981, Chapter 6). While this approach may seem strange to the point of bizarre to twenty-first-century economists, in the mid-twentieth century it was very much part of the mainstream. In 1947, K. W. Rothschild linked competition to conflict in an article in the Economic Journal, the most prestigious publication in the profession at the time. His argument is quite consistent with Marx’s analysis:

[A] theory of markets can be complete and relevant only if its framework includes all the main aspects of the struggle [by corporations] for security and position. Like price wars, open imperial-
ist conflicts will not be the daily routine of the oligopolistic market. But, like price wars, their possibility and the preparation for them will be a constantly existing background … and the imperialistic aspects of modern wars or armed interventions must be seen as part of a dynamic market theory just as the more traditional “economic” activities like cut-throat pricing … for there is no fundamental difference between the two. (Rothschild 1947, p. 319)

In light of the international tensions, conflicts, and wars since the end of the cold war, in some cases involving access to resources, it is perhaps worth revisiting Marx’s analytical approach to capitalist competition.

**BIBLIOGRAPHY**

John Weeks

**COMPETITION, MONOPOLISTIC**

Economists have a spectrum of models with which to analyze how competing firms interact. The simplest of these involve situations in which firms can choose quantities and other variables (product quality, and advertising), without having to consider the reaction their choices might generate from other firms. Obviously, when there is a single firm in a market (a monopolist), this occurs by definition, as there are no other firms to do the reacting. However, it is also the key assumption underlying perfect competition, where firms are assumed to take prevailing prices as given. Specifically, firms believe that if they charge a higher price than the market price, they will lose all of their customers. The problem with perfect competition is that, in reality, competing firms have some discretion over the price, and they can therefore raise them without losing all of their sales. In this situation, however, firms might be “small,” and so it might be reasonable to presume that they can be modeled independently of other firms’ potential reactions.

Monopolistic competition is the term given to this “middle ground.” An industry is defined as monopolistically competitive if: (a) there are many producers and consumers in the industry; (b) consumers have preferences that may cause them to favor one specific firm over another; and (c) there are no barriers to entry or exit. Conditions a and c are also features of perfect competition, so the critical distinction comes from condition b, whereby the products sold by firms are not homogeneous (i.e., perfectly substitutable) in the eyes of consumers. Consumers may favor one firm over another because of location, branding issues, knowledge of quality, advertising and marketing appeal, or individual product characteristics.

In many respects, the outcomes from monopolistic competition are similar to those from perfect competition. First, in long-term equilibrium with identical firms, profits are dissipated by competition, and entry occurs at the point where the marginal firm is earning enough to cover fixed or sunk-market entry costs. Second, prices reflect average production costs. However, because the firms have some pricing discretion, they will charge a mark-up over their marginal costs (even in the long-run) and conceptually will be able to recover fixed costs associated with, say, product development. This also means that, compared with perfect competition, prices will be higher and quantity lower in monopolistic competition, leading to a debate as to whether this sacrifice is made up for by product variety.

It is this latter implication that has perhaps proved most significant in giving monopolistic competition greater prominence in economic analysis. Monopolistic competition was independently developed by Edward Chamberlin and Joan Robinson in the early 1930s. Each was motivated by a problem with perfect competition identified by Piero Sraffa, who noted in 1926 that if firms had fixed production costs and falling average costs (i.e., economies of scale), then perfect competition imposed no limit to firm size. This could not be reconciled with the reality of smaller firms even where economies of scale appeared to be present. Chamberlin and Robinson saw the reconciliation of this problem in the notion that competing firms might have downward sloping individual demand curves. Chamberlin assigned this trend to the existence of product differentiation, while Robinson found that it came about because of an imperfect adjustment response from other firms (today termed “residual demand”). This meant that individual firms would be limited in their ability to realize scale economies because of entry by others who could pick up some consumers by supplying a differentiated product.

The marrying of economies of scale and competitive pressures led to important developments in other areas of economics. In 1977, Avinash Dixit and Joseph Stiglitz
developed a tractable model of monopolistic competition that allowed for a convenient analysis of product variety (and showed that too few products would be produced relative to the social optimum). This model formed the basis for new trade theory (Krugman 1979), new growth theory (Romer 1987), and new economic geography (Krugman 1991), each of which required a model that enabled firms to have economies of scale, yet also be limited by competitive pressure.

COMPETITION, NEOCLASSICAL
SEE Competition, Perfect.

COMPETITION, PERFECT

The concept of perfect competition is an idealization of friction-free, smoothly functioning, anonymous markets that, at best, serves as a benchmark to the markets that exist. Perfect competition is an abstraction based on underlying assumptions concerning: (1) the number of competitors; (2) the homogeneity of the product being sold; (3) the ease of entry into the market; (4) the level of knowledge and competence of competitors; and (5) the independence of competitors’ behavior.

Heuristically, these five conditions are satisfied when: (1) both the number of buyers and the number of sellers are sufficiently large that it is virtually costless to switch trading partners; (2) the goods being traded by various sellers are more or less perfect substitutes for each other; (3) the entry and exit by buyers and sellers are more or less cost free and swift; (4) all agents are more or less aware of the previous market prices, and they are close together; and (5) the agents do not form coalitions in trading, and they act independently and more or less anonymously.

These conditions are easy to grasp in nontechnical terms, but making them mathematically precise is both worthwhile and difficult. Historically, the work in the economics of oligopoly of A. A. Cournot (1836) and Edward Chamberlin (1933) provides the basic examples for competition with homogeneous and differentiated goods. In the first instance, perfect substitutes are traded; in the second, the product of each individual differs from the others. The difference between oligopoly and perfect competition is that in the latter, numbers are assumed to be so great that it is not worthwhile for individuals to attempt to consider the detailed actions of other individuals. They thus view price and the market as an aggregate.

In perfect competition, the conditions for entry into the market amount to the proposition that there are no high barriers, such as hard-to-obtain licenses, social pressures, or extremely high set-up costs, to prevent potential new entrants from going into business. The condition that is possibly the most difficult to make precise is that on information. In the dynamics of the market, it is extremely difficult to determine who knows what from minute to minute. If there is a formal trading mechanism that forms price, such as a simultaneous sealed bid, the conditions can be described precisely. In an open-cry market, however, with bidders milling around the floor, description at best is only of aggregates.

In markets that meet frequently with established traders, it is feasible that over time implicit or explicit collaboration or collusion could evolve, even with numbers such as ten or twenty. This is ruled out by assumption in a competitive market; but it raises the question of how many competitors are necessary before collusion can be ruled out.

The formal methods of the theory of games have been utilized since the 1960s to make these intuitively simple concepts precise (see Shubik 1984). Even today, however, in highly practical problems, such as information leaks and insider trading in the stock market, an
understanding of how to guarantee the appropriate conditions on information has not been reached.

Perfect competition is a useful ideal if it is not followed too slavishly. Possibly the closest approximation to it is provided by the New York Stock Exchange, where a reasonably close level of approximation to competition has been achieved through the building up of an enormous body of laws and regulations required to level the playing field in an actual market.

COMPULSORY VOTING
In order to be termed democratic, a regime must have certain characteristics. Even though political theorists debate the scope and depth of the characteristics of a democracy, there is a common understanding that certain minimum requirements comprise a democratic regime. In *Democracy and Its Critics* (1989), Robert A. Dahl identifies seven characteristics that should typically exist in a democracy. These are elected officials, free and fair elections, inclusive suffrage, right to run for office, freedom of expression, alternative information, and associational autonomy. The practices of these and similar characteristics vary from country to country. Inclusive suffrage is understood as a requirement, allowing citizens the opportunity to influence their government through voting, and universal suffrage is seen as a sufficient condition. In some regimes, however, inclusive suffrage has been made mandatory by the introduction of compulsory voting.

There are different levels of compulsory voting. In its simplest form, there are legal regulations according to which voting is compulsory. The regulations can be stated through a common law or they can be coded in the constitution of the country. Moreover, this legal obligation can either be sanctioned or remain a mere moral proclamation. Further, sanctions can either consist of economic penalties in the form of a fine or there can be other legal consequences. The legal consequences vary, from the voter providing a legitimate reason for his or her abstention to disenfranchisement to imprisonment, the most severe consequence. Although imprisonment is not generally enforced as a penalty, in theory a court of justice can impose imprisonment if the nonvoter has failed to pay the fine. In any case, compulsory voting should not be seen as a discrete variable, but rather as an ordinal scale with different levels of compulsion.

Regulations on compulsory voting are not very common. According to an estimate by *International Idea* (Gratschew 2002), only some thirty countries have regulations on compulsory voting and of these only eight enforce it strictly. These countries are Australia, Belgium, Cyprus, Fiji, Luxembourg, Nauru, Singapore, and Uruguay. Also in the canton of Schaffhausen in Switzerland compulsory voting is strictly enforced, whereas voting in the other Swiss cantons is voluntary. In any case, less than one-fifth of the world’s countries have any regulation on compulsory voting. Further, strictly enforced compulsory voting is a rarity; in less than 5 percent of all countries, compulsory voting is strictly enforced.

Compulsory voting has documented effects on voting behavior, particularly turnout. Strictly enforced compulsory voting boosts turnout, but also weakly enforced voting tends to increase turnout. However, merely a moral compulsion does not seem to affect turnout. Based on data from the Comparative Study of Electoral Systems,
Module 1, Pippa Norris in her book Electoral Engineering (2004) demonstrated that countries in which compulsory voting is strictly enforced have an average of 20 percentage points higher turnout than countries where voting is optional or where compulsory voting is not sanctioned in any way. Countries with weakly enforced compulsory voting systems fall in between, with an average turnout of 84 percent.

Compulsory voting tends to increase the number of invalid votes. Voters who do not have clear preferences but are still forced to the polls protest by voting blank or casting an invalid vote. According to David Farrell in his Electoral Systems (2001), the highest share of invalid votes in the 1990s was cast in Brazil, where the share was 19 percent. In Brazil, compulsory voting is weakly enforced.

Compulsory voting does not seem to contribute to a politically literate electorate. According to Kimmo Grönlund and Henry Milner in their article “The Determinants of Political Knowledge in Comparative Perspective” (2006), Belgium, a European country with a proportional electoral system and a multiparty system in combination with strictly enforced compulsory voting, deviates from its relevant European family in the dispersion of political knowledge. Political knowledge is highly dependent on the level of formal school education in Belgium, a pattern that is more typical for newly developed and developing countries, and not typical for European old democracies with proportional electoral systems.

Compulsory voting interferes with the logic of rational voting and abstaining. Since educated voting always involves personal effort, such as acquiring information and comparing parties’ policies, it is rational that many people do not want to vote. In his book Economic Theory of Democracy (1957), Anthony Downs deduced that if voting were costless only people with preferences would vote and people with no preferences would abstain. In a system with compulsory voting the odds that a single vote is decisive are less than in a system where voting is optional and some people always abstain. The incentives to form an informed electoral opinion in order to cast a vote are therefore low in systems with strictly enforced compulsory voting. Contrary to policymakers’ efforts to engage citizens politically by introducing compulsory voting, the system is more likely to increase the probability of uninformed and randomly assigned voting than to educate citizens. In the mid-2000s, however, there are no reliable comparative data on the effects of compulsory voting on political knowledge and informed voting.

COMPUTER SIMULATION
SEE Computers: Science and Society.

COMPUTERS: SCIENCE AND SOCIETY

For decades, pundits with scholarly credentials have been predicting that computer and information technology would radically transform both science and society. Ultimately, they may be right, but the apparent changes to date have been limited and often contradictory.

SOCIETAL IMPACT OF COMPUTING

It is often said that rationalization, mechanization, and computerization of work contribute to the degradation of skills and thus the demotion of the workforce. Yet the research has shown varying effects: In 1987 William Form reported that technology sometimes led to the loss of skills but at other times required increased skills. Surveying a
different large body of research, Jeffrey Liker, Carol Haddad, and Jennifer Karlin reported in 1999 that the consequences for work organization of new technologies are highly variable and contingent on a number of factors, including labor-management relations and the specific social process through which the technology was developed and introduced. Information technology has long been considered a tool that large corporations use to control their workers and governments use to monitor their citizens. This is true both in the United States, where much of the information technology has been developed, and in countries into which such technologies have been introduced, despite their very different social conditions. In 1977 Philip Kraft argued that corporate desires for control over employees led to routinization and fragmentation even of the profession of computer programming itself, with a consequent loss of innovativeness.

Perhaps ironically, 1977 was also the year in which the first really successful personal computer, the Apple II, was introduced, created by a tiny company started by two friends in a garage. Since that time computer innovation has resulted in a remarkable scenario: Visionary individuals develop a prototype of an innovation and found a start-up company, which either becomes a major corporation overnight or is purchased for millions of dollars by an existing major corporation. In many cases, such as Google and the first Web browsers, the innovators were graduate students who received government support from grants to their professors who were working on something only indirectly related.

In 1973 the sociologist Daniel Bell proclaimed "the coming of post-industrial society," a new form of information-intensive society that would be marked by five primary features:

1. Economic sector: the change from a goods-producing to a service economy.
2. Occupational distribution: the preeminence of the professional and technical class.
3. Axial principle: the centrality of theoretical knowledge as the source of innovation and of policy formulation for the society.
5. Decision making: the creation of a new "intellectual technology."

In such a postindustrial society, social scientists and information scientists might have been expected to enjoy great prestige and their profession to have achieved a position of dominance. Yet in the United States, where modern information technology largely arose, almost the opposite has occurred. Since 1982, when the Reagan administration sought to eradicate social science from the National Science Foundation and did succeed in cutting budgets to 40 percent of their prior levels (and cutting all budgets for social scientists; Larsen 1992), the influence of social scientists (other than economists and, rarely, demographers) on American policies has been insignificant. During the Clinton administration of the 1990s, there was a brief government flirtation with social science as applied to the Internet, before the second Bush administration ended it.

The so-called digital divide was the subject of much discussion in the mid- to late 1990s. The term refers to the tendency of disadvantaged groups to have less access to the Internet, and thus to information in general, than other more privileged groups. When numerous studies found this digital divide in schools as well as in the adult world, some voiced concerns that computers, though they might have the potential to reduce socioeconomic inequality, were actually increasing it. By this logic, government should invest in Internet-related technologies as a fundamental solution for social problems stemming from poverty and lack of opportunities for education. Once most middle-class households hooked up to the Internet on home computers, the novelty of the issue faded, and unequal access to information came to be taken for granted.

Internet and other modern computer technologies raised ethical issues that were mostly updated versions of old ones—for example, product liability, with software manufacturers forcing customers to agree to licenses in which the producers promised nothing. Some of these ethical issues may be more acute in the information context, notably those concerning privacy and intellectual property rights, but they are not unprecedented. An extended debate has raged over whether computers degrade social relationships in society, enhance them, or merely provide a new environment in which they may take place. As Leah Lievrouw (2003) has observed, the Internet has become contested territory on which individuals and small groups assert their autonomy, major corporations monopolize attention and attempt to criminalize activities that threaten profits, and activists launch counterattacks against corporate tyranny. This is seen not only with respect to file sharing of music, but also blogs revealing government or corporate secrets, posting of programs called "mods" (modifications) that alter commercial software, and coopting commercial chatrooms to organize radical cultural, political, sexual, and economic networks.

Ray Kurzweil, among the most influential computer entrepreneurs and visionaries, argues in his 2005 book that technology is driving humanity toward a singularity, utterly transforming human life during the present century. He raises the possibility that humans may no longer
be limited to biological bodies but dwell within robots or computers, and that artificial intelligences will surpass human intelligence. Whatever one thinks of this extreme possibility, Kurzweil suggests an interesting principle that puts all such prognostications in context: People tend to overestimate the near-term impact of a technological revolution and to underestimate the long-term impact. Social scientists have tended to stumble along these lines, asserting that the computer revolution has arrived but not contemplating where and when its greatest impacts will be felt.

**IMPLICATIONS FOR SOCIAL SCIENCE**

Arguably, the computer revolution began for social science at the beginning of the twentieth century, when Hermann Hollerith developed programmable, punch-card counting machines to analyze data from the 1900 U.S. census and founded what later became the IBM corporation. Thus social-science computing is a mature field, yet many promising computer methods are underused in the social sciences.

After decades of development, computer simulation still has only a marginal position in most of the social sciences. In 1974 Donella Meadows and colleagues published a dire and influential warning about the human future, called The Limits to Human Growth, based on computer simulations of the global socioeconomic system; but three decades later social scientists were still debating whether the approach has merit. A number of social scientists with classical training have taken up computer simulation as a methodology for developing theory and testing its logical consistency. For example, William Bainbridge (2006) used a system of 44,100 artificial intelligent agents to model the way that religious cognitions and social influences interact in a community the size of a small city. But much of the simulation work on human societies ignores traditional work on the same topics, thereby failing to integrate the simulation community with the rest of social science. A striking but not unusual example is the otherwise excellent textbook, *Simulation for the Social Scientist* (2005), by Nigel Gilbert and Klaus Troitzsch, which cites in its extensive bibliography almost none of the simulation studies published in mainstream social science journals.

The general field of human-centered computing (HCC), including the subfields called human-computer interaction (HCI) and computer-supported cooperative work (CSCW), has become major research territory, although a large fraction of the scientists come from outside the classical social sciences, and very little of this work is published in mainstream social science journals. The goal of these HCC researchers is generally to develop or evaluate hardware or software systems, rather than test general theories, and their methodologies rarely meet social science standards of rigor. This “wild west phase” in the history of HCI and CSCW may be coming to an end, as evidenced by the papers presented at the international Communities and Technologies conferences that tend to cite a good mixture of traditional social science along with computer science work on Internet-based communication networks.

Although every social scientist today uses Internet search engines, few seem to realize that they are versatile tools for social analysis, and that other potentially useful tools can be found on commercial Web sites. A Web search engine needs not only to find Web sites that contain a particular word, but also to arrange the Web sites in descending order of probable value to the user, on the basis of natural language processing (NLP) and analysis of the network of links connecting Web sites. These methods could be used by social scientists to map the culture and society that produced all the Web sites. Business sites, such as Amazon and Netflix, include recommender systems (or collaborative filtering systems) that create advertisements personally tailored for the individual user, based on the buying patterns and expressed preferences of previous customers. Applied, for example, to books about politics, these methods could tell political scientists much about how citizens view leaders and issues. Even as social scientists study the impact of information technology on the rest of society, they should contemplate how it might transform their own disciplines, for good or ill.

**BIBLIOGRAPHY**

Auguste Comte was a French philosopher best known for founding the field of sociology and the philosophical school of positivism. Born into a Catholic and monarchical family in Montpellier on January 17, 1798, he rejected Catholicism and royalism at the age of thirteen and entered the progressive École Polytechnique in Paris three years later. He soon began a close association with the French social reformer Claude Henri de Rouvroy Saint-Simon (1760–1825) and served as his secretary for several years. After breaking with Saint-Simon and then suffering a mental collapse in 1827, Comte recovered and published the six volumes of his seminal *Course of Positive Philosophy* between 1830 and 1842. He also served as a tutor and examiner at the École Polytechnique beginning in 1832, but was dismissed in 1842 as a result of a dispute with its directors. He had gained a considerable following by this point, and for much of the remainder of his life his admirers and disciples supported him financially. In the early 1850s he began formulating his own humanitarian and non-theistic religion, the Religion of Humanity. His second and final major work, the four-volume *System of Positive Polity*, was published from 1851 to 1854. Soon afterward Comte's perennially poor health deteriorated even further, and he died of stomach cancer on September 5, 1857.

Comte is perhaps most famous for his “law of three stages,” according to which intellectual and social development progresses through three chronological steps: the theological stage, in which events are attributed to the actions of gods and supernatural forces; the metaphysical stage, in which the world is explained through abstract concepts such as “nature” and “final causes”; and the final, positive stage, which is characterized by a willingness to simply observe the world without searching for a metaphysical cause or final principle that governs it. Comte believed that the “positive” method that had triumphed in mathematics, astronomy, and physics would eventually prevail in other fields such as economics and politics; this belief system made him an important forerunner of positivistic social science as it emerged in the mid-twentieth century, which held that mixing “facts” and “values” would entail a betrayal of scientific thinking. According to Comte, the positive method would culminate in a new science, sociology, the goal and achievement of which would be nothing less than the synthesis of all human knowledge and the resolution of the crisis of the modern world through the reorganization of society.

Comte maintained that nearly all social problems could be solved by organizing society into an all-embracing hierarchical system in which an intellectual elite helps to regulate education and public morality, an outlook which the English biologist Thomas H. Huxley (1825–1895) described as “Catholicism minus Christianity” (Pickering 1993, p. 17). The English philosopher John Stuart Mill may have overstated the case in arguing that Comte aimed at establishing “a despotism of society over the individual, surpassing anything contemplated in the political ideal of the most rigid disciplinarian among the ancient philosophers” (Comte 1975, p. xxviii), but it is difficult to deny that Comte’s emphasis on hierarchy and obedience put him sharply at odds with liberalism and democracy.

CONCENTRATION CAMPS

The concentration camp has become a paradigmatic symbol for oppression of the racial or ethnic “other.” The Oxford Dictionary defines a concentration camp as “a camp where non-combatants of a district are accommodated.” While this definition captures the basic description it does not articulate that concentration camps have become synonymous with starvation, rape, torture, violence, and mass extermination. Some camps also involve forced labor in addition to the other forms of inhumane treatment. Many states—Western and non-Western, democratic and undemocratic—have used concentration camps as tools to target civilian populations and hated ethnic groups. The justification for camps has generally been to cleanse the society of perceived internal threats to security and order. In most cases a distinct ethnic group or class of people is determined to be a threat and subject to internment by state decree in order to guarantee stability and prevent insurgency. Thus the development of concentration camps is driven in its earliest form as a counter-insurgency technique against anticolonial struggles.

The first use of concentration camps was by the British during the Boer war (1899–1902). Boers and black Africans were placed in camps so that they would be unable to aid Boer guerrillas. It is reported that more than 27,000 Boers and 14,000 Africans died in the camps from disease and starvation. Most of the dead were children, clearly noncombatants in the conflict. The British also employed the use of concentration camps in Namibia, the Isle of Man, Cyprus, Kenya, Channel Islands, and Northern Ireland. In Kenya during the Mau-Mau rebellion the British placed 1.5 million Kikuyu rebels in concentration camps. More than 300,000 Kenyans died as a result of these policies. These cases make it clear that even when concentration camps are not explicitly designed to exterminate large portions of the enemy population they are no less deadly in their effect.

Camps have almost always been justified by and surrounded conflicts whether civil or international. Some of the most notable examples have surrounded multinational conflicts like World Wars I (1914–1918) and II (1939–1945). During World War I, Austria-Hungary placed Serbs and Ukrainians in concentration camps during the war. However, the most prominent examples emerge from the experience of World War II.

The experience of Nazi Germany in World War II stands as the paradigmatic example of concentration camps. The Nazi government led by Adolf Hitler and an ideology of cleansing the German nation and controlled territories of Non-Aryans, developed camps for mass extermination and forced labor. The primary groups targeted by Germans were Jews from Germany and territories occupied by Germany during World War II like the Netherlands, France, and Poland. However, while the Nazi camps are known for their extermination of Jews they were not the only populations placed in camps. Nazis also placed the Roma (Gypsies), Africans, homosexuals, and communists in camps for forced labor and extermination.

The Nazi camps first began in 1933 largely for internment but were converted to the cause of extermination in 1941. Evidence shows that more than six million Jews and some unknown others perished in the Nazi camps of Treblinka, Belzec, Auschwitz-Birkenau, and Sobibor. Methods of extermination included starvation, gas chambers, disease, and firing squads. According to some sources groups of individuals were used at times as target practice for German soldiers.

The Nazi concentration camp spawned immense creativity and social scientific work. Psychologist Viktor Frankl developed his psychological perspective called logotherapy based upon his experiences in Auschwitz and Dachau. Italian theorist Giorgio Agamben has developed theories around the state of exception and the bare life to see the concentration camp as a product of modern state sovereignty rather than as an aberration. Italians also placed Jews and communists into camps during World War II and camps also existed in the Netherlands and France.

However, Germany and Italy were not the only nations to use internment during World War II. The United States put ethnic Japanese, many of who were American citizens, into what were called internment camps beginning in 1942. This action was undertaken by the Roosevelt administration under executive order 9066 following the bombing of Pearl Harbor by Japan in December of 1941. More than 120,000 Japanese Americans and some German Americans, two-thirds of whom were U.S. citizens, were placed in internment camps. Lt. General J. L. DeWitt wrote in a letter to the Chief of Staff, U.S. Army, June 5, 1943, that, “The security of the Pacific Coast continues to require the exclusion of Japanese from the area now prohibited to them and will so continue as long as that military necessity exists” (p. vii).

Many Japanese died or suffered poor health and neglect in the camps. In order to leave the camps young men had to swear allegiance to the United States and agree to enter the U.S. military. Many refused and were punished, and their stories are captured in the novel The No, No Boys (1978)[MS1] referring to their decline of swearing allegiance to the U.S. and their decline of military conscription. In 1988 the U.S. Congress formally apologized to Japanese American victims of internment camps and granted reparations to the group according to the Japanese-American Reparation Act.
Japanese internment is not the only instance in the United States of the perceived use of what many identify as concentration camps. The practice of placing Native Americans on Indian reservations that had few services and little or no economic opportunities has been likened to the practice of concentration camps. The Native American experience begins with the Indian Removal Act of 1838, which relocated Southern tribes east of the Mississippi River and set the stage for moving them to reservations. Others like Stanley Elkins in his work on slavery compared slave plantations to concentration camps.

In the twenty-first century the detention and torture of terror suspects and so-called illegal combatants outside of the Geneva conventions at “Camp X-Ray” in Guantanamo Bay, Cuba, has been likened to concentration camps. Detainees have been subjected to a range of forms of extralegal torture that do not conform to the Geneva Conventions or other international law.

Latin America has not been free from the experience of concentration camps. The military junta in Argentina used camps to torture and kill more than 30,000 disappeared dissidents between 1976 and 1983 during what is called the “Dirty War.” The military regime of Augusto Pinochet (1915–2006) in Chile also used similar camps to deal with dissidents during its reign following the coup against democratically elected leftist President Salvador Allende (1908–1973).

Between 1895 and 1898 the Spanish in Cuba employed camps to combat the insurgents fighting for Cuban independence. The atrocities in the camps, the bombing of the Maine, as well as the imperialist designs of the United States are cited as reasons the United States invaded Cuba in the Spanish-American War (1898). The Spanish also used camps in the Philippines in 1901 to quell descent against colonial rule.

Other uses of the concentration camp have involved the Khmer Rouge regime headed by Pol Pot (1925–1998) in Cambodia, North Korea, and the Peoples Republic of China reform and labor camps. The camps in Cambodia caused the deaths of 1.7 million enemies of the Khmer Rouge (1975–1979); the camps in North Korea held 1.6 million enemies of the state (1948–1994); and countless millions in the camps in China developed during the Great Leap Forward and the Cultural Revolution (1958–1961 and 1966–1969). In each case, these were communist regimes that used camps to “reform” political dissidents or those who were perceived to be ideological or ethnic enemies of the regime. In each case, thousands died in camps from starvation or from overwork or were executed. Soviet leader Joseph Stalin (1878–1953) used concentration camps called gulags to address political dissenters, Jews, and other ethnic groups in Russia. These camps included Trotskyite political foes, and ethnic Ukrainians, Chechens, Ingush, Crimean Tartars, Tajiks, Bashkirs, and Kazaks.

One of the more recent experiences with concentration camps was the Balkan War, following the break-up of Yugoslavia. In Bosnia and Herzegovina between 1992 and 1995 more than 200,000 Croats, Serbs, and Muslim were killed in camps and by acts of ethnic cleansing.

The widespread use of concentration camps for social scientists demonstrates the willingness of various kinds of states in different contexts to engage in this harsh form of population regulation. The camps themselves demonstrate the extensive power of modern states to regulate all aspects of everyday life for citizens and other populations contained within national, colonial, or imperial boundaries. Camps have also provided opportunities to understand the psychology of the oppressors and the oppressed. The concept of authoritarian personality was developed in part to understand the participation of regular Nazi soldiers in the extermination of Jews. Further, the works of Stanley Elkins, Avery Gordon, Agamben, and Frankl, among others, examine the effects of camps on individuals and groups. Beyond psychology, notions of collective memory and haunting have also been developed to analyze the way the experience of concentration camps structures the lives and memories of generations beyond the initial victims. Concentration camps are a devastating product of modern nation states and civil and international military conflicts. At the same time, they are a rich but disturbing area of study for those who seek to understand the role of the state and the psychology of violence and oppression.

CONDITIONALITY

Conditionality is the practice used by international financial institutions (e.g., the International Monetary Fund and the World Bank) and bilateral donors to link their provision of financial support to developing and middle-income countries to the implementation of prespecified policy reforms.

Conditionality has its origins in the Articles of Agreement of the International Monetary Fund (IMF), adopted at the United Nations Monetary and Financial Conference in Bretton Woods, New Hampshire, in 1944, and amended several times since. The Articles of Agreement state that one of the purposes of the IMF is to provide temporary balance-of-payment support to countries that need it under "adequate safeguards" that the loans will be repaid (Article I(v) of the IMF Articles of Agreement). Since the early 1950s, these safeguards have been achieved through the imposition of specific policy conditions, set out in the stand-by arrangements negotiated by the IMF with countries receiving its support. These conditions were designed to ensure that the recipient country adopted macroeconomic policies that would allow it to be in a position to repay the foreign exchange funds lent by the IMF in the foreseeable future. Conditionality therefore acted as a substitute for the collateral used to guarantee loans between private companies.

The nature of conditionality has evolved since the early practice of the IMF. Initially, conditionality only included macroeconomic policy reforms aimed at addressing the external disequilibrium experienced by the recipient countries (e.g., reduction in domestic absorption, policies to promote exports). In the 1970s and 1980s conditionality became more extensive, and included structural conditions too (e.g., privatization of state-owned entities), in order to address larger balance-of-payments crises. Moreover, donors other than the IMF (most notably the World Bank) started to impose conditionality too, to ensure that their project lending would take place in a sound policy environment. Conditionality is still being used by the IMF in its support of middle countries experiencing significant currency crises (e.g., several East Asian countries in the late 1990s and Argentina from 2000 to 2002) and by all donors that lend money or give grants to developing countries. Conditionality applies to a wide variety of policy areas (including governance), even though donors are seeking to streamline its use.

Conditionality has been frequently criticized for its lack of effectiveness. One area of criticism relates to the type of orthodox economic policies (e.g., sharp reductions in expenditures and tight monetary policies) typically demanded by donors through conditionality. Critics have seen these policies as ineffective in stimulating growth and reducing the social costs from adjustment.

The second reason why conditionality has been seen as not effective is because of its lack of credibility. Countries receiving donor support can often anticipate that even if they do not fully implement the policy reforms demanded under conditionality, they will still receive support from the donors. This is because donors may have an interest in providing support even if conditionality is not adhered to, due to, for example, geopolitical considerations, pressure to spend aid budgets, and the need to ensure the repayments of past loans. This undermines the effectiveness of conditionality, leading only to partial implementation of the policy reforms demanded by donors in return for financial support.

CONDORCET, MARQUIS DE

1743–1794

Marie Jean Antoine de Caritat, Marquis de Condorcet, a descendant of the ancient family of Caritat, was born on September 17, 1743, at Ribemont, Aisne, in France. His father died early, and Condorcet’s devoutly Catholic mother ensured that he was educated at the Jesuit College of Rheims and at the College of Navarre in Paris. A talented young mathematician, he soon came to the attention of the mathematicians Jean le Rond d’Alembert (1717–1783) and Alexis Clairault (1713–1765). In 1765 Condorcet published a work on mathematics entitled...
Confederate States of America

Essai sur le calcul intégral (Essay on Integral Calculus), and he was elected to the Académie Royale des Sciences four years later. After becoming acquainted with Anne Robert Jacques Turgot (1721–1781), who served as controller-general of finance under King Louis XV (1710–1774), Condorcet was appointed inspector general of the Monnaie de Paris (Paris Mint) in 1774. Condorcet later wrote a sympathetic Life of Turgot (1786), which supported Turgot's economic theories. In 1777 Condorcet was appointed secretary to the Académie des Sciences; in 1782 he became secretary of the Académie Française; and in 1789 he published his Life of Voltaire. Thomas Malthus's (1766–1834) Essay on the Principle of Population (1798) was published partly in response to the optimistic views on the perfectibility of society that Condorcet expressed in his writings.

Condorcet remains influential in the social sciences because he applied mathematical ideas to social and political problems. He became famous for what is now known as Condorcet's paradox, first presented in his Essay on the Application of Analysis to the Probability of Majority Decisions (1785), which describes the intransitivity of majority preferences in electoral politics. An election can occur even when there is no clear candidate whom the voters prefer to all other candidates. In such a situation, known as a majority rule cycle or circular tie, one majority prefers candidate A over B, another majority B over C, and a final majority C over A. To break such electoral circles, Condorcet invented a method in which voters rank candidates in order of preference; these electoral procedures are known as the Condorcet method, which is designed to secure a definite Condorcet winner.

Condorcet played a leading role in the French Revolution of 1789. In 1791 he was elected to represent Paris in the Legislative Assembly, where he presented plans for the creation of a state education system and drafted a new constitution for France. He also campaigned for the abolition of slavery and advocated female suffrage, publishing a pamphlet titled “On the Admission of Women to the Rights of Citizenship” in 1790. Although he was a revolutionary, he did not support the execution of the French king, and aligned himself with the more moderate Girondist Party. He opposed the so-called Montagnard Constitution, which he thought was too radical and far-reaching. As a result, he was regarded as a traitor and a warrant was issued for his arrest. While in hiding, Condorcet wrote his famous Sketch for a Historical Picture of the Progress of the Human Mind, which was published posthumously in 1795. This major text of the French Enlightenment describes the historical connection between the growth of science and the development of human rights.

In March 1794 Condorcet attempted to escape from Paris, but he was arrested and imprisoned, and was later found dead in his cell; the cause of his death has never been determined. Condorcet was interred in 1989 in the Panthéon in Paris in honor of the bicentennial of the French Revolution.

CONFEDERATE STATES OF AMERICA

The Confederate States of America was officially founded in February 1861, after seven Southern states (South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas) seceded from the United States. For years, Northern and Southern states had been debating the issue of slavery, especially in the territories, where it was not constitutionally protected. These debates had escalated during the 1850s, sometimes to the point of violence. When Abraham Lincoln, who represented a specifically antislavery party and wanted to end slavery in the territories, was elected president of the United States in 1860, these seven states declared they had had enough and left the Union.

They quickly went to work forming a provisional government. Shortly after announcing the new country, the Confederate Congress appointed Jefferson Davis president (he would be officially elected to office in November). It named Montgomery, Alabama, as the new nation's capital, and it adopted a constitution. This constitution was modeled largely on the United States Constitution (Confederates, like their Northern brothers, insisted they were the true heirs of the Founding Fathers) with several important exceptions. Where the federal Constitution had never used the words slave or slavery, but implicitly protected the peculiar institution, the Confederate document explicitly protected slavery—even deeming that Congress could pass no law that would impinge on “the right of property in negro slaves.” Unlike the Americans, however, the Confederates immediately banned the international slave trade, except with states remaining in the Union. The president served a six-year term, and he could not be reelected. He also had the right to a line-item veto.
When fighting broke out with the Union in April, four more states (Virginia, Tennessee, North Carolina, and Arkansas) joined the Confederacy. In an acknowledgment of Virginia’s importance, Confederate leaders quickly agreed to move the capital to the industrial and commercial city of Richmond. For the South in particular, this decision made Virginia the military focal point of the war. Because the Confederate leadership did not have the sense of urgency about the West that it did about Richmond, less able generals were often in command there, and the rebels suffered loss after loss.

War dominated the life of the Confederacy. Leaders at the state and national levels were constantly challenged with the problem of keeping the ranks filled and with feeding and clothing the army. The country had 5.5 million whites and about 3.5 million black slaves who would not be allowed to serve. By 1862 Confederates were so desperate for men that they resorted to a national draft. This was a deeply ironic development in a country that had embraced individual liberties and states’ rights as being among its banner causes. Meanwhile, a successful Union blockade and the lack of internal infrastructure complicated efforts to procure and transport needed supplies. (The same issues made it exceedingly difficult for Southerners to export their main commodity, cotton.)

Financing the war was another problem, one that Confederates never mastered. Relying principally on loans and the printing press to pay for the war, the government helped drive inflation through the roof. Congress passed a comprehensive tax measure in 1863, but the government did not effectively enforce it, and so it made little impact. Over the course of the war, prices increased by a factor of more than 90.

The stresses of war had profound effects at home. Rising prices, shrinking availability, speculation, and a drought in 1862 meant that civilians started to go hungry that year. By the following spring, bread riots were breaking out, including one on April 2, 1863, in Richmond that Davis personally broke up. Hoarding and price gouging only compounded matters, and concern for starving families led many Confederate soldiers to desert, especially in the last year of the war. Meanwhile, war itself forced many families into flight. The presence of federal armies also prompted many slaves to abandon their masters and run to the safety—and freedom—of Union lines.

A prickly micromanager, Davis was unable to lead the nation effectively. He had a running argument with more than one general (Robert E. Lee was the only general to whom he regularly deferred), and his cabinet was a revolving door (he had five secretaries of war, for instance). He never reached out to members of Congress or the press, and was barely on speaking terms with his own vice president, Alexander Stephens. Davis had repeated tussles with various governors, particularly Joseph Brown of Georgia and Zebulon Vance of North Carolina, both of whom resisted what they believed were Davis’s encroachments on states’ rights. In fairness, Davis’s management troubles were not entirely of his own making. The one-term rule set out by the constitution rendered Davis a lame duck from the moment he stepped into office. Historians widely believe that the lack of political parties in the South, which blamed partisanship for many of its antebellum fights with Northerners, meant that criticism against Davis was not channeled and came at him from every angle. Without partisan machinery and the attendant patronage, Davis had no way to punish his enemies or reward his supporters.

By the end of the war, the Confederacy was a tangle of contradictions. In a nation founded partly on the principle of individual liberties, Davis suspended habeas corpus and declared martial law in some parts of the country, while Congress passed the first conscription measure in what had been the United States. In a country that was predicated on states’ rights, the federal government had to consolidate power at the expense of the states in order to prosecute the war. And in the most striking irony, this state that had been founded to protect slavery decided in March 1865 to arm slaves in a last-ditch effort to hold off the Northern armies. The policy could not be implemented, however, before Lee surrendered to General Ulysses S. Grant on April 9, 1865. Although it took some time for news of the war’s end to reach the far corners of the Confederacy, for all intents and purposes the Confederate States of America died with Lee’s army.

In the 1870s, Southern white women in particular set out to venerate their fallen men and the Old South. In doing so, they created what has come to be known as the Lost Cause mythology, a moonlight-and-magnolias view of the slave-owning South and the Civil War. The central ideas behind the Lost Cause are that the Confederacy lost the Civil War because the North overwhelmed it with superior numbers, not better fighting, and that defeat ennobled the South rather than discredited it. This ideology is evident in various monuments, works of fiction, and film, with the most notable and culturally penetrating work being Gone with the Wind.

CONFEDERATIONS

A confederation is a voluntary association of sovereign, independent nations-states or political communities that manages, in limited ways, its members’ common concerns, such as defense, foreign relations, trade, postal services, and a common currency. A confederation, therefore, ordinarily entails cooperative unity across a broader range of governmental functions than a customs union in which the member nations eliminate trade barriers among themselves and implement a common tariff policy toward nonunion nations.

The word federal comes from the Latin foedus, meaning “covenant,” which signifies a partnership or marriage wherein individuals or groups consent voluntarily to unite for common purposes without surrendering their fundamental rights or identities. The verb confederate has traditionally meant to form an alliance to carry out the will of a coalition of interests, none of which relinquish sovereignty.

Commonly cited examples of confederations include the Aetolian (367–189 BCE) and Achaean leagues (280–146 BCE) of ancient Greece, the Iroquois Confederacy in North America (c. 1142–1794), the Swiss confederations (1291–1798 and 1814–1848), the Polish-Lithuanian Commonwealth (1569–1795), the Dutch Republic (1589–1795), the Articles of Confederation of the United States (1781–1789), the Germanic Confederation (1815–1866), and the southern Confederate States of America (1861–1865).

Before the framers of the U.S. Constitution invented modern federalism in 1787, the word federal referred to what is today called confederal. The U.S. founders transformed the historic concept of federalism as confederation into the modern concept of federation, thus generating today’s widely held view that confederations are weak, even outmoded. Indeed, most modern confederations have been short-lived. Recent examples include the United Arab Republic (1958–1961), the West African union of Senegal and the Gambia (Senegambia, 1982–1989), and the State Union of Serbia and Montenegro (2003–2006) in southeastern Europe.

Confederations established before the 1700s sometimes lasted for several centuries, but confederations established since the 1700s have usually lasted less than a decade, in part because the modern nation-state and its attendant nationalism militate against merely confederal unity. Additionally, the complexity of modern governance strains the capabilities of confederations, while the availability of alternate means of functional cooperation, such as military alliances and trade agreements, render confederations less necessary. These problems are illustrated by the Commonwealth of Independent States (CIS), a quasi confederation established in 1991 by twelve successor states of the Union of Soviet Socialist Republics. Although the CIS still exists in form, it is weak, fractious, and pockmarked by separate alliances and agreements among subsets of its members.

A confederation is usually established by, and based on, a written document called articles, a convention, a treaty, or some other term. The document states the confederation’s purposes, terms, structure, procedures, and specific powers. Attributes of sovereignty are not usually vested in a confederation; individuals retain citizenship in the separate member states; and member states can exit the confederation. Hence, a confederation usually possesses only limited, expressly delegated powers, and can exercise only those powers explicitly stated in the founding document. It cannot increase its powers through interpretation.

An important, common difference between a federation and a confederation is that a confederation usually cannot legislate for individuals. Consequently, the confederal government under the U.S. Articles of Confederation could not tax, fine, arrest, or regulate individuals, or conscript citizens of the constituent states into the confederal military. Ordinarily, a confederation can act only through its member states. Also, it possesses no independent sources of revenue to support its operations; instead, it must rely on contributions or dues payments by its member states.

All member states ordinarily have equal representation and one vote each in the confederation’s decision-making council. The representatives are usually appointed and also paid by their member governments rather than being elected by the people of the member states and paid by the confederal government. Thus, the members of a confederal council are more like ambassadors than representatives. Frequently, majority voting is rejected in favor of supermajority and unanimous voting.

There is no precise, universal definition of confederation or exact distinction between confederation and federation because confederations, as well as federations, vary in their characteristics. Attributes of confederation and federation get mixed together in response to political cir-
cumstances. For example, Switzerland’s constitution is titled the Federal Constitution of the Helvetic (or Swiss) Confederation. The European Union’s (EU) core decision-making structure is confederal; yet, many of its operational features are federal. The EU is a hybrid—a confederal federation—that has endured because its confederal features guarantee the continuing authority and integrity of the member states, while its evolving federal features guarantee the operational viability of the union within its limited but gradually growing sphere of authority.

CONFISCATION

Legislation enabling courts to confiscate or remove illegal gain has grown rapidly in a wide range of both civil and common-law countries. The concept is not new: forfeiture was part of Roman law as early as 451 BCE and was also used by the ancient Greeks. In more recent times, confiscation has usually been introduced as a part of the fight against organized crime and drugs, either directly in drugs legislation or in a penal code and applicable to all kinds of crimes. In 1970 the U.S. Congress passed the first criminal forfeiture statutes in U.S. history. In the United Kingdom forfeiture was introduced in the Drug Trafficking Offences Act 1986 and has been subsequently strengthened and extended to other areas of crime via the Criminal Justice Act 1988 and 1993, the Drug Trafficking Act 1994, and the Proceeds of Crime Act 2002. In other countries the sanction of removing illegal gain has been introduced for a wide array of crimes, extending even to environmental statutes.

The power of courts to impose this sanction varies substantially across areas of the law and also across jurisdictions. In some countries, such as the United States, the proceeds of drug trafficking can be forfeited under civil powers, independent of any criminal proceedings. Although in the United States forfeiture is technically considered to be a civil sanction, the Supreme Court has recognized that forfeiture constitutes a significant punishment and is thus subject to constitutional limitations under the Eighth Amendment. In other countries, such as the United Kingdom, the confiscation of such assets is only possible as a subsidiary part of criminal proceedings.

The goal of removing illegal gain, according to legal doctrine, is to achieve restitutio ad integrum. This means that criminals should be put back in the situation in which they would have been had the crime not been committed. This corresponds to the general notion that crime should not pay. This restitutive goal may not be fully achieved with the imposition of other sanctions, such as fines or imprisonment: A fine may well be much lower than the profit from an offense, and imprisonment is no guarantee that the offender will be left without the profits of a crime. For offenses such as theft, the offender can be required to return stolen goods or to pay compensation to the victim of the crime. But for so-called “victimless crimes” such as environmental pollution or drug trafficking, the harm caused by crime is experienced by society at large rather than by identifiable victims, in which case the confiscation of illegal gain replaces individual compensation.

The goal of providing restitution through confiscation also has important consequences for legal character. Confiscation is not usually considered a criminal sanction, as is a fine or imprisonment, but a measure. (There are exceptions to this, however; in France confiscation may be a supplement to a penal sanction or, in some cases, even the primary sanction.) Measures are designed to be correc-
Confiscation occurs after a crime has been committed and thus has little to add by way of deterrence, assuming the courts are applying efficient sanctions that already take illegal gain into account. But if the courts have been applying fines that exclude illegal gain, then a role for confiscation may emerge. Bowles, Faure, and Garoupa (2000, 2005) have argued that there are certain types of offense for which the removal of illegal gain provides a punishment superior to more traditional sanctions. Offenses committed sequentially and where the victims are unaware of offenses being committed may be very difficult (and costly) to detect. For example, a drug dealer may accumulate wealth from a large number of small illegal transactions, or a polluting firm may discharge illegal effluent over a prolonged interval. In such instances it is impracticable to prosecute each illegal action individually. Confiscation can be a way to tie sanctions more closely to an offender's cumulative ill-gotten gains and to increase the scale of sanctions. This can help compensate for weak deterrence in crimes such as illegal trading, where conviction probabilities are low and the fines imposed are low in relation to the potential gains.

CONFLICT

In general usage, a conflict is a disagreement or incompatibility of goals. In conflict resolution literature, however, conflict is distinguished from dispute, with the former being a long-term, deep-rooted problem, and the latter being a short-term, more superficial difference that can usually be resolved through simple negotiation. Conflicts, in this sense, are often caused by attacks on, or the absence of, basic human needs, especially identity, security, and a sense of self-worth. Most conflicts between ethnic groups, for example, are of this type. One group may threaten the legitimacy and value of another's identity, or it may attack or threaten them physically, psychologically, socially, economically, or politically, thereby causing a conflict.

Conflicts can also be caused by disagreements about fundamental moral values (e.g., definitions of right and wrong). In the United States, the conflicts over abortion rights, homosexual marriage, and the role of Christianity in public affairs are all examples of such value conflicts.

Finally, conflicts can involve disagreements about rights or denial of rights. These can include fundamental human rights, which are laid out in the Universal Declaration of Human Rights, or they can be more narrowly defined in national or state constitutions or laws, or in local ordinances. In all of these cases, the problem is not easily negotiable: people do not negotiate about their religious beliefs, nor do they compromise their basic rights. They fight for them.

Disputes, on the other hand, are often differences of interests: who is going to do what and when, how much someone will pay for something, or how a limited good will be distributed. Such disputes are usually negotiable, and a so-called win-win, or integrative, solution can often be found through which everyone is satisfied and the dispute is resolved.

Politics, being about the distribution and use of power, is inherently conflictual. It could be argued that all politics is conflict and conflict resolution, because it involves the processes used to determine who has power to make decisions and to prevail in disputes at the family, organizational, community, national, and international levels. At all of these levels, institutions have been developed to routinize the management of such disputes: families may use a consensus process or one of parental control; organizations have management policies and procedures; communities, nations, and even the international system have laws, legislatures, executive branches, and courts. All of these institutions are designed to resolve conflicts over who will do what, what rights people have, and even what moral codes will be followed (as, for instance, with abortion laws).

In general, these mechanisms work fairly well, and most conflicts are successfully prevented or resolved. Sometimes, however, established mechanisms break down and destructive and protracted conflicts develop. These may take the form of domestic violence or protracted family disputes between spouses or between parents and children. Also common are long-running conflicts within organizations over such topics as who will lead, what goals will be pursued, or how work is to be accomplished. When routinized conflict resolution mechanisms break
down at the national or international level, insurgencies or overt war is often the result.

CONFORMITY
Ever since Émile Durkheim (1858–1917), considered one of the founders of sociology, conformity has often been discussed in sociology as a solution to the problem of social order. The basic norms and values in a society are internalized through the process of socialization. This process results in conformity, which contributes to keeping society together without resorting exclusively to external force or violence. These ideas were further developed by sociologists Talcott Parsons (1902–1979) and Robert K. Merton (1910–2003), among others, and became highly influential during the mid-twentieth century. For Merton two elements of the social and cultural structure of society are of particular importance: culturally defined goals, purposes and interests, which function as legitimate objectives that define what is “worth striving for”; and institutionalized norms that regulate “the acceptable modes of reaching out for these goals” (Merton 1957, pp. 132–133). Only so far as an aggregate of people conforms to such values and norms may we call it a society, according to Merton; people who reject both the cultural goals and institutional means of a society are “strictly speaking in the society but not of it” (Merton 1957, p. 147). Non-conformers are likely to be met by a variety of negative sanctions, formal as well as informal, which will put pressure on them to change their behavior, if not their beliefs.

INTERNAL AND EXTERNAL CONFORMITY
When discussing conformity it is important to bear in mind the distinction between conformity in beliefs or attitudes and conformity in behavior. People may conform behaviorally without giving up privately held deviant beliefs in order to escape negative sanctions or be rewarded economically or socially. The social psychologist Leon Festinger (1919–1989) emphasized this distinction by distinguishing between “internalization” (both belief conformity and behavioral conformity) and “compliance” (behavioral conformity but not belief conformity). Compliance is more likely to occur if a person is restricted from leaving a group or society and when there is a threat of punishment for non-compliance. The likelihood for internalization increases if the person is attracted to the group and wishes to remain a member.

During the 1950s, psychologist Solomon Asch conducted a series of social-psychological experiments that strongly influenced the scholarly discussion of conformity during the following decades. Individuals were asked to match the length of a line with other lines of different length. All but one of the individuals in the group was instructed to make a match that was obviously wrong. When the last, uninformed individual in each group was asked to make a match, one third of the participants yielded to the obviously erroneous judgment of the majority. Among the conforming subjects, a majority later said they conformed because they lacked confidence in their own judgement and concluded they must have been mistaken and the majority was correct. The second most common reason for the individuals were to believe that the majority was wrong, but to suppress this knowledge because of an unwillingness to deviate from the group. Asch showed that a majority of three persons was sufficient to have this effect.

Research in the 1990s by psychologist David A. Wilder has shown that people tend to conform more when the majority consists of ingroup-members, that is, people belonging to the same social category, while they conform less when it consists of outgroup-members, that is, people belonging to other social categories. As argued by psychologist John C. Turner, this fact indicates that group identity is a salient factor for understanding conformity. However, it is of crucial importance that the majority is unanimous; otherwise, conformity decreases dramatically. In a classic 1975 study by psychologist Vernon L. Allen, conformity decreased from about thirty-three to five percent when a single individual deviated
from the group by giving the correct answer. Moreover, as demonstrated by psychologists Rod Bond and Peter B. Smith in 1996 in a meta-analysis of 133 studies from seventeen different countries, people conform more in collectivistic cultures than in individualistic ones.

Conformity is also more likely in cohesive groups and tends to decrease as groups or societies become more complex in terms of role differentiation. This fact indicates that conformity should decrease as societies become more modernized and individualized, a prediction that is supported by Bond and Smith’s analysis.

WHY CONFORMITY OCCURS

Attempts to explain conformity can be grouped into explanations that focus on “normative influence” and those that focus on “informational influence.” In normative influence, people conform in order to avoid negative sanctions or social ridicule. Such explanations have been common in sociology and in 1955 were put forward by Morton Deutsch and Harold Gerard in the field of social psychology. Informational influence is principally associated with Leon Festinger and proposes that processes of social comparison or social reality testing lead to increased belief conformity. In situations of subjective uncertainty in which people lack objective reference points for beliefs, people tend to compare their beliefs to those of significant others. The more their beliefs harmonize with those of significant others, the more valid they judge their beliefs. When people discover that their beliefs harmonize with the beliefs held by most others in the group, people tend to become confident in their rightness and seldom change their opinion. Situations in which people’s beliefs harmonize poorly with those held by significant others, on the other hand, tend to aggravate the feeling of subjective uncertainty. To remedy this situation, people may either try to change the beliefs held by others in the group or change their own beliefs to better reflect those of the group, which is often far easier.

As sociologist Peter Hedström, among others, have argued, it is often a rational strategy to imitate others’ behavior in situations of uncertainty, such as when one glances at other diners for information about which fork to use for the first course, or when the choice of restaurant is based on the number of other people already dining there. However, one risk associated with this strategy is that everyone may imitate the others, and that everyone may think that they alone are uncertain and confused or feel doubt about the rightness of the majority behavior. This phenomenon has been discussed in terms of “pluralistic ignorance.” Pluralistic ignorance, especially when people experience strong normative and informational influence, may lead people to conform to a majority that actually does not exist. In other words, as in Hans Christian Andersen’s story The Emperor’s New Clothes, the conformers may all come to believe that everyone else has understood something important of which they themselves are ignorant, and refrain from questioning the consensus because of fear of ridicule or ostracism. Pluralistic ignorance and conformity in general may thus undermine the potential for creativity and productiveness in a group or society.

Research by psychologist Irving Janis (1918–1990) on “groupthink” showed that compliance within cohesive groups may have disastrous consequences for decision making in crucial situations. The pressure on people to conform to the ingroup increases in polarized situations in which the cost of remaining a deviant or a passive bystander increases. As a result, moderates may suppress their true preferences, which give radical or fanatical elements disproportionate influence.

Conformity thus has a distinctly negative potential. This was demonstrated by research following the 1963 classic experiment by social psychologist Stanley Milgram (1933–1984). Milgram’s experiment showed that many people would blindly follow authorities in situations of uncertainty. By combining these insights, many scholars have argued that conformity is an important prerequisite for military atrocities and fascist practices. As argued by psychologist Rupert Brown for instance, “the well-documented instances of group-instigated atrocities against civilians in Vietnam, former Yugoslavia and other war zones before and since suggest that social pressures to conform [can be] both prevalent in their frequency and tragic in their consequences” (Brown 2006, p. 131).

Congress, U.S.

The principal features of the U.S. Congress affecting its operation and outputs are the elements of its institutional structure, including its size, the manner in which its members are elected, its leadership offices, and the role of political parties. The outputs of Congress are significant because one of the main functions of Congress is to translate citizens’ preferences and needs into government policies. Because Congress does not make decisions in isolation, its interactions with other branches of government also affect its functions.

INSTITUTIONAL STRUCTURE

Article 1, section 1 of the United States Constitution invests all legislative powers in a bicameral (two-house) Congress consisting of a House of Representatives and a Senate. The Constitution further provides that each state will have at least one member in the House of Representatives and two senators.

The House of Representatives contains 435 seats in accordance with federal legislation. Its size has not changed since the 1910 census reapportionment, the process by which the remaining 385 House seats are divided on the basis of state population after each state is allotted its constitutionally guaranteed representative. According to the Constitution, candidates for the House must be at least twenty-five years old, have been a citizen of the United States for seven years, and be a resident of the state (but not district) in which they seek election. House members are elected every two years in single-member (one member per district), plurality (first past the post) legislative districts in elections that must take place on the Tuesday after the first Monday in November in even-numbered years. As a result, every four years members of the House are elected on the day of a presidential election. House districts must be geographically compact and contiguous, have roughly equal population, and be racially fair.

The United States Senate is composed of 100 seats, with two senators elected from each of the fifty states regardless of state size or population. From 1789 to 1913 senators were elected by state legislatures. Senators currently are elected directly by citizens within states in accordance with the 17th Amendment of the U.S. Constitution. A senator must be at least thirty years old, have been a citizen of the United States for at least nine years, and be a resident of the state in which he or she is elected.

Congress uses a system of committees to organize itself. In the first Congresses, the body relied on ad hoc rather than standing committees, in which membership and policy jurisdiction are stable. In the early 1800s the failures of the ad hoc, or select, committee system resulted in a gradual expansion of the standing committee system, although its emergence was slower in the Senate than in the House. Major reductions of the number of committees in both chambers took place in the 1920s and 1940s. The majority party has usually held more seats than the minority on each standing committee. For more than a century, the parties have relied on a seniority rule to determine the chairs of committees.

In the early Congress, formal leadership of each chamber was minimal. There was frequent turnover of the House Speakership and only weak leadership in the Senate. During this period, first the floor and then the increasingly common standing committees often challenged party leaders for control. After the Civil War, polarization of the parties facilitated greater influence by their leaders. However, a lack of cohesion within the Democratic Party in particular, due to the distinctiveness of southern Democrats from the early 1900s to the 1960s, meant that committees, rather than party leaders, were used to organize authority in Congress. In the post-reform
Congress (1974 to the present), the parties have become more internally homogenous and differentiated, leading to greater assertiveness among party leaders such as Newt Gingrich, Speaker of the House from 1995 to 1999. The components of the parties’ leadership structures include (if in the majority) the Speakership in the House and the president of the Senate, and for both parties the majority/minority leader and whip. Each party also maintains a caucus/conference committee, a policy committee, a committee to allocate committee seats, and a campaign committee charged to maximize the party’s seats.

REPRESENTATION
A member of Congress’s (MC) career is influenced by different goals, including crafting effective legislation and turning personal political preferences into public policy, maximizing his or her influence within the legislature, career ambition, and securing reelection. A week spent meeting with concerned lobbyists and raising campaign funds in Washington is usually followed by a weekend back home with one’s constituents, listening to their specific needs and ensuring that the MC is not viewed as “out of touch.”

The nature of congressional elections differs by chamber. House elections tend not to be competitive, with roughly 95 percent or more of incumbents who choose to stand for reelection retaining their office. In contrast, the Senate is more competitive, and Senate seats are much less likely to go unopposed. The cost of a congressional election is enormous and growing, with a majority of campaign expenditures used to purchase advertisements on television. Accordingly, MCs spend much of their time raising money for their next campaign from both political action committees and individual constituents, and potential challengers must prove they can raise the campaign funds necessary to be considered viable candidates. Much of federal campaign finance law is laid out in the Federal Election Campaign Act (FECA) of 1971. A Supreme Court decision, 

Buckley v. Valeo (1976),

upheld FECA’s contribution limits and reporting requirements but struck down restrictions on expenditures by candidates and independent political groups.

To be reelected, MCs must closely monitor their constituents’ attitudes. They must also attempt to appeal both to their primary constituency, or the subset of constituents who will participate in their party’s primary, and their geographic constituency, or the citizens eligible to vote in the general election. Representation of constituents’ interests includes casework, bill sponsorship, committee selection and effort, making speeches on the floor, and roll-call voting. Empirical work has shown that MCs’ roll-call votes tend to match closely the preferences of their district, and those MCs who deviate too far from their constituents receive fewer votes and are less likely to be reelected. In addition, MCs who represent competitive districts and homogenous districts tend to be more responsive to constituents. Senators are more responsive to constituents in the final two years of their six-year terms than in the first four years. Finally, retiring legislators appear to be somewhat less responsive to constituents’ interests.

CONGRESS AND THE PRESIDENT
The relationship between Congress and the president is defined by constituencies and political parties. Each member of Congress must keep the interests of his or her district in mind when taking positions on legislation. The president’s constituency, by contrast, encompasses the entire nation. The political and legislative priorities of the president are thus likely to be different from those of individual members of Congress, even those members within the president’s own party.

Political parties also shape the relationship between the president and the Congress. If the president is affiliated with the majority party in Congress, in particular both of its chambers, the agendas of the president and congressional leadership are more likely to be similar, and opportunities for crafting and passing legislation are greater. If the president is affiliated with the minority party in Congress—a situation known as divided government—these opportunities may be fewer. However, the president may choose to bypass the legislative process in Congress through the use of direct action such as executive orders, which bear the force of law but are not approved by the Congress, or through the threatened or actual use of the presidential veto.

CONGRESS OF RACIAL EQUALITY

The Congress of Racial Equality, or CORE, played a leading role in the civil rights movement of the 1960s. CORE is best known for organizing freedom rides to challenge segregation in interstate busing.

CORE was founded in Chicago in 1942 as “a permanent interracial group committed to the use of nonviolent direct action opposing discrimination” (Meier and Rudwick 1973, p. 8). The key components of CORE’s ideology—interracialism and nonviolent direct action—stemmed from the teachings of Mahatma Gandhi (1869–1948). The charter members of CORE included both blacks and whites, many of whom were students at the University of Chicago. Several of CORE’s founders had been jailed or interned as conscientious objectors to war.

CORE affiliates soon formed in cities across the country. The local affiliates organized sit-downs, or sit-ins as they later became known, to challenge racially segregated public accommodations. They also mounted campaigns to end discrimination in employment, housing, and schools.

In 1947 the national organization organized the Journey of Reconciliation, a two-week bus trip through the upper South to enforce a recent U.S. Supreme Court decision outlawing segregated seating on interstate buses and trains. The participants, who included eight black and eight white men, were arrested and jailed along the way, but most of the charges were later dropped. Although segregation in interstate travel persisted, CORE believed the publicity garnered by the journey made it a success. The Journey of Reconciliation provided the model for the freedom rides of the 1960s.

The student sit-in at a Greensboro, North Carolina, lunch counter in early 1960 gave new life to CORE’s campaign to end segregation in public accommodations. Along with the National Association for the Advancement of Colored People (NAACP) and the Southern Christian Leadership Conference (SCLC), CORE helped to organize the sit-ins that spread throughout the South after Greensboro and resulted in the arrests of thousands of protesters. These organizations joined forces again in 1963 to launch a voter registration drive in the South.

James Farmer (1920–1999), who had been a founding member of CORE, was appointed national director in 1961. Farmer’s leadership propelled the organization to the forefront of the civil rights movement. His first project was the Freedom Ride of 1961. The 1961 ride differed from the Journey of Reconciliation in a few respects—the riders included women, they traveled through the deep South, and they challenged segregated terminal facilities as well as seating. The severe violence encountered by the riders, including beatings and the firebombing of a bus, drew national attention to the cause. Other freedom rides followed.

The efforts of those involved in the civil rights movement came to fruition with the passage of the Civil Rights Act of 1964, banning racial discrimination in public accommodations, and the Voting Rights Act of 1965, enforcing the right to vote.

In the mid-1960s CORE’s focus began to shift from direct action and voter registration to community organization and black identity. At the same time, the group’s membership changed as well, from a balance between white and black members to a predominantly black makeup. At its 1966 national convention, CORE adopted “Black Power” as its slogan and renounced absolute nonviolence, and Floyd McKissick (1922–1991) was selected to succeed Farmer as national director. McKissick resigned in 1968 and was replaced by Roy Innis, who maintained the organization’s emphasis on political and economic empowerment for blacks. At the end of the twentieth century, CORE had approximately 100,000 members.

CONGRESS PARTY, INDIA

The Indian National Congress (INC) has, since the beginning of modern electoral politics in India in the 1920s, been India’s dominant political party. Its leader, Jawaharlal Nehru, became the country’s first prime minister in 1947, the party’s leaders framed the country’s 1950 Constitution, and until 1989, except for a brief interlude from 1977 to 1979, the party always had a solid majority in the Indian parliament. Since 1989 the INC’s position has weakened, with the emergence of a host of regional and caste-based parties that now account for around 40 percent of the seats in the Indian parliament, but the party
has nonetheless retained its position as one of the two national parties capable of forming a coalition in New Delhi. Whether the INC or the Bharatiya Janata Party (BJP) wins power today is in large part a function of who makes the better pre-election deals with these regional parties. In the 2004 elections, the INC played this game much better than the BJP: It won only 145 out of 543 seats outright, but its pre-election deals gave the INC coalition as a whole 219 seats, unexpectedly enabling the INC to form the national government with the additional support of the Communists and a few smaller parties (Wilkinson 2005).

Unlike many of its rivals, the INC has always been a party of national breadth that has tried to incorporate members of all India’s major religious, linguistic, regional, and caste groups. In contrast to the opposition BJP, the INC has supported a secular state in which minority rights are fully safeguarded, though at times—such as in their complicity in the anti-Sikh riots in Delhi after Indira Gandhi’s assassination by her Sikh bodyguards in 1984—some members of the party have conspicuously failed to live up to the party’s declared principles.

The INC was founded in 1885. In its first few decades it represented a relatively loose association of India’s middle and upper middle classes, dedicated to improving Indians’ political rights and employment opportunities within the context of British rule. In the 1920s and 1930s, however, under younger and more radical leadership, it was transformed into a mass party advocating for autonomy and then independence from Britain. Crucial to widening the party’s appeal to the masses was the moral leadership of Mohandas K. Gandhi (1869–1948), who from his first noncooperation satyagraha in 1920 pioneered tactics of massive nonviolent resistance to colonial rule, tactics that would later be influential in civil rights movements in the United States and elsewhere. In the early 1920s, under Gandhi’s influence, the INC forged a wide and deep party organization throughout the country. From 1923, when the INC first decided to compete in the new provincial legislatures set up by the British in 1919, until the late 1930s, the INC used this organization as well as mass campaigns of civil disobedience to establish itself as the country’s dominant political party.

At its height, from the 1930s until the late 1960s, the INC was a strong, internally democratic party that used regular local, district, and national party elections to decide which leaders would receive “party tickets” for seats in the state and national assemblies. This Congress system—a term coined by Rajni Kothari (1963)—provided existing party leaders with an incentive to reach out to newly mobilized groups of voters from middle and lower castes in order to win party elections, and also gave leaders who won these party, state, and national elections broad political support and legitimacy. This internal party democracy has been seen as a major factor in India’s democratic success compared to Pakistan, where the Muslim League was highly centralized, and had no equivalent of the INC’s local party organization, giving it a narrow leadership base that relied on state decrees (Weiner 1990). Unlike the Muslim League, which largely collapsed in Pakistan after the death of its two main leaders (Jinnah in 1948 and Liaquat Ali Khan in 1950), the INC had a solid cadre of democratically elected senior leaders that allowed it to overcome the untimely deaths of Mohandas K. Gandhi in 1948 and Home Minister Sardar Vallabhai Patel in 1950.

The INC’s open membership was not always an unmixed blessing, however. The party’s membership shot up from half a million to four and a half million in the two short years after the party’s unexpected victory in five major provinces in the 1936 provincial elections, and Nehru complained to Gandhi in 1938 that many of these new members were more interested in the INC’s patronage power than in the ideals of the party (Brown 2003, p. 131). Corruption and the abuse of patronage power at all levels of the party remain an issue for the INC, and have periodically helped increase support for various opposition parties, such as Swatantra in the 1960s and the BJP in the 1980s.

Several years after Nehru’s death in 1964, a power struggle broke out in the party between his daughter, Indira Gandhi (prime minister 1967–1984, except for 1977–1979), and a “Syndicate” of INC party barons in the states. This struggle split the party in 1969, after which Mrs. Gandhi used her position as prime minister and her control of state resources to outflank her political opponents within and outside the party—for instance, through development programs that channeled money to her own supporters in the states and away from her opponents, and election finance reforms that effectively denied funding to the opposition Swatantra. In the 1971 national elections, Mrs. Gandhi campaigned as the victorious war leader who had just defeated Pakistan, and also on a platform of abolishing poverty. Her faction of the INC won more than two-thirds of the seats and over the next three years used its majority to push through large-scale nationalization of the financial sector, as well as large-scale nationally funded antipoverty and development programs. Both these programs served a dual purpose: fulfilling the party’s ideological goals and providing large-scale patronage resources for INC leaders.

Under Mrs. Gandhi, however, the INC became more and more centralized—the visible symbol of which was the thousands of INC party hopefuls who traveled to New Delhi before national or state assembly elections to secure her family’s nomination. In 1975 Mrs. Gandhi declared a
national emergency to end growing opposition to her centralizing rule. Much of this opposition, ironically, was from INC members using the same nonviolent tactics they had used in earlier decades against the British. The emergency was deeply damaging to the party’s reputation among lower castes and minorities, many of whom suffered disproportionately from slum clearances and sterilization projects directed by Mrs. Gandhi’s son Sanjay. The emergency ended in 1977, when Mrs. Gandhi called national elections and then lost power to a hastily put together Janata coalition, which governed for two years before the INC won power back in 1980. The INC’s crushing 1977 loss did not, however, lead to a fundamental reorganization and democratization of the party. No internal INC party elections have been held since the late 1960s, and the party has since the 1970s been run largely by members of the Nehru-Gandhi family and their allies: by Indira Gandhi (until her assassination in 1984), by her son Rajiv Gandhi (until his assassination in 1991), and then by Rajiv’s Italian-born widow Sonia and her children Rahul and Priyanka.

Since the late 1980s the INC has been committed to reform of the “Permit Raj” regulation of much of industry and the economy instituted by the party under Nehru and Mrs. Gandhi. A balance of payments crisis in 1991 forced Prime Minister P. V. Narasimha Rao’s INC coalition government to accelerate reforms, which have been largely continued and extended by subsequent BJP and INC governments. But because fundamental reforms would require large cuts in subsidies and a substantial scaling back of political patronage, both of which would threaten the INC’s own “vote banks,” the movement to reform is stop-start. In its attempts at reform, the INC government of Manmohan Singh (Raos re-forming finance minister in the early 1990s) has had to strike a balance between support from industrialists and opposition from many of its own voters and its coalition partners on the Left.

CONJUNCTURES, TRANSITIONAL

In Marxian theory, the term transitional conjunctures refers to a bounded geographical space over a discrete temporal interval within which a revolutionary transformation in class processes occurs. There is general agreement about five class processes based on the particular arrangement by which workers are organized to perform surplus labor: slave, feudal, capitalist, ancient (petty commodity production or self-employment), and communist. A capitalist society is one in which the capitalist class process prevails. A transitional conjuncture occurs when there is a switch of prevalence from one class process to another within a social formation. The holy grail of Marxian economic history has been the dynamics by which transitional conjunctures occurred in the period roughly from the fifteenth to the seventeenth centuries within the geographic space known as western Europe, resulting in a switch from the prevalence of feudal class processes to the prevalence of capitalist class processes.

One of the most influential hypotheses was that the transition from feudalism to capitalism was triggered by the rise of commodity production. Some Marxian theorists, such as Paul Sweezy (1976), assumed that monetized trade led inevitably to the dissolution of feudal relations of production and the rise of capitalist labor power markets. Maurice Dobb (1964) countered this argument by pointing out that serfs producing goods for a monetized market could still be bound in a feudal relationship. The lords could simply extract surplus value in money form, rather than in kind or in direct labor services. Dobb argued that the dissolution of feudal relations was, instead, the result of an economic and demographic crisis triggered by feudal appropriators extracting too large a surplus from the direct producers. The lords took so much surplus value that the serfs were unable to meet the subsistence needs of their families. These conditions resulted in a decline in population and a critical shortage of labor. According to Dobb, it was these conditions that triggered transitional conjunctures in most, if not all, European social formations.

Historian Perry Anderson argued that money exchange and commodity production did not signal a transition to capitalism, but were often precursors to more
centralized versions of feudalism, under absolutist states. Another historian, Robert Brenner, analyzed the classic transitional conjuncture in England and argued that the lords implemented this transition as a profit-maximizing choice, not out of crisis. Based on historical evidence, Brenner reached an essentially postmodernist conclusion that transitional conjunctures varied among the societies of western Europe. Immanuel Wallerstein (1979), on the other hand, rejected the notion of multiple transitional conjunctures in favor of a singular world transition wherein hegemonic capitalism rose to incorporate all modes of production. Stephen Resnick and Richard Wolff (1979), returning to a Marxian class analytical framework grounded in the microeconomics of surplus labor performance and appropriation, argued that transitional conjunctures were not the result of a narrow subset of social factors, whether economic or political, but were, instead, the consequence of the entire matrix of social and environmental factors present in a social formation prior to the transition. For Resnick and Wolff, transitional conjunctures were the overdetermined result of the displacement of multiple conditions for the prevalence of one class process by multiple conditions in favor of the prevalence of an alternative class process.

CONSCIOUSNESS

Consciousness is a multifaceted phenomenon, and many terms are used to describe its facets. Consciousness, conscious, aware of, experience (noun), and experience (verb)—all these words have different meanings in different contexts and for different people, so generalizations about their meaning will necessarily have limited validity. Considerable discrepancies also exist between the conceptual tools available in different languages for classifying consciousness and related phenomena. So, for example, the French conscience encompasses both “consciousness” and “conscience,” as the latter words are used in English; in German the subtle difference between the meanings of the English words “consciousness” and “awareness” is lost when both these words have to be translated as Bewusstsein.

BASIC DEFINITIONS AND PHILOSOPHICAL ISSUES

Because of these linguistic and conceptual problems, every systematic treatment of consciousness has to start with a set of distinctions and definitions for the purpose at hand. The task of formulating these in a way that makes them useful for people with different mother tongues is far from simple. However, aspects of consciousness and related phenomena can be classified in three basic categories: cognitive consciousness, phenomenal consciousness, and control consciousness. All are the subject of ongoing philosophical debates.

Cognitive Consciousness Also referred to as intentionality, consciousness-of, awareness-of, and transitive consciousness, cognitive consciousness entails a mental relation to an object (not necessarily an existing one), and encompasses phenomena such as thinking of a dragon, becoming aware of the presence of another person, attending to a problem and knowing facts about a certain field. In English, awareness is often a more natural choice than consciousness when the cognitive aspect of consciousness is intended. However, the term “consciousness” is not seldom used in an exclusively cognitive sense—for example,
the sociological and political terms class consciousness, gender consciousness, and environmental consciousness. Here consciousness stands for habitual attention to, and knowledge about, the issues in question.

The common denominator of all cognitive consciousness is its directedness toward an object, which may be concrete or abstract. It is an important conceptual fact that a person can properly be said to be cognitively conscious although she is in another sense (phenomenal consciousness, as discussed below) not conscious at all. For example, an environmentally conscious person is still environmentally conscious when sleeping dreamlessly. Similarly, since a person in dreamless sleep knows her mathematics, she is cognitively aware of mathematical facts while sleeping. On the other hand, there are forms of cognitive consciousness that cannot plausibly be ascribed to a dreamlessly sleeping subject, for example, thinking of or presently attending to the facts that she knows.

In this context it should also be mentioned that self-consciousness, which is not seldom given a fundamental role in conceptual schemes for handling matters of consciousness, can plausibly be argued to be a species of cognitive awareness (namely, of oneself). The same holds for reflexive consciousness.

Phenomenal Consciousness A good alternative term is experiential consciousness; sentient consciousness is often given a similar sense but can also have other connotations. A dreamless sleeper does not have any present experiences (or we may suppose so for the sake of this discussion), and is therefore not conscious in the phenomenal sense. An awake person, on the contrary, usually has sensory and perceptual experiences, feels emotions, and entertains mental imagery; all these belong to her phenomenal consciousness.

Two long-standing controversies in philosophy of mind primarily concern phenomenal consciousness: the mind-body problem and the problem of other minds. What is the relation between the brain and phenomenal consciousness? The philosopher David Chalmers (1996) has called this "the hard problem of consciousness." The problem of other minds is, can we ever know what another person’s, or another animal’s, experiences are like?

The relations between cognitive awareness and phenomenal consciousness have been the topic of many philosophical debates. One classic debate concerns whether cognition is necessarily rooted in phenomenal consciousness, or whether one could give an explanation of it in purely nonphenomenal (for example, physical) terms. Philosophers in the so-called phenomenological school argue for the first position, whereas most present-day analytical philosophers and cognitive scientists, not only those of a strictly materialist bent, defend the second.

Today this discussion is usually presented as an issue about the nature of mental representations. Another important controversy concerns whether phenomenal consciousness depends on cognition: Is a pain or a thought phenomenally conscious only by virtue of one’s being conscious of it, or is phenomenal consciousness rather an intrinsic quality of experiences that can be possessed independently of any reflexive consciousness?

Control Consciousness The meaning of this term, for which there are no common synonyms, partly overlaps with that of what Ned Block (1994) calls access consciousness. In our commonsense understanding of ourselves and other people, as well as in many psychological, psychiatric, and neuroscientific theories, consciousness is given a role for initiating and/or controlling behavior. We talk about doing things with or without conscious intention. Psychologists and neurophysiologists speak about automatic versus consciously controlled behavior. A good example of the latter distinction is given by our ordinary, unconscious control of bodily posture versus conscious attempts not to fall when the automatic control fails for some internal or external reason. In some psychiatric theories, consciousness is even given the role of the supreme controlling instance of mental life, and all mental disturbances are seen as results of more or less deep-seated disturbances of consciousness.

A philosophically controversial issue here is: How can consciousness have a causal role to play in behavior, if all our behavior stems from processes in the brain (as neuroscience seems to say)? This problem is sometimes taken as a motive for a materialistically reductive analysis of control consciousness. Control consciousness is then explained in terms of physical or biological regulatory processes. However, such an approach also has to explain the fact that many paradigm cases of conscious control (e.g., consciously regaining posture) also have a phenomenal aspect.

HISTORICAL CONCEPTIONS OF CONSCIOUSNESS

The French philosopher and mathematician René Descartes (1596–1650) formulated a philosophical conception of consciousness in which the concept was differentiated from conscience, with which it was previously conflated. Descartes’s dualism is well known, and already in the seventeenth century it posed an embarrassing philosophical issue, the body-mind problem. He regarded body and mind as two separate but interacting substances, body (or matter) being essentially characterized by spatial extension whereas mind is characterized by thinking. For Descartes the presence of conscious states was a mark of
human beings, in contrast with animals, which he thought were mechanical automata. Although a clear emphasis on cognitive consciousness can be discerned in Descartes’s writings, the cognitive, phenomenal, and control dimensions of consciousness cannot really be disentangled in them. In seventeenth- and eighteenth-century British empiricist philosophy, phenomenally conscious processes and our consciousness of them are the main concerns. However, the problems of cognitive consciousness are still of central concern. For the British empiricists, ideas are experiential states that are accessible by means of introspection, but they are also themselves essentially about things.

John Locke (1632–1704) formulated the distinction between an outer sense—our experiential access to material objects—and an inner sense, reflecting on one’s own experiences. His theory of inner sense can be regarded as the first systematic treatise of introspection. By consciousness Locke meant all ideas that passed in a man’s own mind and his self-consciousness about them. Consciousness, not bodily continuity, was regarded as constitutive of personal identity.

The famous principle of association of ideas can be traced to Aristotle, but it was the British empiricists who made it the foundation of a whole new science. Locke’s formulation of the principle became of utmost importance for the development of psychological ideas in later centuries. Our understanding of the world and of ourselves was seen as built up from associations between ideas that are similar or contrasting, or that just happen to be contiguous in our experience. Later schools of associationist philosophy and psychology (as exhibited in the work of David Hartley, David Hume, James Mill, John Stuart Mill, and Alexander Bain) took it for granted that conscious experience is built up from elements and processes that are discernible to the self-conscious mind. Simple ideas are copies of sensations, and complex ideas are constructed from simple ideas according to the laws of association. Mental elements and the principles according to which conscious thoughts—or ideas—are built up and interact can be investigated by introspection.

In the late eighteenth century the German philosopher Immanuel Kant (1724–1804) questioned the program of the British associationist philosopher-psychologists. According to Kant, a science in the strict sense requires both mathematical measurement and experimental procedures. None of this is possible in the case of consciousness, as thoughts do not exist in a spatial continuum and as man cannot divide himself into one observing subject and one observed object.

**THE BIRTH OF EXPERIMENTAL PSYCHOLOGY**

Trying to overcome the obstacles put up by Kant, German philosophers in the nineteenth century formulated several programs for a science of psychology defined as the study of conscious processes. Based on the psychophysical methods the physicist Gustav Theodor Fechner (1801–1887) had devised in 1860, the German physiologist and philosopher Wilhelm Wundt (1832–1920) institutionalized the new science in Leipzig in 1879 as an experimental laboratory discipline. Wundt and his students defined psychology as the study of immediate experience. They held that it was a proper scientific discipline and that mental processes can be measured provided that one uses controlled experimental methods. Simple introspection was therefore replaced by experimental self-observation, a method that required a painstaking training before the subject could correctly describe the phenomena in his consciousness.

In his *Principles of Psychology* (1890), the American physician and philosopher William James (1842–1910) described psychology as “the science of mental life.” He tried to give a holistic description of consciousness, stressing consciousness as personal, intentional, selective, shifting, and continuous. James’s discussion of consciousness as “a stream of thought” is very similar to the understanding of consciousness in the theories of Franz Brentano, Carl Stumpf, and Edmund von Husserl. During the late nineteenth and early twentieth centuries, the latter philosophers developed what Husserl (1859–1938) in his 1900–1901 work named *phenomenology*. Phenomenology is a philosophy that emphasizes the intentionality of consciousness and the importance of investigating the detailed intentional structure of consciousness. This should be done by means of a certain method, which, although systematically related to introspection, is not identical to it.

In opposition to the British associationists, the phenomenologists stressed the fact that conscious ideas need not be similar to that which they are ideas of. In other words, it is not essential to ideas that they are *images* of their objects. At the beginning of the twentieth century, the psychologists of the so-called Würzburg school (Narziss Ach, Karl Bühler, Oswald Külpe, and others) took an interest in deeper descriptions of phenomena of consciousness. They found in the experimental subjects’ introspective reports instances of “imageless” conscious phenomena (*Bewussteinlagen*) that in their opinion questioned the traditional associationist psychology.
BIOLGICAL, FUNCTIONALISTIC, AND BEHAVRIORIST PERSPECTIVES

During the late nineteenth century there was widespread interest in the possibility of unconscious mental phenomena. Sigmund Freud (1856–1939) famously formulated a systematic theory, or rather several theories, about the unconscious mind. Such an enterprise requires a theory of consciousness. In a crucial paper written in 1915, Freud distinguishes between a “systematic” and a “descriptive” sense of “consciousness.” The systematic sense is close to what is here called control consciousness. The descriptive sense has essentially to do with knowability, but Freud also speculates that a descriptively conscious mental state is conscious by virtue of its possessing a certain intrinsic quality. In Freud’s later thinking, control consciousness is instead described in terms of the mental systems named ego and super-ego.

Within the American school of functionalism that William James was part of, the aim of studying consciousness was regarded with suspicion. In 1904 James even stated that consciousness did not exist, but he meant that it did not exist as an entity, only as a function. With the behaviorists of the early twentieth century, however, the interest radically shifted from consciousness (now often regarded as a metaphysical concept) to behavior. Humans should be understood through their actions and not their thoughts. The idea of finding the basic laws of mental elements using introspective methods was abandoned. The alternative, nonassociationist approaches, such as phenomenology and Gestalt psychology, were also relegated to a minor role in the psychological community. The behaviorists took diverse philosophical positions: Some took the strong metaphysical position that consciousness does not exist, whereas others only defended a moderate methodological statement to the effect that introspective methods should be abandoned as unscientific in favor of behavioral observation.

Behaviorism was to dominate the behavioral and social sciences from about 1920 to 1960. During this time the Gestalt psychologists, who thought in ways related to both phenomenology and the Würzburg school, kept up a keen interest in the study of perception and other forms of experience and did much valuable research on the structure of consciousness. In many respects the thrust of their work was biological, and they were much opposed to explanations of experience by means of mental laws. In Gestalt theory, immediate experience is a direct result of brain processes and cannot be explained by any association of mental elements.

Consciousness research continued throughout the behaviorist era in the fields of psychiatry and neurology. Karl Jaspers (1883–1969), a psychiatrist and philosopher in the phenomenological tradition, in 1913 created a classification scheme for pathological disturbances of consciousness that is still in use. During the whole of the twentieth century, the understanding of consciousness and its pathology was generally regarded as essential for the psychiatric understanding of patients. Around mid-century, the French psychiatrist Henri Ey (1900–1977)—who was also influenced by phenomenological thinking—formulated a new theory about consciousness, stressing its functional and controlling aspects. In most present-day psychiatric theories, however, consciousness is not given such a central explanatory role.

The Cognitive Revolution In the 1960s an important methodological and theoretical shift in the behavioral and social sciences occurred that is often referred to as the cognitive revolution. It was partly inspired by the possibilities offered by computer modeling of rational processes, and it is no coincidence that the main focus of cognitive psychology is memory and thinking. Consciousness was no longer a forbidden territory. Since the 1960s, cognitive psychologists have also shown a renewed interest in unconscious mental processes such as implicit memory, subliminal perception, and other forms of perception without phenomenal perceptual consciousness (e.g., blindsight).

Although consciousness and several different kinds of introspective procedures have once again been admitted into psychology, the terms introspection and consciousness are not used as frequently by psychologists as they were in the early twentieth century. This may not be of any importance in itself, but it reflects the more serious circumstance that there is a fundamental break of tradition between the old psychology and the new. This break also means that several philosophical and methodological issues, which were common knowledge in the psychological community in the early 1900s, seem to be little known by many behavioral and social scientists of the twenty-first century.

However, there are signs that this situation is changing. Since the 1990s a large amount of interdisciplinary work on consciousness has been accomplished, partly under the auspices of independent organizations such as ASSC (Association for the Scientific Study of Consciousness), but also within the academic programs of many universities around the world. Neuroscientists and philosophers, as well as behavioral and social scientists, participate in this effort. The body-mind problem occupies one focus under the name of a search for “the neural correlate of consciousness.” The role of consciousness in perceptual and motor processes is another much researched and hotly debated topic. Finally, “mentalizing” (ascribing mental states to other people) is a third area of
Conscription, Military

central concern for today’s interdisciplinary study of consciousness.

CONSENSUS

Consensus refers both to a state of common feeling or agreement in a group and to a decision rule by which a group or society determines legitimate political authority and coordinates political action. The term derives from the Latin consent, which is closely related to consent, and was first used in modern times to describe the relationship between different parts of a system in working toward the purpose of the whole. Characteristic of many nineteenth-century writers, Émile Durkheim posits the analogy of a “spontaneous consensus of parts” in the body social as a necessary condition for the preservation of order in increasingly differentiated societies (1984, p. 297). Contemporary theories of communitarianism, civic culture, and liberal pluralism follow Durkheim, to different degrees, in staking democratic order on a value consensus embedded in social norms, practices, and institutions.

Theorists of participatory and deliberative democracy often abandon the search for an empirical consensus underlying social order and instead hold consensus as a normative ideal of political decision making amid human conditions of difference and conflict. For Jean-Jacques Rousseau, legitimate political authority rests not on the consent of the majority—the domination of a part of society over the whole—but on a consensus that accounts for the interests of all members of society. Consensus thus seeks to preserve individual freedom and political equality. Indebted to Immanuel Kant’s (1724–1804) theory of common sense, Jürgen Habermas (1990) locates the ideal of consensus in the fundamental practice of communication, which presupposes the possibility of shared understanding between speakers. The expectation of rational consensus inherent in speech establishes certain norms for political deliberation, most notably reason, inclusion, participation, and publicity. On many accounts, consensual politics requires both constitutionally protected public spaces and institutionalized procedures that incorporate the previous norms into decision-making processes.

Critics of consensualism worry that the ideal of consensus carries normalizing and repressive effects on groups and societies. Theorists of agonistic democracy, such as Iris Marion Young (2000) and William E. Connolly (1991), contend that commitment to a strong rational consensus privileges certain modes of expression and participation to the exclusion of others and often brackets difficult issues from public discussion altogether. Thus, consensual ideals of political engagement and outcome effectively silence some points of view. While agonistic democracy affirms the possibility of agreement on particular issues in particular circumstances, it recognizes the contingencies and exclusions that constitute any strong value consensus and emphasizes a care for difference and struggle as central elements of politics.

In practice, consensual politics have long embodied the ideals and tensions of these competing theoretical strains. While consensus was the aim, if not always the abiding practice, in the political assemblies of ancient Athens, classical writers from Thucydides (c. 460–c. 400 BCE) to Aristotle cautioned against the dangers of popular rhetoric in fomenting collective tyranny. The Iroquois
Confederacy explicitly protected dissenting views during consensual processes by establishing mechanisms for veto power and for the revisiting of contentious issues. The Religious Society of Friends and the peace and environmental movements of the late twentieth century are examples of groups that use consensus decision-making practices.

CONSERVATISM

The term conservative is derived from the word conserve, and in a political sense is often used to indicate a desire to preserve existing political and social arrangements, institutions, policies, or customs. This conception of conservative leaves as a critical defining question what it is that one is seeking to conserve.

Both European and American conservatism contain numerous strands, but share some points of commonality. To a significant extent, both developed as a response to revolutions from the Left, the violent revolution of the guillotine in France in the 1790s and the peaceful revolutions of New Deal economics and counterculture social mores in the United States in the 1930s and 1960s. Both European and American conservatism have been imbued with a strong sense of anti-utopianism and a greater deference for religion, tradition, experience, and property than that found on the Left. On many other scores, however, the two versions of conservatism—or some of their constituent strands—are quite distinct. Those strands are defined by the question of whether they are a subset of liberal democratic politics or a reaction against it.

EUROPEAN CONSERVATISM

Representing one pole of European conservatism was Edmund Burke (1729–1797), the English parliamentarian who wrote Reflections on the Revolution in France in 1790. Reflections embodied not so much an ideology as an anti-ideology, a marked preference for experience, tradition, decentralization, and prudence over the abstract theorizing that drove the French Revolution and that, Burke predicted, would lead to a new and unconstrained form of despotism. Burke favored evolutionary, rather than revolutionary, change, though he supported the moderate American Revolution. He also favored a trustee model of representation consistent with his fear of mass democracy unchecked by moderating institutions. In essence, Burke advocated the conservation of liberal society though caution and prudence. Directly descended from Burke, nineteenth-century British conservatives like Benjamin Disraeli (1804–1881) called for “Tory democracy,” reforms aimed at giving the lower classes a greater stake in the preservation of traditional English liberty. This conservatism retained, to some extent, an aristocratic and paternalistic cast.

The other pole of European conservatism was starkly reactionary, calling for a restoration of absolute monarchy and Catholic faith summed up in the slogan “throne and altar.” Chief among these clerical monarchists were Count Joseph de Maistre (1753–1821) and Louis de Bonald (1754–1840). Where Burke extolled ordered liberty, Maistre and Bonald were content with order. In his Essay on the Generative Principle of Political Constitutions (1810), Maistre argued against rationalism in politics. He held with Burke that attempting to remake society on the basis of abstract conceptions through such devices as a declaration of rights or a written constitution was foolhardy (and often destructive). Human society was too complex to manipulate in that way. However, to Maistre, absolutism, tempered by religion—the combination of “Pope and executioner”—was the solution for social instability.

In nineteenth-century Germany, the antirationalist and clerical romantic school—heavily influenced by Maistre, but both political and literary in character—developed among thinkers like Adam Muller, K.L. von Haller, Joseph von Radowitz, and Karl von Vogelsang, idealizing the German Middle Ages. At the same time,
Joseph von Gorres, a former supporter of the French Revolution, swung around to embrace Maistre’s theocratic vision. His Gorres circle of thinkers was important in German intellectual life at midcentury, and some argued that it contributed to subsequent German and Austrian authoritarianism.

Also clustered nearer to Maistre’s pole than to Burke’s, a strand of extreme nationalism appeared in the late nineteenth century, though its ultimate form arguably represented a repudiation of traditional conservatism rather than a completion of it. In France, Maurice Barres (1862–1923) and Charles Maurras (1868–1952) advocated nationalism as the sole source of social rootedness and authoritarianism as the means of expressing that nationalism. Maurras, unlike both Barres and traditional conservatives, embraced mass agitation and atheism and ultimately veered into fascism. More directly influencing national socialism, Heinrich von Treitschke (1834–1896), author of German History in the Nineteenth Century (1879–1894), advocated a blunt philosophy of racial nationalism, power, and militarism, themes at odds with the mainstream of European conservatism.

Clustered around Burke’s pole were a variety of thinkers whose aim was not restoration of the Middle Ages but the ennobling and conservation of European liberty in one form or another. Like Burke, the Frenchman Alexis de Tocqueville (famous for writing Democracy in America in the 1830s and Ancient Regime and the Revolution twenty years later) was supportive of popular constitutional government and evolutionary change but cautioned against democracy’s potential for excess. Indeed, it is an interesting conceptual question whether Tocqueville should be considered a liberal conservative or a conservative liberal. To the French revolutionaries, egalitarianism and liberty went hand in hand. To Tocqueville, the two values could easily conflict, as local liberty and individual difference might be sacrificed to a single-minded pursuit of equality. Tocqueville thus called for countervailing features like freedom of the press, independent courts, local government, a strong civil society, and Christian morality to preserve liberty.

Another school focused on economic liberty. From Adam Smith in the eighteenth century to the Austrian school of Ludwig von Mises and Friedrich Hayek in the twentieth, these thinkers shared an appreciation for private property, decentralization of power, and organic evolutionary change. While far removed from Maistre, they were compatible with Burke and Tocqueville. Hayek assaulted central planning in his 1944 book The Road to Serfdom, in which he argued that central planning invited both tyranny and economic inefficiency. Hayek preferred to call himself a liberal, but in the context of the rise of both democratic and totalitarian socialism, must be (and usually was) counted a conservative.

In between the poles, Clemens von Metternich served as foreign minister of the Habsburg Empire from 1815 to 1848 and was a key figure in the Congress of Vienna, the 1815 diplomatic conference in which the kings of Europe agreed on a framework to keep the peace after the Napoleonic wars. That framework relied on the defense of monarchy and the suppression of radicalism. Although Metternich is widely criticized as a reactionary, he was also cosmopolitan and pacific and advised the Hapsburg emperor to grant more constitutional rights to Hungary and other outposts of the empire. He called his philosophy “conservative socialism”: socialism defined as organic social unity in preference to atomistic individualism, a notion that defined much of European conservatism. Metternich’s secretary Friedrich Gentz translated Burke’s Reflections into German, wrote widely himself, and shared Metternich’s cosmopolitanism.

In postwar, increasingly secular, Europe, both extreme nationalism and clericism withered; Maurras fell with Vichy France, and the last European outpost of Maistre was arguably Franco’s Spain. Rather, the conservatism of the last half of the century was dominated by figures influenced most by the Burkean pole’s paternalistic offshoot (the British statesman Winston Churchill [1874–1965], who sought to model himself after Disraeli), by its free-market offshoot (Britain’s Margaret Thatcher or Italy’s Silvio Berlusconi), or by Metternich’s cosmopolitanism (Germany’s Konrad Adenauer and Helmut Kohl and other European Christian Democrats).

In the nineteenth and twentieth centuries, a Latin American conservatism arose that largely paralleled its European counterpart. After independence, Maistre dominated, as conservatives promoted close church-state connections and centralized state authority. The twentieth century saw a divide between Maistre’s conservatism, reflected in extreme form in the Argentinean junta among others, and a free-market, neoliberal conservatism more comfortable with Burke and Smith. (The Chilean military dictatorship incongruously melded Maistre’s politics and Smith’s economics.) In contrast to Europe, however, the Burkeans seemingly gained the upper hand only in the last fifth of the century.

AMERICAN CONSERVATISM

Historian Louis Hartz famously argued in 1955 that there were no true conservatives in America, only rival species of liberals. Nevertheless, American thinkers as disparate as the anti-federalists, Alexander Hamilton, John Adams, and John Calhoun have sometimes been labeled “conservative.” Modern American conservatism, however, grew out of opposition to the New Deal and the rise of the wel-
fare state. Its first mobilization took the form of the American Liberty League in the 1930s, consisting of an alliance between Republican businessmen and Jeffersonian Democrats. This nascent conservatism drew on a belief that the New Deal threatened constitutional principles by centralizing power, undermined the free enterprise system, and corrupted the civic virtue of Americans. If equality was the first value of the New Deal, the chief aim of these conservatives was the preservation of Lockean liberty. Like Hayek, President Herbert Hoover long argued that he was the real liberal, as he—not Franklin Roosevelt—had remained true to the tenets of limited government and free markets that defined classical liberalism. Senator Robert Taft (R-OH), though sometimes dubbed “Mr. Conservative” by contemporaries, fell in this category as well.

A number of other influential figures came to advance free-market economics and limited government. Among these was Nobel economist Milton Friedman, whose Chicago school advocated “monetarism”—an emphasis on free markets and control of the money supply—as an alternative to liberal Keynesianism. Though not as libertarian as the Austrian school of Hayek and von Mises, Friedman favored limits on government spending, taxing, and regulation, as well as school vouchers and a negative income tax as an alternative to welfare. In the 1970s, a school known as supply-side economics was advanced by economic thinkers like Arthur Laffer, Robert L. Bartley, and Jude Wanniski. The supply-siders emphasized improved incentives for work and investment. While differing on many specifics, the revived schools of free-market economics agreed that political liberty and economic liberty were intertwined.

A second strand of conservatism was skeptical of mass politics and abstractions like natural rights, and was concerned with the decline in importance of religion and traditional social forms and morals. The postwar traditionalists were anticipated in some respects by a school known as Southern Agrarianism (Richard Weaver, John Crowe Ransom, and others), whose unhappiness with industrialism and materialism was laid forth in their 1930 manifesto I Take My Stand. Traditionalism’s most noteworthy spokesmen in the 1950s were Willmoore Kendall and Russell Kirk, the latter of whom argued his case for “the permanent things” in The Conservative Mind from Burke to Eliot (1953). Unlike many of the constitutionalists and the libertarian-leaning economists, these thinkers were not averse to the label “conservative.” While these traditionalists may have been the most European strand of American conservatism, none were enamored of authoritarianism. Indeed, their fear was that tyranny would result from the collapse of virtue that they diagnosed. The traditionalists sought refuge for liberty in the Anglo-Saxon tradition of liberty rather than in natural rights, and what they sought to conserve above all was Western civilization.

A third strand of postwar conservatism consisted of a strong anticommunist movement. While Senator Joseph McCarthy (R-WI) is perhaps the best-known, and most notorious, anticommunist conservative of the era, anticommunism was widely shared by millions of Americans who were concerned by the totalitarian character of Leninist ideology, the international threat posed by the Soviet Union, and the penetration of domestic communism into American social and governmental institutions. Key intellectual figures in this movement were the former Trotskyite James Burnham and former communist Whittaker Chambers. Chambers testified against State Department official and Soviet spy Alger Hiss and wrote the widely read book Witness (1952) to chronicle his religious and political conversion. Anticommunism was an essential glue, appealing both to the religious scruples of the traditionalists and the limited government views of the economic conservatives.

While not part of the broad public resurgence of conservatism, other rightward intellectual currents of the time were represented by anti-utopian philosophers such as Leo Strauss (1899–1973) and Eric Voegelin (1901–1985). Strauss looked to classical Greek philosophy for guidance to the good life and best society. Voegelin fashioned a philosophy emphasizing experience and both the transcendence and limits of humans.

The conservative movement as a coherent force was forged in the mid-1950s when the three major strands of conservatism coalesced. A key moment in that effort was the founding by William F. Buckley of the conservative journal National Review in 1955. National Review advanced what became known as fusion, a conception of conservatism that balanced and wove together the three strands.

While the conservative movement was coming together at the intellectual level, it was also gaining at the grassroots level. Arizona Senator Barry Goldwater’s 1964 Republican presidential campaign recruited tens of thousands of conservative volunteers into Republican politics and shifted the party to the right. Goldwater was the first major American political figure in the postwar era to embrace the label “conservative.” In his 1960 book Conscience of a Conservative, Goldwater laid out a “fusionist” doctrine that was economically free-market, politically constitutionalist, vehemently anticommunist, and religiously grounded. It was also populist in the style of the English Whigs, the “country party” that regularly took the “court party” to task for its elitism, corruption, and autocratic tendencies. After Goldwater’s landslide defeat against Lyndon Johnson in 1964, many commentators...
concluded that conservatism as a political force in America was finished.

However, developments in the 1960s and 1970s from stagflation to moral permissiveness to Soviet advances abroad made the conservative critique seem increasingly plausible. At the same time, three new ingredients were added to the stew of American conservatism. One was the growth of black intellectual conservatism represented by thinkers like economists Thomas Sowell and Walter Williams, social commentator Shelby Steele, and future Supreme Court Justice Clarence Thomas. Another was the development of neoconservatism in the form of figures such as Midge Decter, Nathan Glazer, Jeane Kirkpatrick, Irving Kristol, Norman Podhoretz, and Ben Wattenberg. Neoconservatives were typically once-liberal intellectuals who had shifted significantly to the right on the ideological spectrum owing to concerns about Soviet expansionism and cultural issues. While limited in number, the neoconservatives also added considerable intellectual heft to the conservative movement through organs such as Commentary and The Public Interest.

Finally, a new mass movement of social and religious conservatives arose to complement the traditionalist intellectuals. This movement was distressed by what it perceived as the moral breakdown of American society and the role of government policy in abetting that breakdown. Ultimately known as the “religious right” or the “Christian right,” it was catalyzed by the Supreme Court’s abortion, school prayer, and obscenity decisions, the fight over ratification of the Equal Rights Amendment, and rules proposed by the Internal Revenue Service during the Carter administration that threatened the tax-exempt status of many Christian schools. Mass organizations like the Moral Majority and, later, the Christian Coalition formed to promote socially conservative policies.

The growing strength of American conservatism helped lead to the 1980 and 1984 presidential victories of former California governor Ronald Reagan, by then the unquestioned standard-bearer of the conservative movement. Reagan, like Goldwater, promoted a populist blend of free market economics, cultural conservatism, and anti-communist nationalism, though without Goldwater’s harder edges. Although falling short of many of his goals, Reagan achieved a significant rightward move in public policy and forged a strong Republican electoral coalition that contributed to the Republican takeover of Congress in 1994 and to Republican electoral successes in the early twenty-first century.

Nevertheless, when President Bill Clinton successfully stymied many of their policy departures after 1994, many conservatives searched for a new approach. In his 2000 campaign and subsequent presidency, George W. Bush offered what he called “compassionate conservatism,” a reorientation of conservatism that would accommodate big government rather than trying to curtail it, and would institute reforms aimed at making it more accountable and more subject to citizen choice.

CONTRASTS AND TENSIONS

In Europe, a considerable distance separated Burke from Maistre, and a vast gulf divided Burke, Tocqueville, and even Metternich on one hand from the outliers Maurras and von Treitschke on the other. Even within the narrowed range of postwar European conservatism, divisions remained, for example between free-market Thatcherites and their more paternalistic and statist Tory compatriots in Britain. Arguably, not as much distance has divided American conservatives, who largely agreed that what they wanted to conserve was the synthesis between Lockeanism, biblical republicanism, and classical Western civilization that they held to be essential parts of the nation’s heritage. Nevertheless, they have differed about what themes to emphasize, and have often differed over specific means. The more libertarian-leaning of the economic conservatives have an uneasy relationship with the social/cultural conservatives. Those traditionalists who eschew natural rights have clashed with other conservatives who defend the natural rights paradigm. Even the monetarists and the supply-siders have engaged in sometimes bitter disputes. When some post-Reagan conservatives argued for a conservatism grounded not in limited government but in promotion of “national greatness” or of a more accountable form of big government, this innovation brought vehement opposition from others. George W. Bush’s compassionate conservatism was at the center of that debate.

American conservatism has been more populist and dynamic than its European counterpart, and less paternalistic, aristocratic, authoritarian, and clerical. There is no influential American counterpart to the tradition of Maistre, let alone Maurras. However, the gap between the continents has narrowed substantially as postwar European conservatism shifted decisively in favor of its Burkean pole. Reagan’s kinship with Thatcher in the 1980s illuminated an increasing convergence in favor of a conservatism that seeks to preserve the (classical) liberal polity against more radical challenges at home and abroad.

CONSERVATIVE PARTY (BRITAIN)
The British Conservative Party is one of the oldest and most successful democratic political parties in the world. The party originated in the late seventeenth century as the aristocratic “Tory” faction in parliament, with the name “Conservative” achieving currency only in the nineteenth century. In 1894 the party’s official name became the “Conservative and Unionist Party” following a merger of the Conservatives and the Liberal Unionist Party. The merger was a result of a protracted conflict that split the Liberal Party into “home rule” and “unionist” groups, with the latter joining the Conservatives to maintain the union of Great Britain and Ireland. In the twentieth-century, the Liberals were replaced by the socialist Labour Party as the Conservatives’ principal rivals for power following a further Liberal split during the First World War. The Liberals did not disappear, but they remained an ideologically centrist “third” party whose fortunes mostly waned, and occasionally waxed, over time.

There are three major components in Conservative thought. The first—often labeled “Tory” Conservatism—has roots in the ideas of the British philosopher-politician Edmund Burke (1729–1797). Burke argued that societies were organic, but not static, entities. Social change should be gradual and evolutionary, rather than abrupt and revolutionary. A principal task of the Conservative Party and its leaders was to guide change in ways that would preserve the essential elements of Britain’s social fabric. For Burke, the maintenance of hierarchy, continuity, and an interlocking system of mutual social obligations were the ends of good government.

Burke’s ideas were given renewed force in the late nineteenth century by Benjamin Disraeli (1804–1881). Leading his party and country when the Industrial Revolution was creating a new urban working class, Disraeli propounded the idea that Britain was “One Nation.” Rather than arraying itself in a coalition with the middle and upper classes that was indifferent to working class concerns, Disraeli proposed that the Conservatives develop policies that would serve the interests of all classes.

Inspired by Disraeli’s “One Nation” ideas, many subsequent Conservative politicians and political thinkers endorsed the broad panoply of social programs characteristic of the twentieth-century welfare state. Much of this was prompted by the Labour Party’s victory in the general election of 1945 and the popular program of policy changes introduced by their government. By doing this, the Conservative Party was able to recover lost ground and capture power again in 1951. “One Nation” Conservatives also adopted assumptions of Keynesian economics, particularly the idea that substantial state intervention in the economy could control inflation and unemployment, while also promoting growth and innovation. By the late 1950s, Conservative and Labour policies had become rather similar, leading observers to coin the term Butskellism—an amalgam of the names of the leading Conservative politician “Rab” Butler and the Labour leader Hugh Gaitskell—to describe the convergence between the parties’ platforms.

A third, “laissez-faire,” component of Conservative thought rejects the interventionist thrust of the Disraeli-Butler tradition. This reflects the free-market ideas associated with Adam Smith that were originally embraced by the Liberal Party. Beginning in the late 1960s, Sir Keith Joseph and other advocates of free-market economics and smaller government became increasingly influential in the party. This neoliberal movement found a champion for its ideas in Margaret Thatcher, who succeeded Edward Heath as the party leader in 1975. In 1979, a combination of accelerating economic decline coupled with mounting social and political turmoil enabled Thatcher to lead her party to power. Thatcherism subsequently came to describe a mix of policies designed to promote free-market economics and lessen public reliance on what Mrs. Thatcher derisively termed the “nanny state.” In foreign affairs, following Winston Churchill and other earlier Conservative leaders, Thatcher vigorously opposed communism and promoted strong ties with the United States.

Although initially unpopular, Thatcher’s public standing improved markedly in 1982 as a result of
Britain’s victory over Argentina in the Falklands War. After leading her party in two more successful general elections, her tenure as prime minister abruptly ended in November 1990 when she was ousted in an intra-party revolt. Her replacement was John Major, who achieved a very narrow and widely unexpected victory in the 1992 general election. Conservative support was then driven sharply downward by a relentless combination of recession and economic mismanagement, internecine conflict over relations with the European Union, and persistent allegations of “sleaze.”

The party’s vulnerability was enhanced by the resurgence of the Labour Party. Labour had lurched to the ideological left in the late 1970s, effectively making itself unelectable for nearly two decades. However, under the leadership of Neil Kinnock and John Smith, and then Tony Blair, Labour again became a serious contender for power. Chosen party leader in 1994, Blair argued that a Labour government should use the tools of capitalist economics to generate the resources needed to achieve egalitarian policy goals, specifically to fund cherished social programs cut by successive Thatcher-Major governments. In 1997, Blair’s “New Labour” party won a landslide victory, reducing the Conservative vote to 30.7 percent, the lowest figure in over 100 years. In two ensuing general elections, that figure increased only marginally—to 31.7 percent in 2001, and to 32.4 percent in 2005.

In the early twenty-first century, the Conservatives are no longer the dominant force that prompted observers to lionize them as Britain’s “natural governing party.” Searching for new ideas with widespread appeal, subject to continuing intraparty conflict, and suffering much reduced local party membership, Conservatives have struggled to find a formula for renewal. Acting on the correct assumption that one part of a winning formula is leadership, the party has fielded four leaders—William Hague, Iain Duncan Smith, Michael Howard, and David Cameron—since their 1997 debacle. Two of these people (Hague and Howard) promptly led the party to electoral defeat, and one (Duncan Smith) was ousted before he had a chance to do so. However, Cameron may fare better. He is attempting to cast off the legacy of Thatcherism by moving his party back to the ideological center ground and casting himself as both competent and compassionate. His efforts to improve Conservative fortunes are being helped by widespread dissatisfaction among Labour supporters with Tony Blair, and by a series of misfortunes similar to those that beset the Conservatives in the 1990s. Whether this combination of strategy and circumstance will prove a winning one for the Conservative Party remains to be seen.

CONSISTENCY

SEE Properties of Estimators (Asymptotic and Exact).

CONSPICUOUS CONSUMPTION

The American economist Thorstein Veblen first introduced the term conspicuous consumption in his work *The Theory of the Leisure Class* (1899). The theoretical starting point for discussing the term is the evolution of hierarchical structures in societies, which produce more than is required for subsistence. An unproductive leisure class emerges that accumulates wealth and secures status that is not enjoyed by the laboring class. Conspicuous consumption is the vehicle by which members of the leisure class convey their position of wealth and status to other members of society. Veblen maintained it is not enough to be wealthy; to have status individuals must display their position of wealth via consumption.

In its most traditional guise, leisure is the main focus of conspicuous consumption. The old aristocracy spent much of the social calendar hunting, fishing, horse racing, and whatever else was of interest. As societies became more atomized, however, and capitalist enterprise became the main source of wealth, consumer goods became the main vehicle for social signaling.

Economists have used conspicuous consumption as an explanation of growth in consumer spending. For Veblen it was the main driving force behind the consumer
boom that started in the 1890s. In 1982, the historians Neil McKendrick, John Brewer, and J. H. Plumb argued that it provided the birth of the consumer society itself at the time of the Industrial Revolution. This view has been contested by historians and scholars, who point out that most of the growth in consumption during the Industrial Revolution was in items such as domestic coal, for which there was no social cachet.

This separation between goods that confer status and goods that are more basic, or less visible, is usually employed in economics. Often a utility function that individuals maximize (the mathematical equation relating consumption to utility) is decomposed into two parts representing social and private utility. Under this neoclassical approach, an opportunity for welfare-improving taxation is afforded by individuals choosing wasteful conspicuous consumption. This approach has also been used to explain why indicators of happiness are stagnating in developed countries, since individuals are failing to achieve their status objectives.

Sociologists have emphasized the power of social structure on the consumption of all commodities. In his Social Structures of the Economy (2005), the leading theorist of consumption, Pierre Bourdieu, said, “While economics is about how people make choices, sociology is about how they don’t have any choice to make” (p. 1). Instead of consciously choosing to engage in conspicuous consumption according to rational calculation, individuals are driven by cultural forces beyond their control. In the French housing market, for example, the desire to own a house takes on mythical proportions. People force themselves to go into large debt in order to meet a societal ideal.

Bourdieu’s emphasis on the unconscious formation of social identities also offers a more subtle interpretation of conspicuous consumption than its usual crude association with overt displays of status. During the postwar period the rich have become less overt in distinguishing their consumption from the expenditure power of the rising middle classes. Bourdieu’s work offers a framework in which the consumption patterns of the rich appear to be based on their cultural capital, made to appear natural as part of the unequal structure of power.

CONSTITUENCY

A constituency is the portion of a nation, state, or locality represented by a particular elected official or other political leader. The term can refer to a group of people (for instance, the constituency of a U.S. senator from Illinois includes all the people who live in Illinois) or a geographic area (the state itself). Political scientist Richard F. Fenno Jr. (1978) parses the term more finely, to incorporate four types of constituencies. A geographic constituency is defined by boundaries fixed by legislative or court action; it can be based on a district’s size, its location, its industrial or business character, or the socioeconomic status, ethnicity, or other characteristics of its population. A reelection constituency consists of the people in a district whom a representative considers his or her supporters: that is, those likely to vote for the candidate’s reelection. A primary constituency includes a representative’s strongest supporters—his or her “base,” often including activists for groups that ally themselves with the candidate. Finally, the term personal constituency refers to a representative’s closest advisers and confidants, who may influence his or her decision-making. When a representative speaks of constituency, then, it is important for a social scientist to determine how the representative defines that term.

Research shows that a constituency can be represented in many ways (Eulau and Karps 1977). Policy responsiveness occurs when a representative advocates the preferred issues of the majority of his or her constituents. In the case of service responsiveness, the representative works to provide benefits for individual constituents or groups, ranging from tours of Congress to intervention with a government agency on a constituent’s behalf. In the case of allocation responsiveness, the representative serves the constituency by “bringing home the bacon,” including tangible, pork-barrel projects such as new highways. Symbolic responsiveness involves less tangible efforts by the representative to gain constituents’ trust. A related notion is mirror representation, in which the representative shares salient characteristics with the constituency, such as race or gender. The value of mirror representation rests on the presumption that, for instance, an African American legislator can better understand and speak for the needs of African American constituents than a white legislator can (Pitkin 1967). This assumption helped lead to the cre-
ation of majority-minority legislative districts under the Voting Rights Act beginning in the 1980s.

The term constituency can also refer to the supporters of a public figure or the clientele of a business or interest. A prospective Senate candidate might direct his or her appeals to a national constituency of campaign contributors or to a specific group such as gun rights enthusiasts. Even an unelected public official, such as a bureaucrat working for the National Labor Relations Board, may well make decisions with the concerns of organized labor or small business owners in mind. Or a newspaper might change its format in order to expand its appeal to a local constituency of readers.

Democratic nations vary a great deal in constituency size and in the way constituencies are represented. For example, British Members of Parliament (MPs) have, on average, only one-seventh as many constituents as do American members of Congress, and MPs’ constituencies tend to be much smaller geographically. However, constituency representation in the American Congress has traditionally focused more on service and allocation than is the case in Britain, despite the greater size of U.S. congressional constituencies, due to the American constitutional emphasis on separation of powers and federalism, which inhibits the development of stronger national political parties. Thus, members of Congress have greater independence from their parties, and consequently a greater need for a personal tie with constituents than do MPs. In recent years, however, personal ties have become more characteristic of the MP-constituent relationship (Cain, Ferejohn, and Fiorina 1987).

The power of a constituency to elect its representatives is central to the working of a democratic system, in that it offers the potential for popular control over government. The existence of that control in practice may be limited by several factors, however. Constituents have been found to gather relatively little information about public policies and the behavior of their representatives. Furthermore, the vote frequently fails to convey specific sets of instructions from constituents to their elected representatives as to what actions to take—especially in American elections, which are regularly scheduled and therefore do not necessarily occur at a time of special relevance for a particular issue. To communicate specific concerns, constituents can lobby their representatives through letters and e-mails, campaign contributions, protests, interest-group and party activism, media ads, visits to legislators, and testimony given to congressional committees—all costly to constituents in time, effort, and money.

Despite these very real limits on the ability of constituents to control their elected officials, the existence of a constituency with the power to select its representatives is nonetheless one of the most important checks on government power. Constituents also serve as the support for political parties and interest groups, two of the other primary restraints on government.

CONSTITUTION, U.S.

In 1787 delegations from twelve of the thirteen states of the fledgling United States (all but Rhode Island) descended on Philadelphia, Pennsylvania, to consider revising the Articles of Confederation, which had provided a roadmap for national government since their ratification in 1781. Over the course of four sweltering months, these delegations met under a cloak of secrecy to consider how best to keep the United States whole. The proposal that emerged in late September 1787 was not a revision of the Articles of Confederation but an entirely new document which, upon ratification, became the Constitution of the United States of America. That Constitution has survived, more or less intact, for more than 200 years.

In the years between the Revolutionary War and the Constitutional Convention, the United States operated pursuant to the Articles of Confederation. As the name implies, the Articles envisioned a confederation of autonomous states, with a limited national government to provide national defense and otherwise manage foreign affairs. The national government, however, could do little without the consent of at least nine of the thirteen states.

The Articles of Confederation proved unworkable. The national government had difficulty collecting funds from the states to pay the immense debts incurred during
the war, and they could not even compensate the soldiers who had fought on behalf of independence. Moreover, as the states coined their own money, forgave debts of their citizens owed to citizens of other states, and erected trade barriers among themselves, the national economy floundered. Among the country’s leaders, James Madison of Virginia and Alexander Hamilton of New York lobbied the loudest for reform. Shays’ Rebellion, an armed insurrection by a band of impoverished Massachusetts farmers, lent a sense of urgency to their demands and the national Congress decided to convene a delegation of reform in Philadelphia.

The Philadelphia Convention brought together some of the most prominent political voices of the time. Some, such as James Madison, considered the convention an opportunity to create a strong national government. In a tactical coup, Madison and his delegation from Virginia arrived early, marshaled their arguments, and proffered a coherent plan for sweeping reform—the Virginia Plan—a mere four days after the convention was called to order.

Delegates who favored state sovereignty and limited national government proposed alternatives, most notably the New Jersey Plan. The Virginia delegation, however, had successfully framed the debate, and while the convention debate prompted considerable compromise, the proposal that emerged from the convention vastly increased the power of the national government relative to the states.

Specifically, the proposed constitution created a bicameral legislature, with representation based on population in one house and equal for every state in the other; a unitary executive; and a Supreme Court. Perhaps most importantly, the proposed constitution vested control over interstate and foreign commerce with the national government and gave the national government the power to levy taxes rather than rely upon the largesse of the states for funds. Overall, the proposed document gave the national government control over the nation’s economy and foreign affairs; while states retained significant sovereign power, the document explicitly rendered that power inferior to that of the national government.

While the proposed constitution increased the power of the national government, it nevertheless reflected a deep skepticism of any unchecked power. The institutions of national government are each constrained by the others, forcing deliberation, compromise, and incremental policy making. Similarly, while the Congress and the president are ultimately accountable to electoral pressures, the Supreme Court is insulated from such forces by life tenure. In this way, the U.S. Constitution reflects the core concerns of classical liberal philosophy: a government guided by majority rule but providing protection for minority rights.

While the rhetoric surrounding the Revolutionary War and the framing of the Constitution emphasized equality and the inherent rights of man, the founders defined equality quite narrowly. Specifically, at the time of the founding, most states denied the right to vote and other privileges of citizenship to large classes of people, including women and citizens who did not own real property. Perhaps the most striking conflict between the ideals and the reality of the early United States was the institution of slavery.

The same citizens who were willing to fight and die for liberty during the Revolutionary War turned a blind eye to the institution of slavery or, in many cases, actually participated in it. While there were doubtless delegates who held personal moral objections to slavery, serious efforts to abolish slavery would have fragmented the foundling nation. The delegates to the Constitutional Convention discussed the issue of slavery, but the only serious concern was how slaves should be counted for purposes of taxation and representation. The ultimate compromise position—that each slave would count as three-fifths of a free person—remains an embarrassment to the nation.

The terms of the proposed constitution required ratification by nine of the thirteen states. Supporters of the new constitution, known as Federalists, appealed to middle-class merchants and creditors, exhorting the need for economic stability. Many state and local politicians, whose power was threatened by a strong national government, opposed the new constitution; these Anti-Federalists made emotional appeals about the burden of taxation the new government would create and raised the specter of Britain’s tyranny over the colonies.

The Anti-Federalists spread their message through public rallies and through a series of essays published in newspapers across the country. These essays, written under pseudonyms such as “Cato” and “The Federal Farmer,” later became known as the Anti-Federalist Papers. In response, Alexander Hamilton, John Jay, and James Madison collectively penned a series of 85 essays, dubbed the Federalist Papers, which sought to allay fears of government tyranny. These essays stand as perhaps the best defense of the United States’ republican system of government.

Ultimately the Anti-Federalist forces lacked coordination and failed to offer a single, coherent alternative to the new constitution. By January 1788, five of the necessary nine states had ratified the new constitution. The Federalists ultimately attracted additional support by promising to recommend, as a first order of business for the new government, a series of amendments designed to protect individual liberty against the tyranny of the state; these amendments are known as the Bill of Rights. The
Constitution was ratified on June 21, 1788; almost two years later Rhode Island became the last of the original thirteen colonies to ratify the Constitution.

Since its ratification in 1788, the U.S. Constitution has endured remarkably well. Amending the U.S. Constitution is difficult, and this difficulty insulates the document from the most capricious tides of public sentiment, contributing to its stability. Amendments must first be proposed by two-thirds of both chambers of Congress or by a convention called by two-thirds of the state legislatures; ratification then requires approval from three-fourths of the states. Apart from the Bill of Rights, the United States has ratified only seventeen constitutional amendments. Most of the successful amendments have expanded the franchise or involved the administration of government; generally, efforts to amend the Constitution to implement social policy have failed. There are, however, two notable exceptions.

First, in the wake of the United States Civil War, the nation ratified three constitutional amendments related to the issues of race and slavery. The Thirteenth Amendment abolished slavery and involuntary servitude. The Fourteenth Amendment guaranteed citizens equal protection under the law and required the states to afford citizens due process. The Fifteenth Amendment required the states to extend the right to vote to all adult men, regardless of race or previous condition of servitude. Collectively, these amendments radically changed the social structure of the United States; while racial equality continued to evolve for the next century and, indeed, continues to elude the United States, these amendments have served as a moral compass pointing toward true equality.

The other successful attempt to regulate social policy through constitutional amendment was, frankly, only successful for a brief moment in time. In 1919 the United States ratified the Eighteenth Amendment, which prohibited the manufacture, sale, and trade of intoxicating liquors. For the next fourteen years, this policy—known as Prohibition—created a black market for alcohol and contributed to a dramatic increase in organized crime. In 1933 the Twenty-First Amendment, which repealed the Eighteenth, was ratified.

While the Constitution is stable, it is not rigid. Rather, interpretation of the Constitution has adapted to changing social and political circumstances, and thus insured its continued political viability. Specifically, the U.S. Supreme Court, through the mechanism of judicial review, interprets the U.S. Constitution, and fluidity in its interpretation has allowed the Constitution to bend to adapt to political demands.

For example, the equal protection and due process provisions of the Fourteenth Amendment—which were intended to protect racial minorities from mistreatment and discrimination—were construed by the Supreme Court to provide protection to large economic interests. Similarly, the Supreme Court has repeatedly recognized a “right to privacy” implicit in the protections of the First, Fourth, Fifth, and Fourteenth Amendments; the Supreme Court has determined that this right to privacy essentially protects most sexual and reproductive decisions from government interference.

Ultimately, the U.S. Constitution is a document born of necessity and compromise, but it has proven remarkably robust and resilient. As society and technology have evolved, the Constitution, too, has evolved. But its evolution has occurred, primarily, through changing interpretation of static language. As a result, the Constitution has adapted but its essential character—the basic principles of liberty, equality, and democracy reflected in its language—has endured.

CONSTITUTIONAL COURTS
Although Alexander Hamilton, one of the founders of the oldest constitutional court, promoted the judiciary as the “least dangerous” branch of government in 1788 (The Federalist No. 78), judicial practice has since proven that constitutional courts have considerable power potential and are less feeble than Hamilton suggested. Since the mid-twentieth century, constitutional courts have become particularly popular features in the constitutions of newly democratized states, specifically due to their potential to powerfully constrain the other governmental branches. In these states, constitutional courts carry the burden
Constitutional courts may have such political impact because they are specialized tribunals, charged (either exclusively or as the highest appellate court) with upholding the constitution and exercising judicial review by invalidating any legislative acts (or government actions) violating constitutional mandates. However, two schools of thought disagree whether this renders constitutional courts effective policymakers.

One school, known as the **dynamic court** view, holds that the exalted position of constitutional courts within the political system makes them more powerful than policymakers in other governmental institutions. However, this causes these courts to clash with other branches of government, producing what Alexander M. Bickel (1986) calls the **countermajoritarian difficulty**. Because they are not popularly elected, constitutional courts typically enjoy considerable independence from political pressures while wielding the power to invalidate acts of the popularly elected branches of government, frustrating the will of the (legislative) majority. Thus, their ability to shape public policies by setting constitutionally allowable parameters for legislation without being subject to traditional mechanisms of democratic accountability has prompted allegations of judicial activism.

In contrast, a second school of thought known as the **constrained court** view (Rosenberg 1991) argues that even the powerful U.S. Supreme Court is rarely able to effect social change because it is too constrained by the Constitution, by other institutions of government, and by its lack of policy-development tools. This school of thought is unconcerned about the countermajoritarian difficulty.

Notwithstanding this debate, constitutional courts are generally believed to have some (though not completely unrestrained) powers that may allow them to be effective guarantors of a democratic constitutional order. Scholars have begun to specify factors boosting a court’s political power, including a store of political capital; the court’s ability to pick from a wide range of cases (e.g., through generous standing rules, through the powers of both concrete and abstract review, as well as through a posteriori and a priori review), while being able to limit the docket; and the court’s insulation from political pressures (e.g., through long terms of office). Neither centralized nor diffuse systems of judicial review appear to present power advantages to the court.

Interestingly, some constitutional courts established their power through their own rulings (c.f. the U.S. Supreme Court in *Marbury v. Madison* [1803], or the European Court of Justice in *Costa v. ENEL* [1964]), rather than through explicit constitutional empowerment clauses. Some observers, such as C. Neal Tate and Torbjörn Vallinder, even detect a significant global trend toward the “judicialization of politics” (1995, p. 5) that increasingly puts constitutional (and ordinary) courts in the limelight of political conflict. Consequently, political analysis is no longer complete without a consideration of constitutional courts as political actors.

**CONSTITUTIONALISM**

Modern nation-states enact constitutions to bring society from its natural state of chaos to organization based on the rule of law. Unlike the war of all against all described by the English philosopher Thomas Hobbes (1588–1679), John Locke’s (1632–1704) view of the state of nature recognized that humans have organized in family and cultural units throughout history. Though unnecessary for protection from outsiders, society could benefit from a *social contract*. Participants must agree to create structure (a legislature to make decisions), to designate an impartial judge, and to establish enforcement powers (an executive branch) in order to sustain a peaceful society. These entities, according to Locke, can only be created through the efforts of the members of a society to contract for continued institutional support.

The social contract is often embodied by a constitution, a set of principles by which a group of people agrees to govern and be governed. In order to operate as a constitution, these rules need not take the form of a written document. The social contract metaphor is limited in several ways, including, in most circumstances, the lack of...
Constitutions

third-party enforcement. It is more important that constitutional law represents the conventions accepted in a society, and that societal order is coordinated around these conventions. A “dualist” understanding views constitutions as frameworks within which other politics and institutions operate. They establish second-order rules that must be followed when making more specific laws.

By constraining rulers, constitutions aim to protect citizens’ rights. When a constitution stipulates judicial review, citizens can petition courts to invalidate laws that violate constitutional principles. Although, as with the unwritten British constitution, not all provisions are judicially enforceable, they may nonetheless serve as focal points for legal interpretation and political debate, as well as indicators of which government interventions will be accepted by citizens.

A constitution serves, in some sense, to codify existing social relations. Constitutional design, therefore, is constrained by internal and external power dynamics. Resulting agreements reflect these relationships rather than pure legal ideals. As a result, underrepresented groups continue to be excluded, unless they gain influence by extraconstitutional means.

Russell Hardin (1999) sees constitutions more as models of mutual advantage than as binding contracts. It is usually in the best interest of all parties to uphold the rules that maintain order within their society. There are relatively few occasions when it would be more difficult to follow existing rules than to renegotiate the terms of a constitution.

Those rare circumstances on which recodification is less costly for society are constitutional moments (Ackerman 1991). Changes in power alignments, in relation to internal politics or external influence, may necessitate a change in the substance of a constitution. These moments may involve major amendment to an existing constitution, as in the post–Civil War United States, or they may require a complete overhaul of the constitution, as in South Africa following the inclusion of the black population as full citizens in the 1990s. At these times, questions of legitimacy arise because the constitutional authors have not been elected by a process representing the new social contract, and may not represent the people who will be bound by the new document. If a new constitution is to remain a stable set of rules for the polity, it must represent a credible commitment by citizens and leaders who will not have an incentive to override or renegotiate it, or resort to violence. Such constitutional moments may arise in the context of postwar reconstruction, independence movements, domestic upheaval, or union of existing polities. In each situation, citizens encounter distributional gains and losses reflecting societal change.

CONSTITUTIONS

Constitutions can be defined as a set of rules that aim at regulating the channels of access to principal government positions, the allocation of powers among different branches of government, and the rights of citizens. Most constitutions also include rules establishing procedures for their own amendment and the conditions under which constitutional provisions can be suspended.

Nearly all countries in the contemporary world have written constitutions, often identified as the “fundamental law.” Even for these countries, however, it would be misleading to restrict the constitution to a single document so named. Some of the rules that create the structures of government and delimit their authority are also contained in statute law (such as laws establishing the jurisdiction and powers of governmental departments or independent agencies) and in judicial decisions (such as the rulings of a constitutional court) that are not codified in a single document. In addition, there are always unwritten conventions that regulate the behavior of representatives and citizens, particularly in areas where written rules are silent or unclear. Moreover, most parts of a constitution can be composed of unwritten conventions, as is the case of the United Kingdom, New Zealand, and Israel.

Constitutions generally attempt to prevent the arbitrary use of state power. But there is a wide variation in the degree to which state authorities effectively abide by the constitution. Rulers are more likely to observe a constitution that emerged out of a democratically elected body representing a plurality of political forces. They are also likely to comply with the constitution when citizens agree on the authority of the constitution as a set of impartial procedures for the resolution of conflicts. This consensus, however, is often lacking when societies are divided by overlapping cleavages of an economic, religious, or ethnic nature.

Constitutions that are at least minimally enforced are essential for the existence and legitimacy of democratic
regimes. Citizens would not be free to criticize the government and keep its decisions in check without basic constitutional rules guaranteeing freedom of expression and providing remedies against arbitrary state action. Truly competitive elections could not exist without constitutional rules guaranteeing freedom of assembly and organization.

There is great variation in the way constitutions organize a democratic regime. Constitutional democracies can be presidential, if the chief of government is elected by the people for a fixed term, or parliamentary, if he or she is elected by the assembly and responsible to the legislative majority. Legislative assemblies can be unicameral or bicameral. States can be unitary or federal. Most contemporary constitutions establish independent courts responsible for interpreting the constitution. Constitutional courts, however, vary in organization, composition, and powers. Finally, while the majority of constitutions include amendment rules that attempt to make constitutional reforms more difficult to pass than ordinary laws, these rules can be relatively flexible or extremely rigid.

In the twenty-first century constitutions are implicitly or explicitly central to some of the most important research fields in social sciences. Constitutions and their various designs are considered to have a crucial impact on the stability and quality of democracy, on economic policy and economic performance, and on the rate of policy change in political regimes.

CONSTRAINED CHOICE

Constrained choice occurs when an economic agent must determine the optimal combination of choice variables (given some relationship between combinations of those variables and payoffs) in the face of a constraint limiting the set of feasible combinations for those variables available to the agent. For instance, a consumer seeks to choose the combination within his or her means of consumption goods and services that maximizes welfare. More specifically, if $C_1$ and $C_2$ are the goods for which the consumer must choose the optimal combination, the consumer's problem is to maximize utility ($U(C_1,C_2)$) given a budget constraint: $p_1^*C_1 + p_2^*C_2 \leq M$, where $p_1$ and $p_2$ are the prices of the two goods and $M$ is the consumer's overall income or purchasing power.

The concept of constrained choice has been extended both theoretically and empirically to more elaborate settings. It arises naturally when agents must make forward-looking decisions or when agents are uncertain. For instance, life cycle models of saving and consumption focus on the challenge presented to agents who must maximize discounted lifetime utility given the constraints imposed by current and future income, and prices and opportunities to save or borrow. Agents may face uncertainty in terms of future income and prices, as well as the returns to savings. The simple budget constraint posed must then be recast in intertemporal terms in a fashion that reflects the impact of per period saving or borrowing, as well as uncertainty regarding future income flows, returns to saving, and prices. A common way of approaching this is the value function method, which essentially reduces the rather complex intertemporal problem to a series of two-period problems.

The concept of constrained choice has also been extended to other behavioral settings, such as joint decision-making. For example, household bargaining models attempt to capture a household's members' efforts to maximize their personal utility from the consumption of goods and services, given a limit to overall household purchasing power. The household bargaining example also speaks to alternative approaches to choice. For instance, much of game theory studies interactive decision-making. This approach focuses on the constraints placed on an agent's decision-making by other agents' likely responses to his or her decisions. Thus the agent does not necessarily face a static, internal (to him- or herself) constraint as in the examples previously presented, but other agents' likely reactions to the agent's behavior, and their responses' implications for the agent's own payoff function, effectively constrain his or her behavior.

INTERNATIONAL ENCYCLOPEDIA OF THE SOCIAL SCIENCES, 2ND EDITION
CONSTRUCTIVISM

Although the term constructivism is used as a label for an important movement in art history (as in Russian constructivism), constructivism in the social sciences refers to a distinctive approach to theory and research that is opposed to the dominant empiricist, naturalist, and realist frameworks of mainstream social thought. This general approach is also frequently designated by the terms social constructivism and social constructionism.

The constructivist outlook can be formulated based on three general claims: (1) the ontological thesis that what appears to be “natural” is in reality an effect of social processes and practices; (2) the epistemological thesis that knowledge of social phenomena is itself socially produced; and (3) the methodological thesis that the investigation of the social construction of reality must take priority over all other methodic procedures.

Historically, constructivist epistemologies have opposed both empiricist and realist philosophies of science. Empiricism is rejected for its passive view of mind and its assumption that beliefs and knowledge are formed through associative patterns of theory-neutral “sense data.” Realism—the belief in independently existent objects—is criticized for ignoring the various interpretive and constructive processes through which cognition of objects is actually realized. Against these naïve epistemologies, constructivism commends something like a Copernican revolution in our taken-for-granted ways of conceptualizing knowledge and reality. For the constructivist, cognition is no longer viewed as an objective representation of the real, but is approached as an active construction of reality, shaped by particular interests, actions, representational media, and social practices. Human beings do not merely “adapt” to a preexisting world; rather, as active agents, they participate in the interpretive construction of reality.

One primary form of interpretation can be found in practical interaction mediated by everyday language and communicative forms. Thus, what might seem to be pre-given “natural” categories and relations are seen as products of particular social practices and interests. Moreover, such categories and relations are subject to historical change. Against empiricism and naturalism, constructivists argue that we should see every phenomenal order as the product of active processes of social interaction. The “real,” in other words, is viewed as a construction of agents and productive activities. Whatever beliefs we hold about reality are contextually defined and culturally constructed. Orthodox epistemology and commonsense thinking influenced by it tend to be atomistic, monological, and representational, whereas constructivism is holistic, instrumentalist, and pragmatic.

This conflict between forms of realism and more pragmatic and praxis-oriented worldviews can be traced back to the scientific revolution of the seventeenth century and the thinking of the eighteenth-century Enlightenment. The constructivist spirit was symbolically expressed by a principle that was first proposed by the great Italian philosopher Giambattista Vico (1668–1744)—the verum-factum principle—according to which historians and social theorists can only truly know what has been made or shaped by human intention and design. For Vico, this idea opened the continent of history as a realm of contingent social constructions.

The other important philosophical source of constructivist themes is the antiempiricist critical epistemology formulated by Immanuel Kant (1724–1804) toward the end of the eighteenth century. Against the dominant empiricism of his day, Kant argued that cognition is not a passive reception of sensory data, but is, rather, the outcome of constructive processes of active cognition (involving a priori forms of intuition, categories of the understanding, and so on).

In keeping with the changing forms of empiricism and realism, the development of constructivism in the nineteenth and twentieth centuries took many forms. These include the historicist perspective of historical materialism (with Karl Marx’s [1818–1883] elaboration of a more praxis-based “dialectical” realism); Émile Durkheim’s (1858–1917) image of the social as a collective “social fact”; the verstehende or interpretive sociology defended by Wilhelm Dilthey (1833–1911), Georg Simmel (1858–1918), and Max Weber (1864–1920); Edmund Husserl’s (1859–1938) transcendental phenomenology; the philosophical hermeneutics associated with the philosophers Hans-Georg Gadamer (1900–2002) and Paul Ricoeur (1913–2005); the social phenomenology of Alfred Schutz (1899–1959); the sociology of knowledge represented by Karl Mannheim (1893–1947); and a range of interpretive sociologies influenced by these thinkers. Perhaps the seminal text in post–World War II (1939–1945) American sociology was Peter Berger and Thomas Luckmann’s The Social Construction of Reality (1966), which developed a sociology of knowledge synthesized from Marxist, Durkheimian, Meadian, and phenomenological traditions.
Constructivism became an influential current of thought in the 1960s and 1970s as it converged with new approaches to the understanding of the constitutive rules and regulatory processes that inform the framework of social life. This was particularly important in so-called labeling theories of deviance and the “new criminology”; in debates about the symbolic sources of social identity (in the symbolic interactionist tradition); in the study of stereotyping, prejudice, and authoritarianism in the field of ethnicity and race relations; in the renewed concern with the historical and political construction of sexuality and gender relations (associated, in particular, with feminist sociology); and in the emergence of more microsociological inquiries into the negotiated character of everyday social orders.

The constructivist outlook has had a major impact in shaping the landscape of contemporary intellectual life. Among the most important fields influenced by constructivism are: semiotics and structuralism, critical theory, general systems theory, structuration theory, postmodern theory, and gender theory.

In semiotics and structuralism, the structuralist movement explicitly embraces the constructive role of language and other cultural systems as reality-shaping forms of social production and reproduction (in terminology derived from Ferdinand de Saussure [1857–1913], language becomes a differential system of meaning construction). In psychology, Jean Piaget’s (1896–1980) structuralism provided one of the first explicit constructivist conceptions of human cognition, learning, and socialization, and James Gibson’s (1904–1979) theory of active affordances has led to constructivist research in perception and cognition (Gibson 1966).

In critical theory, the revision of historical materialism began with the Frankfurt School and continued under Jürgen Habermas and his students. Habermas’s differentiation of knowledge into three basic interest-defined types—instrumental (knowledge constructed in relation to work and labor), interpretive-hermeneutic (knowledge concerned with practical understanding in social life), and emancipative (knowledge linked to social criticism and change)—is an example of constructivism in critical theory.

In general systems theory, societies actively construct their “environments” through cultural codes and representations. Structuration perspectives take as their theme the variable practices and differential processes of culturally mediated world construction. Examples of the latter are the “structuration” theories of society in the work of Pierre Bourdieu (1930–2002) and Anthony Giddens, and the closely related genealogical investigations of power/discourse formations associated with the work of Michel Foucault (1926–1984). Constructivism in postmodern theory is represented by the theory of language-games in Jean-François Lyotard (1924–1998) and the theory of simulation and hyperreality formulated by Jean Baudrillard. Gender theory has become especially marked in accounts of the discourse-constructed character of gendered identities, sexual inequalities, and patriarchal power influenced by post-structuralist theories of language.

Constructivist approaches can be found in a wide range of perspectives in contemporary social thought. The first and most pervasive is the so-called linguistic turn within contemporary philosophy and, closely linked to this, the “cultural” turn across all the social sciences. This insight into the radically constitutive implications of cultural processes challenges naturalistic methodologies by demonstrating the way in which all social relations and spheres of society are culturally produced, organized, and reproduced (Burr 1995; Gergen 1999). One example is the influence of a type of discursive “genealogy” influenced by the writings of Foucault (in essence, Foucault’s studies of disciplinary practices are inquiries into the discursive construction of “normal” schooling, penal practices, clinical medicine, and so on). In moving from a framework of individual construction (for example, the early work of Piaget) to theories of social construction, we emerge with a more radical sociology of the frameworks of knowledge viewed as cultural formations.

It is no exaggeration to say that a field such as ethnicity or “race” relations has been transformed by constructivist approaches to the discourses of “racial” differences and “racialized” inequalities and disadvantage. The history and sociology of racism has developed in ways that demonstrate how particular categories of ethnic difference have been constructed historically in order to sustain particular systems of domination. Viewing human groups in terms of “races” is a relatively recent example of the violence that can be inflicted upon populations and whole societies by social categories. Every ideology based upon a belief in the innate or culturally prescribed inferiority of one group defined by some physical attribute, characteristic, or trait is seen as an example of wider processes of socially mediated power and domination. Constructivism thus not only offers new avenues of research into the workings of racist discourse but also has led to a renewed sense of the ethical and political problems inherent in using “racial” terms and ethnic stereotypes. Divisions between groups and communities based upon such discourses are primary examples of socially constructed relations. The problem of institutionalized discrimination and how such inequalities are maintained by racialized discourse is seen as being central to the workings of power and domination in society (an insight that has led to renewed interest in the historical dynamics of colonial and postcolonial systems).
Constructivism

Another field in which constructivist approaches have been highly productive is the branch of microsociology inspired by the writings of Harold Garfinkel, Aaron Cicourel, David Sudnow, and Harvey Sacks. Their work has led to the emergence of a distinctive framework of research concerned with the sense-making activities of everyday discourse and conversation (usually referred to as conversation analysis). Discourse perspectives have also been influential in social psychology (as seen, for example, in the work of Jonathan Potter and Margaret Wetherell), including the explicitly social understandings of debates in experimental and physical science (Mulkay 1979; Knorr-Cetina 1981; Latour and Woolgar 1986), as well as the constructivist sociology of science associated with the Edinburgh School and approaches to the symbolic construction of organizations and organizational cultures (for example, in Karl Weick’s Sensemaking in Organizations [1995]). Further analysis of the constructivist program would need to distinguish between the different varieties of sociological and phenomenological constructivism, symbolic interactionism (Plummer 2000), linguistic constructivism, moderate and radical constructivism, and more ideologically sensitive discourse-theoretical models of knowledge construction (Gadamer 1975; Edwards and Potter 1992; Gergen 1982 and 1999; Grint and Woolgar 1997; Potter 1996; Potter and Wetherell 1987).

Social constructivist approaches have actively transformed almost every subdisciplinary field within sociology and, more creatively, given rise to new research configurations and inquiries, most particularly associated with the sociology of the body, the self, cultural identity, and systems of difference. These approaches are most explicitly evident in the concept of embodiment regarded as a symbolically mediated process (Shotter 1993; Shotter and Gergen 1988); discursive psychology (Edwards and Potter 1992; Potter and Wetherell 1987); the symbolic dynamics of social identity and identity construction (Levine 1992; Bayer and Shotter 1998); the sociology of sex roles, sexuality, gender, and gender socialization (Burr 1998); critical investigations of ethnicity, racism, sexism, prejudice, and stereotyping (Billig 1991); the social construction of health and illness (White 2002); and more radical programs of reflexive social theory into the different forms of power and domination in everyday life and society (Sandaywell 1996; Steier 1991). All of these approaches depend upon a more critical understanding of the historical dynamics of the construction of identity and difference in and as social relations. The challenge faced by contemporary constructivism is to open dialogues with these new problematics and to develop more reflexive frameworks that respect the constructive processes of social existence.

CONSUMER

The consumer plays a central role in mainstream economic analysis. This analysis explains economic behavior in terms of individual optimization, and the consumer, who buys and uses goods and services to maximize utility or seeks his or her highest level of satisfaction given the constraints he or she faces, is a central locus of decision making. Mainstream economics is often defined as the subject that examines how scarce resources are allocated to alternative uses to satisfy human wants, and these wants are embodied in the preferences of the consumer. Many of the key ideas of mainstream economics—such as the existence of general equilibrium in a market economy, and its property that this equilibrium is socially efficient—can be illustrated with economic models in which the only economic agents are consumers with given endowments of goods, interacting with others through market exchanges (without the producer, the other important agent in economics).

BASIC THEORY OF THE CONSUMER

The basic theory of the consumer examines an economic agent with a preference ordering over bundles of consumer goods. It is assumed that this ordering is complete (i.e., that the consumer can order all possible alternatives), reflexive, and transitive, and that more of any good is preferred to less (Barten and Bohm 1982). Under these assumptions the consumer’s preferences can be represented by a utility function that assigns a real value to commodity bundles

$$U = U(q_1, q_2, \ldots, q_n)$$

where utility, $U$, increases with the quantity of each of $N$ goods consumed, $q_i$. The consumer is also assumed to have a budget constraint given by $p_1q_1 + p_2q_2 + \ldots + p_nq_n \leq Y$,

where $p_i$ denotes the (money) price of good $i$, exogenously given to the consumer, and $Y$ is the (money) income of the consumer. The consumer is also assumed to maximize utility by choosing quantities of goods consumed, $q_i$. The solution of this maximization problem is usually shown for the case of two goods ($N = 2$) with an indifference curve diagram as shown in the figure above, where the line $BB$ is the consumer’s budget line, which shows combinations of consumption bundles that satisfy the budget constraint with an equality (with the consumer spending his or her entire income) and the curves marked $U$ are indifference curves, each one denoting a particular level of utility of satisfaction for the consumer, and drawn “smooth” and convex to the origin to show that consumers prefer “mixed” baskets to baskets containing a large amount of one good.

The consumer maximizes utility or reaches his or her highest level of satisfaction at the bundle $E$, which is the consumer’s equilibrium. At equilibrium, the consumer equates the price ratio, $p_1/p_2$, the slope of the budget line, which shows the rate at which the consumer can substitute between the two goods at their prevailing prices, to the marginal rate of substitution between the two goods, the slope of the indifference curve, which shows the rate at which the consumer prefers to substitute between them to leave utility unchanged. In the general case with more than two goods, the consumer’s equilibrium requires that the price ratio between any two goods is equated to the marginal rate of substitution between them.

This basic theory has a number of implications. First, given prices and preferences, an increase in income shifts the budget line outwards without changing its slope and increases the consumption of all goods if they are “normal” goods, and increases the consumer’s utility. For some goods it may be that the quantity demand falls with income; these are called inferior goods. Second, other things remaining constant, a fall in the price of a good rotates the budget line outwards and increases the consumption of that good, provided it is a “normal” good. This increase occurs both because the relatively lower price of the good makes the consumer substitute away...
from the other good along an indifference curve (the “substitution effect”), and because the lower price in effect increases the real income of the consumer, inducing him or her to buy more of all goods (the “income effect”). This yields the consumer’s demand function and curve showing the relation between the price and quantity consumed of a good. This, when aggregated over all individuals in the market, provides the market demand function and curve of the good. If the good is inferior, it is possible that the fall in the price of the good can lead to a fall in the quantity of the good consumed, with the consumer buying less of the good because he or she feels richer. Third, if the prices of all goods and the consumer’s income change by the same proportion, the budget line will be unchanged, and the consumer will choose the same bundle. In other words, consumer demand is homogenous of degree zero in income and prices, which is known as the homogeneity property. Fourth, a shift in preferences favoring a good shifts the indifference curves towards the axis that measures the quantity of that good, and increases the consumption of that good.

ALTERNATIVE APPROACHES

This discussion has used utility and the level of satisfaction interchangeably. However, the early analysis of the consumer provided a hedonic interpretation of utility, identified it with pleasure, and took it to be cardinally measurable (Stigler 1950). It was assumed that utility increases with the level of consumption of a good, so that marginal utility—the change in utility due to the change in the quantity of a good consumed—is positive, but increases at a diminishing rate, so that marginal utility diminishes with increases in consumption. In this approach consumer equilibrium occurs when the marginal utility obtained from a commodity divided by its price is the same for all commodities. This equilibrium implies that an additional unit of money is allocated over different goods in such a way that it yields the same additional utility.

Concern with cardinal measurability led to the development of the ordinal utility theory of the consumer, with early contributions by Vilfredo Pareto (1909) and Eugene Slutsky (1915), and with later developments by John R. Hicks (1934) and Roy G. D. Allen (1934). In this theory, the concept of diminishing marginal utility is not meaningful, and is replaced by the assumption of the diminishing marginal substitution (which states that the amount of a good that the consumer requires to stay at the same level of utility when he or she gives up a unit of another good increases as the consumer has more of the latter good), which is equivalent to indifference curves being convex to the origin. The implications of changes in income, prices, and preferences are the same with this approach as with the earlier one, without requiring the stronger assumption of cardinally measurable utility. The marginal rate of substitution between two goods is equivalent to the ratio of their marginal utilities.

The assumptions required for analyzing consumer behavior using Paul A. Samuelson’s revealed preference approach (1938) are even less stringent, with no utility functions being assumed. Only the implications of observed behavior and the consistency of preferences are used to develop consumer theory.

Despite this trend towards requiring fewer assumptions, some analyses of consumer behavior, for example the examination of decision making in risky situations, and the evaluation of the well-being of the consumer, require stronger assumptions about the measurability of utility.

APPLICATIONS

The basic theory of the consumer has found many applications in economics (and even outside it) by suitable interpretations of “goods.” The choice made by the consumer between consumption and leisure treats leisure as a good and takes into account the time constraint faced by the consumer that is allocated to work (which yields income) and leisure (which provides satisfaction but not income). This analysis is used to examine the labor-supply decision of the consumer. The choice made by the consumer between consumption in one period and consumption in the next (assuming a two-period life of the consumer, for simplicity) addresses the intertemporal dimension of the consumption-saving decision, with the relative price of consumption this period being determined by the interest that is yielded by savings. The additional amount of the good in the next period with which the consumer must be compensated (so that the consumer’s level of utility does not change) for giving up a unit of the good this period is assumed to be greater than one by an amount that is called the consumer’s rate of time preference, which measures the consumer’s degree of impatience. In this theory, an increase in the interest rate reduces consumption in this period and increases saving through the substitution effect by making consumption this period more expensive, but it may reduce saving through the income effect of making the consumer increase consumption now. More generally, the consumer can be assumed to have a life-time horizon of longer than two periods. Sometimes the time horizon is taken to be infinitely long. The approach is used to examine choice when the consequence of choices is not certain. It is assumed that the outcome of a choice has a probability distribution, and the consumer maximizes expected utility, that is, the utility derived from each possible outcome weighted by its probability of occurrence. The approach is
also used in the analysis of the portfolio choice among different assets for the asset-holding consumer. For example, if the consumer prefers higher returns to assets and lower risk, the consumer is taken to have a utility function over return and risk. Given the return and risk characteristics of different assets, the consumer can then choose the overall return and risk of his or her portfolio, and hence the allocation of wealth among different assets.

**EMPIRICAL ISSUES**

The empirical analysis of consumer behavior traditionally has been conducted using econometric methods, with the estimation of demand curves for particular products and systems of demand functions. This type of empirical work usually refers to an aggregate of consumers—for example, to all consumers in a country. Because the theoretical implications regarding individual consumers do not carry over to aggregates, additional theoretical assumptions, implying the existence of a representative consumer, are sometimes used to translate the theory regarding individual consumers to aggregate data. More recently, empirical estimation at the individual level has been conducted using survey and experimental data, as mentioned below.

The inverse relation between quantity demand of a product and its price has been repeatedly confirmed by the evidence. Charles Davenant’s 1699 estimation of an inverse relation between the price of corn and the amount harvested is perhaps its earliest example. Subsequent attempts at estimating the demand functions for individual products and systems of demand functions yield the same result. Although the so-called “Giffen good,” for which the quantity demand rises with the price, has been much discussed, no such empirical relationship has actually been documented.

This, however, should not be taken to imply that basic theory of consumer behavior is validated by empirical evidence. As mentioned earlier, the theory does not necessarily imply that quantity demanded falls with the price. Moreover, as shown by Gary Becker (1962), the inverse relation between price and quantity demanded can be explained in terms of individual behavior that is totally random (though restricted by the consumer’s budget constraint) or determined by habit (as long as the consumer can afford to be governed by it), rather than by optimization, as assumed in consumer theory. Some other aspects of consumer theory do not seem to be consistent with empirical evidence. For instance, the homogeneity property is not usually confirmed. Survey evidence suggests that levels of utility as measured by self-reported indicators of happiness do not rise with the level of consumption and income, at least beyond a certain point. This casts doubt on the assumption that increases in consumption imply increases in utility. The usefulness of empirical work on consumer behavior arguably lies not in testing the validity of consumer theory but in exploring empirical regularities such as the well-established Engel’s law, which finds that people spend a smaller proportion of their budget on food as their income rises.

**CRITICISMS AND DEVELOPMENTS**

The theory of the consumer has been criticized from numerous angles, some of which have prompted its modification. Three may be briefly mentioned.

First, it is not clear who the consumer, the decision-making agent, really is. Given the preoccupation of mainstream economic theory with the optimizing agent, it is natural to interpret the consumer as an individual person. However, in studies of consumer behavior the consumer is often taken to be the household, or family, or even in some cases the family dynasty; this often leads to ignoring intrafamily differences. Even the idea of the individual as the consumer may be problematic if individuals are thought of as having multiple selves (Elster 1986).

Second, the notion that consumers can actually choose optimally over all possible consumption bundles has been criticized on the grounds that (1) they do not have easy access to all relevant information; (2) in uncertain environments they are unable to calculate realistic probabilities of outcomes; and (3) they do not have the information-processing capability of computing the optimal outcomes even if they had all the necessary information. Herbert A. Simon (1955) has argued that consumers and other economic agents are “satisficers” (a term he coined) rather than optimizers, in that they try to achieve satisfactory rather than optimal outcomes, and that they have, at best, bounded rationality. Because what is satisfactory is not as well defined as what is optimal, this approach has led to research on how consumers actually behave, using survey and experimental data. This research suggests that actual consumer behavior can deviate from what is considered optimizing behavior. For example, consumers give more weight to actual money costs than to opportunity costs (contrary to much of consumer theory), are more averse to gains than to losses, give greater weight to their own experiences and those of others that they know personally than to more objective data in making decisions in uncertain situations, and are myopic about the future.

Third, the notion that consumers have exogenously given preferences over commodity bundles flies in the face of evidence that people are affected by advertising, that they form habits that are difficult to break, and that they are affected by the behavior of other consumers. Many of these ideas can be incorporated into consumption theory by modifying it suitably. For example, it has been argued that a consumer’s utility depends not only on the absolute
level of consumption of the consumers, but also on what he or she consumes relative to other consumers (especially peers), and this may occur because of information issues, network externalities, and status. Although this modification can be made within the optimizing framework of consumer theory, it may have implications very different from it. For example, individual optimization may be inconsistent with social optimality (i.e., everyone could be better off if they consumed less and enjoyed more leisure, but they are prevented from achieving this outcome because they value their relative consumption level), and people may not be significantly (or even not at all) better off with significant increases in consumption (as mentioned earlier) when others consume more as well (Frank 1999).

**CONSUMER PROTECTION**

Typically, competition aligns the interests of producers with those of consumers. Consumers want higher quality and less costly products, and producers have an incentive to provide them because, if they do not, their rivals will. However, this alignment can break down in a variety of circumstances. For example, if consumers lack information about quality or price, they can end up purchasing products they would not have otherwise wanted. If there are enough uninformed consumers, producers may have the incentive to set prices that are too high or quality that is too low.

Consumer protection laws and regulations are designed to realign the incentives of producers with the goals of consumers by preventing certain kinds of firm behavior, like deceptive advertising, and by mandating others, like information disclosures. However, these regulations also raise costs, so assessing whether consumers are better off under these regulations requires careful benefit-cost analysis.

For example, in 2005 the European Commission required that airlines compensate passengers in the event of canceled flights, regardless of the cause. So when airlines sell tickets, they must bundle what amounts to trip insurance with the tickets. Consumers are better off if the price of airline tickets goes up by less than the value that consumers place on the trip insurance. But if some consumers value trip insurance while others do not, then unbundling tickets from insurance may be a better solution, as it allows those consumers who do not value the flight insurance to purchase tickets without it. Finally, there is the consideration of safety. If airlines were forced to pay more for canceled flights, one would expect to see more flights in bad weather, with a corresponding decrease in safety. Balancing all of these considerations is necessary to determine whether the regulation helps or hurts consumers.

Consumer protection agencies want to enforce regulations and laws where there is the biggest net benefit, and this has led them to focus most of their enforcement resources on prosecuting deception. If sellers misrepresent their products or services, mislead consumers about the terms of the bargain, or unilaterally try to change those terms postpurchase, then transactions can occur that reduce welfare. Such behavior is most likely where products are infrequently purchased, where claimed characteristics of the product are not verifiable by consumers or rival sellers at low cost, where seller reputations are unimportant for profitable sales, or where buyers are particularly vulnerable or gullible. Governments focus much of their consumer protection efforts on such markets. In this role, government can act as an efficient agent for the mass

**Amitava Krishna Dutt**
of consumers who might have suffered injury, but do not pursue individual legal remedies because of the cost. Governments attempt to obtain remedies that will correct the wrong, and also efficiently deter future violations by the offending firm (called specific deterrence) and others (called general deterrence).

Beyond simply deterring deception, consumer protection actions can sometimes improve market outcomes through the provision of information (e.g., health warnings by governments or by firms), by development of standard metrics that make consumer shopping and market competition more efficient (e.g., uniform interest rate calculations), or by regulating the conditions for sale of valuable, but potentially unsafe, products or services (e.g., minimum quality standards for drugs, or vehicle tires). Also, in instances of extreme consumer susceptibility, governments sometimes intervene to regulate the terms of implicit or explicit contracts (e.g., “at need” funeral purchases, unmonitored marketing to children, or mandatory waiting periods for finalizing mortgages).

Early-twenty-first-century changes in consumer protection laws and enforcement have been caused by the migration of advertising away from magazines and newspapers to broadcast radio and TV, cable, direct mail, telephones, and the Internet. Because the newer media span the globe and because retail marketing by distant sellers has become more common, consumer protection has become an international and multilingual endeavor, with cross-border partnerships being formed by regulators from different nations. Law revisions are designed to more efficiently deter deception, but some are aimed at ensuring consumer privacy. One of the most effective efforts is the 2003 Do Not Call rule that allowed U.S. consumers to choose to avoid a large portion of marketing calls. By 2005 more than 100 million Americans chose to have their phone number included on the list, allowing them to avoid unwanted telemarketing calls.

In the United States, consumer protection laws began in the early 1900s, by protecting competitors—not consumers—from damage resulting from rivals’ deceptive claims. Over time, the law became more centered on harm to consumers, but the fear of monopoly power was often the only effect economists considered. Systematic thought about the economics of consumer issues began with George Stigler’s 1961 paper inviting academics to think about how information and advertising might play a positive role in shaping market outcomes. At the same time, economist, social reformer, and U.S. Senator Paul H. Douglas (D-IL) drafted one of the first major consumer information rules—the Truth in Lending Act—that was enacted by Congress in 1968. A decade later, a small group of economists began working on consumer issues at the U.S. Federal Trade Commission.

CONSUMER SOVEREIGNTY

SEE Value, Subjective.
CONSUMER SURPLUS

Consumer surplus, following the French economist and engineer Jules Dupuit (1804–1866) and the British economist Alfred Marshall (1842–1924), is a monetary measure of the benefits to consumers from being able to buy what they want at the going price. It is used to evaluate the gains from policy changes: cost-benefit analysis recognizes that much of the benefit may accrue in the form of surplus and so is not measured in actual market transactions. Consumer surplus is traditionally depicted as the area below the (ordinary, or Marshallian) demand curve and above the horizontal line representing price.

To illustrate, suppose that there are ten people whose individual reservation values (maximum willingness to pay) range from $10 down to $1 in one-dollar decrements. All consumers with reservation values above the market price buy, and each buyer enjoys a surplus equal to his or her reservation value minus the amount paid. So, if the market price is $6.50, four consumers buy, with surpluses ranging from $0.50 to $3.50, for a total (aggregate) consumer surplus of $8. This consumer surplus equals the gross benefit ($34 in the above example) minus consumer expenditures. A drop in price to $5.50 raises consumer surplus to $12.50: $1 extra accrues to each previous consumer directly from the price reduction, and one more consumer (who then enjoys $0.50 surplus) is induced to buy.

The same idea applies to a consumer buying several units of a good (or when many consumers each buy several units). Suppose the demand system described above represents the valuations of a single consumer for successive units purchased: the consumer will buy until the value of another unit falls below the price charged. At a price of $6.50, she buys four units and enjoys $8 in surplus. A price drop to $5.50 will induce her to buy more. Her surplus gain is $4.50 (more than the $4 saved on the previous four units). While the marginal unit purchased is valued at the price, all other (inframarginal) units provide surplus. Total consumer surplus aggregates these gains over all units purchased by all buyers.

The simple procedure described above gives the exact measure of the true benefit to consumers only under certain restrictive conditions. If there are “wealth effects,” the consumer’s willingness to pay for the marginal unit changes with the amount paid for the previous units. There is, thus, not just one measure of surplus change, but many. Most prominent are the equivalent variation (the additional money needed to make the consumer just as well off as the price change) and the compensating variation (the money that could be taken away after the price change to leave the consumer as well off as before). The consumer surplus change is bracketed between the equivalent and compensating variations. Fortunately, for small changes or when the good in question attracts a small fraction of expenditure, it has been shown that these three measures give similar results.

Consumer surplus counts $1 in surplus the same irrespective of how deserving the recipient might be. Critics argue that it overemphasizes the preferences of the wealthy, insofar as they have greater willingness to pay. Defenders of consumer surplus argue that it is useful in measuring economic efficiency, while redistribution issues should be addressed separately.

CONSUMERISM

Consumerism may be defined as a belief system that promotes high and rising levels of the personal consumption of material goods and services among a large segment of the population, ascribing to consumption a central role in promoting individual happiness. It is also associated with the view that the main goal of the economy should be to meet the (freely chosen) consumption decisions of people in the most efficient way.

It can be argued that economic development necessarily leads to consumerism. According to this view, the inherent competitiveness of people—which makes them try to stay ahead of, or at least to keep up with, the consumption of others—induces people to consume far beyond what is necessary for them, and to give consumption more importance in their lives when economic advancement makes this possible. This does not follow, however, since people need not increase their consumption significantly or attach much importance to consumption if they react to economic growth by increasing their consumption of others—induces people to consume far beyond what is necessary for them, and to give consumption more importance in their lives when economic advancement makes this possible. This does not follow, however, since people need not increase their consumption more or to devoting more resources to nonrival consumption goods (like museums and public parks), or if they compete in spheres other than consumption. This appears to be confirmed by the fact that despite the wide reach of consumerism in the contemporary world, there are significant variations in its intensity (between, say, the...
United States and Europe). Indeed, explanations of the emergence and growth of consumerism in the past have been sought in the weakening of traditional religious values and in the efforts of rising commercial and industrial interests to increase their profits by increasing the demand for their products. The spread of consumerism around the world, including to less-developed countries, can be explained in terms of globalization made possible in large part by technological changes that allow the easier spread of information (thereby strengthening what has been called the international demonstration effect) and by free market economic policies (such as free trade and fewer labor market regulations, which seek to allow consumers to obtain goods at lower prices).

Consumerism has been criticized by many, including religious leaders, moral philosophers, socialists, and environmentalists, for: diverting people’s attention from arguably more noble goals, such as spiritual development; saving less and thereby slowing down economic growth that can benefit society; making people self-centered and willing to do less for others in society who are less fortunate than themselves; exacerbating inequality by inducing the poor to reduce saving and human capital formation, become more indebted, and accept an inequitable socioeconomic order; and harming the natural environment. However, it has also had its defenders. The critics have been dismissed as elitist in not recognizing the democratic appeal of the spread of consumerism and its ability to give pleasure, even of an artistic and spiritual kind, and of failing to show why some goods are necessities and others are luxuries. Consumerism has been applauded for providing people with incentives for hard work to improve their lives, for keeping profits up by causing a growth in the aggregate demand for goods and services, and for being the driving force for economic growth and for all the benefits it brings about.

While much of this debate has focused on the appropriate meaning of “the good life” and on the effects of consumerism on society, a recent literature, making use of self-reported happiness surveys, addresses directly whether higher levels of income and consumption actually make people happier by their own reckoning. This literature suggests that although the rich report higher levels of happiness than the poor in a given society, across countries increases in material well-being do not make people significantly happier beyond a certain threshold level of real income, and that in economically advanced countries increases in income and consumption do not significantly increase happiness. The finding that the growth of luxury consumption has not led to increases in happiness has been explained in a number of ways. Since people get habituated to higher levels of living and consumption norms, and because more goods and services are required to satisfy the same needs as average income increases (for instance people need better clothing to be socially acceptable), higher actual levels of consumption need not make them happier. To the extent that people consume more to obtain higher status by consuming more than others they expend more effort and experience more stress without improving their position because others do the same. The quest for more consumption leaves people less time to enjoy what they consume, less time for friends and family, and causes them to lose social connectedness, having an adverse effect on their happiness.

CONSUMPTION

The study of consumption is important in many fields of social science, including anthropology, sociology, economics, and psychology. A key definition of consumption is one that reflects our use of the term in daily life. That is, consumption may be defined as the personal expenditure of individuals and families that involves the selection, usage, and disposal or reuse of goods and services. In this respect, we are all consumers, choosing and using goods and services, which we pay for with earnings, savings, or credit.

As late as the last century, the term was primarily linked to disease: consumption was another term used to describe pulmonary tuberculosis (TB). Because of this fact, as well as the conventional use of the term to designate wasting or destruction, consumption had a decidedly

INTERNATIONAL ENCYCLOPEDIA OF THE SOCIAL SCIENCES, 2ND EDITION
negative connotation until the middle to late twentieth century.

While there is a tendency to associate consumption of goods and services with modernity, where it has become central to the lives of individuals and the social and economic lives of communities and societies, consumption is part of any social order. In premodern societies, there was typically a closer relationship between the producer and consumer: for instance, the cows of a particular farmer produced milk, some of which he kept for his own use and some of which he may have traded to a neighbor in exchange for part of her crop of soybeans. Production and consumption were closely partnered and reflected an economic system constructed on subsistence production and precapitalist means of exchange, such as barter.

The capitalist economy is built on the relationship between production and consumption, and goods and services are exchanged for money and credit. In contrast to earlier economic forms, the distance between producer and consumer grows as the division of labor becomes more complex and fewer people grow their own food, make their own clothing, or receive education, protection, or other services from within their own family, clan, or other small group.

Classical economics, the product of eighteenth- and nineteenth-century thinkers like Adam Smith (1723–1790) and David Ricardo (1772–1823), theorized capitalist markets and argued for the power of the free market. Classical economics posited the notion of consumer rationality, assuming that consumers of goods and services are rational and spend money in ways that maximize satisfaction from purchases.

Another aspect of consumption theorized in economics is the phenomenon of underconsumption. In underconsumption theory, economic stagnation is fostered by an imbalance between consumer demand and the production of goods. Though underconsumption theory is not central in contemporary economics, it influenced both academic thinking and public policy in the early twentieth century. Beginning around this time, concerns about underconsumption spurred governmental intervention in the economy, particularly public-works spending, which was seen as central to putting disposable income into the hands of American consumers.

Economist John Kenneth Galbraith’s (1908–2006) most widely recognized book, *The Affluent Society* (1958), offers a mid-twentieth-century perspective on economics and consumption. Galbraith proposed a corrective to the conventional theories of economics, which assumed a scarcity of resources. This scarcity, he suggested, justified increased private-sector production and limited government regulation and taxation. However, Galbraith believed the contemporary period on which he focused was characterized by an “affluent society” in which scarcity was not a central concern. As such, he posited that government economic practices were misguided and, in fact, fostered a paradoxical situation of private-sector affluence and public-sector squalor. That is, while private consumption grew, public spending on infrastructure projects, including parks and schools, diminished. Galbraith’s support of public-sector spending has influenced liberal and neoliberal thinkers who followed him. Interestingly, the “affluent society” of which Galbraith wrote and about which he was concerned consumed far less than the consumer society of the late twentieth and early twenty-first centuries.

While Marxist economic theory is commonly associated with concerns about capitalism and production, Karl Marx (1818–1883) did not neglect to recognize the function of consumption in capitalist society. In the *Grundrisse*, he argued that a condition of production in capitalism is “the discovery, creation, and satisfaction of new needs arising from society itself… [Capitalism involves] the developing of a constantly expanding and more comprehensive system of different kinds of labor, different kinds of production, to which a constantly enriched system of needs corresponds” (Marx [1857–1858] 1973, p. 409). While Marx highlighted production as a driving process of industrial capitalism, consumption, whether driven by need (associated with the proletariat) or materialist desires (associated with the bourgeoisie), was a critical partner.

Though the perspectives of classical economists (the “bourgeois economists,” according to Marx) and Marxists differ in many respects, they share a similar perspective on the valuation of consumables (goods and services). The labor theory of value, embraced by classical economists through the middle of the nineteenth century and central to Marxist economic theory, holds that the exchange value of a good or service is derived from the amount of labor (including labor expended on gathering raw materials and producing machinery) required to produce it. Marxist economics, however, adds that the profit derived by capitalist owners of the means of production comes from value added by workers to the consumable good but not paid to them in wages. Capitalist production, thus, is exploitative, as workers produce goods and surplus value is appropriated by the owners.

The labor theory of value has been challenged by social scientists in, among others, the fields of economics and sociology. For instance, the theory of subjective value challenges the notion of intrinsic value that is present in that theory by suggesting that value derives from the power of an object (or service) to meet a need or a desire. The value of a consumable, thus, may derive from variables such as its utility, its scarcity, or its status.
sociologists, nineteenth-century French scholar Gabriel Tarde (1843–1904) was among the first to locate the value of goods in the intensity of consumer desire rather than in the production process. Contemporary sociologists have elaborated the point more fully, highlighting the power of modern marketing in creating desire for goods and services.

Sociologist George Ritzer has written extensively on consumption (and overconsumption) as a sociological artifact of modern society. He argues that modern states are characterized far less by production than by consumption. That is, while in earlier decades, the economies of countries like the United States were focused on production of goods, today many modern states produce few tangible goods (though they continue to produce intangible goods like knowledge and information). Rather, consumption is central to the national economy.

In Enchanting a Disenchanted World, Ritzer suggests that, in understanding the nexus between consumption, capitalism, and modernity, social scientists need to attend to “the new means of consumption,” which he defines as “those things that make it possible for people to acquire goods and services and for the same people to be controlled and exploited as consumers” (1999, p. 57). Examples of the new means of consumption are shopping malls, cruise ships, and Las Vegas–style casinos and resorts. All of these are places that offer the consumer ample buying opportunities but, at the same time, operate as instruments of consumer control, as consumers are convinced to buy what they do not need, to believe that they need what they only want, and to spend beyond their means in order to achieve a sought-after emotional state or status. Even the physical layout of buying venues like supermarkets and malls is constructed with the aim of maximizing spending by fostering impulse buying and forcing consumers to forge a path past a plethora of enticing products or shops before finding the products they need, or even the exit.

In his 1899 book, The Theory of the Leisure Class, iconoclastic economist Thorstein Veblen (1857–1929) argued that in well-off societies spending operates as a means by which individuals establish social position. He coined the term conspicuous consumption, which he suggested was common among the nouveau riche, a class that emerged from the new wealth generated in nineteenth-century America by the second Industrial Revolution. In this period, the rich flaunted their good fortune with the public consumption of luxury items. In this cultural context, Veblen suggested that ostentatious displays of wealth, rather than honest productivity, showed one’s success in society. Of the culture on which he wrote, he commented that “labor comes to be associated in men’s habits of thought with weakness and subjection to a master. It is therefore a mark of inferiority” ([1899] 1994, p. 41). That is, it was participation in consumption rather than participation in production (the labor force) that defined one’s status in society.

French sociologist Pierre Bourdieu (1930–2002) approached the issue of consumption from another angle. He argued in Distinction (1984) that “taste” can be understood as a “field” of contestation. Within this field, “taste” is contested and those with greater resources have the power to define what is in good taste and bad taste. Those in the upper classes, for instance, have the opportunity to both learn and define what is in good taste. By comparison, those in the working class lack the knowledge or the means to exhibit the distinctive (“good”) tastes of the upper class and are disadvantaged by their lack of what Bourdieu calls “cultural capital.” Bourdieu is not suggesting that these categories of culture are objectively real. Rather, he is arguing that taste is a field of play in which those with more power are able to both define and act out “good taste.”

In terms of consumption, the “taste” for burgers or foie gras, commercial action films or foreign movies, and mass-produced beer or fine wine, and the classes we associate with those choices, are socially determined but, like many other social phenomena, take on the appearance of being “natural.” Consequently, argues Bourdieu, taste is a field in which class inequalities are socially produced and reproduced.

One aspect of consumption that is endemic in the United States and other economically advanced countries like Japan and Australia is competitive consumption. In the middle of the twentieth century, Americans, particularly those in the rapidly expanding suburbs of post–World War II America, were concerned with “keeping up with the Joneses.” Economist James Duesenberry (1949), writing in this period, focused on the phenomenon of competitive consumption. The demographic, economic, and technological boom years of the postwar era made acquisition of new consumer goods like dishwashers and color televisions possible, and competitive consumption made their acquisition probable.

Consumption is powerfully influenced by marketing. While this idea is axiomatic today, the power of advertising was not always so widely recognized. In the mid-twentieth century, Vance Packard (1914–1996) illuminated the tactics and techniques of the advertising industry in The Hidden Persuaders (1957). Packard described the marketing of goods through the use of motivational research, subliminal advertising, and other subtle but effective methods of persuasion based in scientific study. Packard linked the imperative to sell to a massive tide of production that followed World War II: marketers recognized the importance of creating an imperative to consume that
could take advantage of the rising tide of affluence (also recognized by Galbraith). Packard took a position against consumer manipulation, arguing that it was a “moral question.”

As Packard recognized, in contemporary America, competitive consumption is heavily driven by the influence of the media. While the reference groups of the past included neighbors who commonly inhabited the same socioeconomic status, the reference groups of the late twentieth and early twenty-first century include those whose earnings may far outpace those of the average consumer. Economist Juliet Schor’s *The Overspent American* (1998) posits that while consumption in early postwar America revolved around keeping up with neighborhood norms, reference groups have “stretched” to include workplace colleagues. The movement of more women into the workplace may have been a catalyst in the transformation of reference groups, as working families may have less time to attend to the habits and acquisitions of neighbors (if they know them at all). Further, reference groups are now also composed of “friends” who inhabit the fantasy worlds of television and films (she gives the example of the popular American television program, *Friends*, on which stylishly dressed twentysomethings inhabited well-appointed apartments in New York City that few of their “real world” contemporaries could afford). Modern efforts to keep up with one’s reference groups are thus more costly and more likely to drive one into debt.

Following close behind Schor’s careful social scientific dissection of modern consumption is Robert H. Frank’s *Luxury Fever* (1999). Frank argues that the “luxury fever” that has gripped modern America is characterized by the pursuit of grander, flashier, more costly goods, ranging from backyard grills (he discovers a top-of-the-line grill that retails for $5,000, not including shipping and handling) to automobiles to megahomes. This pursuit, he notes, is embraced not only by the very rich, but also by consumers with far less disposable income as well, leading to low rates of saving and growing rates of debt. Frank argues that an altered “spending environment,” in which expectations regarding one’s own consumption or even one’s gifts to others, is the product of the profligate spending of those at the top of the economic pyramid and the availability of extravagantly priced products. He elaborates the example of the grill: “The real significance of offerings like the $5,000 Viking-Frontgate Professional Grill … is that their presence makes buying a $1,000 unit seem almost frugal. As more people buy these upmarket grills, the frame of reference that defines what the rest of us consider an acceptable outdoor grill will inevitably continue to shift” (1999, p. 11). To mitigate the effects of the country’s febrile state, Frank prescribes tax exemption for savings and the institution of a progressive consumption tax, arguing, as did Galbraith, that there needs to be greater attention given to public infrastructure spending, which falls by the wayside in a society obsessed with private consumption.

The use of advertising to create a “relationship” between material products and people has been examined by Jean Kilbourne. In *Can’t Buy My Love* (2000), Kilbourne argues that advertisers seek to spur consumption by disseminating the message that products fulfill human needs for things like love, relationships, and respect. Young people are particularly susceptible to messages that promise that product consumption will give them emotional fulfillment. The message has ample opportunities to reach its audience: according to Kilbourne, the average American is exposed to no fewer than 3,000 advertising messages each day.

Social pressures for status, relentless advertising, and easily accessible credit can bring about hyperconsumption. Psychology recognizes hyperconsumption as a disorder, and the term *oniomania* (which comes from the Greek term *onios*, “for sale”) is a label used to designate people obsessed with shopping (conventionally called *shopaholics*). Because the profligate spending of money and the consumption of luxury goods is not only socially acceptable, but often appears desirable, a shopping addiction is less likely to be taken as seriously as other addictions, such as gambling or alcoholism.

Consumption, and arguably even overconsumption, is not only acceptable in the social arena of modern American society, but it is also embraced. Consumer spending accounts for fully two-thirds of all economic activity in the United States. As such, in spite of the substantial debt carried by Americans in contrast to the rest of the developed world, public policy is largely favorable to sustained and even increased consumption. In the wake of the terrorist attacks of September 11, 2001, some political commentators embraced the term *market patriotism* to describe the federal government’s entreaties to continue buying and spending.

Modern market patriotism represents an interesting contrast to the wartime sacrifices asked of previous generations of Americans. For instance, during World War II, Americans were entrusted to carefully control consumption. External controls like rationing were supplemented by appeals to patriotism, including the Consumer’s Victory Pledge signed by millions of American housewives: “As a consumer, in the total defense of democracy, I will … buy carefully. I will take good care of things I have. I will waste nothing.”

Internationally, the United States has a low rate of both national and household savings, far below that of Western European countries, Japan, or China. This reflects, in part, the priority given by different states and
individuals in the global community to savings and consumption, as well as adversity to debt.

While the study and theorization of consumption in the social sciences has been in existence for a long time, it has evoked the greatest interest in the decades of the late twentieth and early twenty-first centuries. The growth in consumption, both nationally and globally, correlates with a rise in studies and publications on consumption, consumerism, overconsumption, and the transformation of modern societies from producers to consumers.

**BIBLIOGRAPHY**

**CONSUMPTION FUNCTION**

The classical economists were concerned with the economic categories of consumption, production, and exchange. One description of the classical Say’s Law is that it states that production and consumption are identical. From the perspective either of underconsumption or over-saving, one category is perceived as a limit of the other. In the hands of John Maynard Keynes, however, consumption became a function, relating aggregate consumption, $C$, mainly to aggregate disposable income, $Y$, defined as income less taxes and transfer payments. This equation has been called the *absolute income hypothesis* (AIH). Like a good gardener, Keynes weeded out many variables that could influence consumption, settling on disposable income as the most important one. Keynes wrote the implicit form of this relation as $C_w = χ(\chi')$. In another context, he held that $C = θ(\chi, \chi')$, where the additional variable $\chi$ represents the state of the news, a term that changes with long-term expectation.

The relation of consumption to income follows a psychological law stating that consumption increases with income but not by the same proportion. This law makes the consumption function a behavioral relationship that can be juxtaposed with data as opposed to a structural or identity equation. A testable linear form of the AIH is obtained by expanding the implicit relationship between consumption and income by the Taylor series, ignoring the nonlinear terms. The intercept, $a$, of the line captures *autonomous consumption*, that is, any consumption that is not induced by income. The slope of the line, $0 < dC/dY = b < 1$, is the *marginal propensity to consume* (MPC)—on average, the amount of an additional dollar that is consumed in a community. The Keynesian model uses the MPC to estimate a multiplier that predicts how a change in investment will boost GDP. By examining data for the United States, Keynes estimated the MPC to be between 60 and 70 percent.

The Keynesian consumption function sparked a new research program. For example, significant works by Milton Friedman on the permanent income hypothesis (PIH) and Franco Modigliani on the life cycle hypothesis (LCH) were in large part the catalysts for their Nobel Prizes in 1976 and 1985, respectively. The PIH-LCH models reconciled anomalies in the prediction of the AIH during the post–World War II period. The major anomaly was that the average propensity to consume was over 90 percent, whereas short-run MPC was between 60 and 70 percent. Modigliani and James Duesenberry reconciled the differences by postulating a previous peak income in the consumption function. Whereas Modigliani’s work evolved into his LCH hypothesis, Duesenberry's relative income hypothesis (RIH) remained an example of external

**CONSUMPTION, CONSPICUOUS**

**SEE** Conspicuous Consumption.

Daina S. Eglitis
effects on consumption in line with Veblenesque norms; defined in terms such as emulation, convention, and molding, it holds that a person’s consumption depends on the level and types of other people’s consumption. RIH also holds that consumers would want to maintain a consumption pattern established by the highest income they had previously received. During a downswing phase of a business cycle, consumers experience a reduction in income but are hesitant to adjust their spending behavior away from what they had established during a previous peak period. Consumers prefer to draw down their savings or borrow in order to maintain their previous peak consumption. Only when they recover their previous peak level income will their consumption behavior change. The change is an unusual one, a sort of quantum leap or “ratchet” upward, perhaps due to pent-up demand during the downswing. This upward effect amounts to a reconciliation of the short- and long-run MPCs.

Robert Frank expanded and articulated the RIH paradigm in relation to the question of how current relative consumption will dominate future relative consumption. Parents who prefer to buy a house in a good school district now may be negatively affecting their future consumption after retirement. Conversely, spending now on a suit for a job interview may have a positive impact on future income. The experience of low relative consumption now may also set expectations for a low relative consumption in the future. Juliet Schor’s “new consumerism” is also based on lifestyles and norms, and posits that consumers elevate their consumption to unsustainable levels that lead to mounting debts and bankruptcies, as well as longer working hours.

The LCH-PIH hypotheses advance consumption theory by introducing wealth or assets as well as income into the consumption function. In this scenario, consumers draw on their lifetime income and assets to smooth their consumption expenditures over their life cycle. We can speak of permanent income—changes in which have more significant effects on consumption than temporary or transitory changes in income. The two hypotheses have one major difference: Friedman made the income stream infinite, whereas Modigliani made the income stream finite. For instance, Modigliani estimated the consumption function as: \[ C = 0.766Y + 0.073A. \] Here the short run MPC is 0.77, and if assets, \( A \), are approximately five times income, while labor income is approximately 80 percent of income, then a long-run MPC of 0.98 = 0.8(0.766Y) + 5(0.073Y) is reached. Essentially, the presence of wealth in the AIH causes it to drift upward.

With the introduction of these hypotheses, the stage was set for a paradigmatic shift in the consumption function. Friedman estimated the PIH through a distributed lag model, which John Muth showed to be optimal under rational expectation assumptions. Because Friedman left the definition of income vague, Muth proceeded to measure permanent income by an exponentially moving average equal to the conditional expected value under rational expectations. Robert Lucas expanded the rational expectations concept by shifting the meaning of the consumption function from one relating consumption and income, to one relating permanent income and observed income. Robert Hall rescued the consumption function from that line of attack by postulating that only surprising events could be responsible for unanticipated results. The model he specified maximizes the expected value of lifetime utility subject to an unchanging real interest rate. He presumed that consumers would make the ratios of marginal utilities for present and future consumption equal to the ratio of their prices. Hall tested his consumption function in the form \[ C_{t+1} = \lambda Y + error, \] a random walk model. Clive Granger referred to the consumption theory as “manna from heaven to macro-econometricians. It was easily stated and understood, and appears to be easy to test” (Granger 1999, pp. 42–43). In practical parlance, consumers will tend to adjust their individual consumption so that it will not differ from an expected level. This fact reinforces the underlying principle that consumers tend to smooth out spending over time, and that this practice relates to some uncertainty about income. Hall’s model rendered the lagged income effect insignificant on consumption. If consumers have a quadratic utility function, then they will want to consume at the level where their future income will equal its mean value.

Marjorie Flavin, a student of Hall’s, made two findings that furthered the development of the consumption function. One finding is that future consumption is sensitive to the previous level of consumption and can show a strong variation. Another finding is that the surprise element does not cause much variation in future consumption. John Campbell and Gregory Mankiw had the idea of combining these two findings in a convex way. This means that a proportion of the variation will be captured. Following Hall’s model, the surprise element varies by a certain proportion and thus income will explain the less than proportional expected consumption. The combination of Hall’s model with the LCH consumption equation resulted in a simple test of a change in consumption based on a change in disposable income. Since Hall’s work, research on the consumption function has been escalating.

CONTACT HYPOTHESIS

The contact hypothesis holds that contact between the members of different groups tends to reduce whatever negative intergroup attitudes may exist. The greater the contact, the less the antipathy. This idea is a crucial part of the broader theory that ethnic antagonism (as shown in prejudice, discrimination, and stereotyping) has psychological causes (misperception and projection) rather than social or economic causes (conflicts of interest).

The hypothesis can be traced far into the past, but it was given its contemporary form by Gordon W. Allport in The Nature of Prejudice (1954). He listed a large number of variables that could modify the effects of quantitative differences in contact. At the beginning of the twenty-first century, these are usually reduced to three or four key conditions for intergroup contact to reduce prejudice: equal status between the individuals having contact, common goals and cooperative interdependence in reaching them, and the support of social and institutional authorities for equal-status contact. In this qualified form, the hypothesis has figured prominently in discussions of racial desegregation in the United States.

As a conjecture about the effects of personal contact on individual attitudes, the hypothesis is easy to test, and the results of several hundred published studies are relatively easy to summarize. Regardless of whether the supposedly necessary conditions for favorable outcomes have been satisfied, greater contact is almost always associated, more or less strongly, with such outcomes (less prejudice and greater acceptance).

Difficulties arise when these results are extended from individuals to groups. It seems obvious that if an increase in contact improves the attitudes of individuals, it must do the same for the relations between groups, even if only a little. Nevertheless, both casual observation and careful studies suggest that there can be strong positive correlations at the group level between personal contact and negative attitudes. Comparisons of American states or counties on black-white contact and racial prejudice and discrimination provide the clearest illustrations of this relationship.

Allport’s qualifications were meant to deal with this problem. If contact reduces prejudice, how could there be more of it in the South (at least in the 1950s) than in the
Contango

North or West? Under favorable conditions, he reasoned, more contact means less prejudice, but under unfavorable conditions (such as in the South), contact increases prejudice. As noted above, research at the individual level has not supported this view. Contact generally reduces prejudice, regardless of the situation.

An alternative approach starts from the assumption that different processes can prevail at the individual and group levels. As H. D. Forbes has shown in Ethnic Conflict (1997), the apparently contradictory correlations can be explained by a theory that distinguishes levels of analysis rather than situations or conditions of contact. When only individuals are compared, the standard correlation appears, but when all the individuals in an area are averaged and compared with all the individuals in another area of greater or less contact, generally speaking, the relationship is reversed. This approach is consistent with the contact hypothesis as a generalization about individuals, but it deprives it of much of its broader significance for social theory and public policy. It is not surprising, therefore, that recent reviews of the relevant literature still show a virtually undiminished allegiance to Allport's classic formulation, despite its empirical shortcomings.

CONTANGO

The term contango refers to a case where the futures price exceeds the expected future spot price of the underlying commodity. Futures prices are the prices of futures contracts for the commodity. Expected future spot prices are the prices of the commodity in the spot market that are expected to prevail in the future. Consequently, the futures price will fall to the spot price before the contract maturity date. This scenario is established under the expectation hypothesis, which suggests that futures prices are determined by market expectations. The opposite pattern, called backwardation, occurs when the futures price falls short of the expected future spot price. In this instance, the future rises toward the expected future spot price.

The relationship between the futures price and the expected future spot price depends on the net hedging position. Traders in the futures market can be classified into hedgers and speculators. Hedgers have a preexisting risk associated with a commodity and enter the market to reduce that risk, while speculators trade in the hope of profit. Hedgers, taken as a group, may be either long (i.e., they buy more than they sell) or short (i.e., they sell more than they buy). If hedgers are net short, speculators must be net long so that the market reaches equilibrium. To entice speculators, the futures price must be less than the expected future spot price and rise over time; hence the futures market exhibits backwardation. Conversely, if hedgers are net long, speculators must be net short. The futures price must lie above expected future spot price and fall over time to compensate the speculators, leading to contango.

An alternative definition relies upon the cost-of-carry arbitrage argument. Specifically, contango is referred to the case where the futures price exceeds the spot price. Moreover, the price of the futures contract with a distant maturity exceeds that with a nearby maturity. Conversely, backwardation refers to the situation in which futures price is less than the spot price; and the further away the contract maturity is, the smaller the futures price is.

In an efficient, frictionless market, to preclude arbitrage profits futures price must equal the spot price compounded at the risk-free rate, plus the cost of carry, which is future value of the storage costs minus the benefits (also called convenience yield) over the life of the contract. Because the cost of carry can be either positive or negative (depending upon the magnitude of the benefits), the futures price can be greater or less than the spot price. In reality, the principles of the cost-of-carry place at best a no-arbitrage bound on the futures prices. Within the bound, expectations are critical in establishing futures prices.

Generally, buyers prefer to receive the commodities right away, whereas sellers need time to produce. Consequently, the spot price tends to be larger than the futures price and backwardation is normally expected. Empirical investigations suggest that backwardation prevails in agricultural commodity and energy markets and contango occurs in currency markets. Nonetheless, the market may revert from backwardation to contango and vice versa from time to time. The financial loss of Metallgesellschaft Refining and Marketing (MGRM), Inc. in 1993 was partially due to contango that prevailed in unleaded gasoline and heating oil futures markets.

CONTEMPT

Contempt is a universal human emotion. While there are minor differences among emotion theorists and researchers, there is general consensus about the features of contempt. First, contempt is an interpersonal emotion; that is, it occurs in social situations, when people are interacting with or observing others. Second, it involves a negative evaluation of another person's behavior, which in and of itself signals one's sense of self-importance relative to others. Third, it involves feelings of moral superiority over the other person—that is, the feeling that the person is lower or unworthy. Fourth, it involves positive feelings about oneself.

Contempt is often confused with other emotions, particularly anger and disgust. Research, however, has demonstrated that contempt has its own unique facial expression—a unilateral curl and/or tightening of the lip corner, but only on one side of the face. This expression often occurs with a slight head raise and tilt, to give the appearance that one is “looking down one’s nose” at the other, and/or turning away at the same time. Studies have also shown that individuals may not use the word “contempt” very frequently, and are generally not able to give a definition of it that includes the various components described above. Yet, most individuals certainly understand the situations in which it is elicited, and can reliably match the universal facial expression of contempt with those situations.

One of the functions of contempt is to create or maintain a social hierarchy. Being contemptuous of another person signifies one’s judgment of the other person’s social rank relative to one’s own. Contempt prepares one to establish one’s dominance in the hierarchy. Expressing that emotion through one’s facial expressions, demeanor, or behaviors sends signals to others of one’s intentions to establish hierarchical superiority. Recipients of those signals may either acquiesce, thereby conferring status to the contemptuous person, or they may prepare themselves for dominance struggles, which may set the stage for a new hierarchy.

Another function of the emotion of contempt is to validate one’s self-worth. Although contempt is normally considered by many people to be a negative emotion, in reality contempt involves positive feelings about one’s own self-worth. Thus, contempt may feel good, even though the situation that elicits it may be viewed as a negative one. Indeed, it may be important for all humans to validate their feelings of self-worth in this manner from time to time.

Although there is a class of emotions that humans share with other animals, there is some evidence to suggest that contempt may be an emotion that is unique to humans. This may be because contempt involves evaluations of one’s moral superiority over others. Complex cognitive abilities are required in order for this evaluation to occur, particularly the ability to know that other people are intentional agents (i.e., they do things because they are motivated to do so), and the ability to evaluate the actions of others according to agreed-upon cultural norms and mores. These cognitive abilities exist in humans, but not other animals.

Contempt has unique interpersonal effects. Because contempt signals one’s moral superiority over another person, it can lead to destructive outcomes in some social relationships. For example, research on distressed married couples has shown that if contempt is expressed by one member of the couple, especially the husband, when discussing areas of major disagreement, the couple is more likely to be in trouble, report greater marital dissatisfaction, report greater periods of marital separation, and experience greater health problems.

Contempt also has important intergroup effects. It serves to differentiate ingroups from outgroups, and helps individuals to depersonalize others. The depersonalization of others makes it easier for collective violence to occur, as it gives people permission to do unto others what they would normally be restrained from doing. Political leaders in the midst of war often describe the enemy with contempt-related words and phrases, suggesting that the enemy is “beneath” members of their culture, and somehow “unworthy.” These feelings may be necessary to provoke humans to engage in collective violence against others. Thus, an analysis of contempt may play a major role in understanding intergroup conflict.

CONTRACEPTION

The Fourth World Conference on Women, held in Beijing in 1995, reinforced that all human beings have the right to “decide freely and responsibly the number and spacing of their children and to have the information and means to do so, and the right to attain the highest standard of sexual and reproductive health” (para. 95). A discussion of contraception provides us with an understanding of how access to comprehensive family planning services can improve the lives of women, men, and children around the world.

Contraception, or birth control, is the deliberate prevention of conception by hormones, devices, surgery, or avoiding intercourse during a woman’s fertile time of the month. Family planning is the intentional decision on the number and spacing of children a couple will bear.

According to the World Health Organization (WHO), there are approximately 123 million women, mostly in developing countries, who are not using contraception. Some of the reasons include poor access to comprehensive services, inadequate information, male partner disapproval, and fears about side effects and safety. Religious beliefs and public policies also play an important role in methods that are available to couples in both developing and developed nations.

Religious beliefs and public policies also play an important role in methods that are available to couples in both developing and developed nations.

RELIGION AND PUBLIC POLICY

Humans have been using birth control from the earliest times. Ancient Islamic texts, Jewish writings, and Hindu sacred scriptures all mentioned that herbs could be used as temporary contraceptives. Modern religious stances vary according to their definition of the place of sex within marriage; for example, the Catholic Church prohibits any artificial means of birth control because it believes that the sole purpose of sexual intercourse is procreation. Some Christian fundamentalists, Evangelicals, and Anglicans share this view. Orthodox Judaism permits female contraceptives only for health reasons; while Conservative and Reform views leave the decision to the married couple, as does Christianity’s Eastern Orthodox Church. The Islamic faith has wide variations on attitudes toward birth control, but despite this, procreation is emphasized as religious duty. There is no prohibition to birth control in Hinduism. As noted by Kathleen O’Grady in her 1999 article “Contraception and Religion, a Short History,” the two common concerns of all major religions are fear of illicit sex and immorality, and destruction of the family. Particularly among non-Western religions, the worry is that liberal family planning policies could encourage Western modes of living, not only destroying the family, but family values as well. Some Christian fundamentalists in the United States agree with this stance. On the other hand, women’s rights activists argue that prohibiting birth control is a fundamental way to control women and keep them dependent on men.

National and international public policy also plays a role with respect to sponsoring or funding reproductive health services, and policies are modified with changes in national leadership. In the United States, for example, President George W. Bush instituted a global “gag” rule regarding abortion in 2001. This means that foreign agencies, such as the WHO, no longer receive funding if they counsel women about abortion, consequently affecting family planning programs as well.

HISTORY OF CONTRACEPTION AND CURRENT METHODS

Despite religious decrees about contraception, there are many references that document three major methods that go as far back as ancient Greece: the use of herbal remedies as abortifacients, coitus interruptus (withdrawal of the penis from the vagina before ejaculation, hereafter referred to as withdrawal), and abstinence. Condoms were described as protection against sexually transmitted infections (STIs) in the early sixteenth century. Rubber condoms became available in the United States in the nineteenth century along with cervical caps, diaphragms, metal pessaries, and male and female sterilization. The birth control pill revolutionized contraception with its
debut in 1959. There have been many advances in hormonal and non-hormonal contraceptive technologies for women in the last thirty years. Although research is being conducted on systemic methods for men, condoms, withdrawal, and sterilization remain the only contraceptive options for them. See Table 1 for current methods.

Male latex condoms, when used reliably and properly, are highly effective in preventing STIs and the human immunodeficiency virus (HIV). The female condom is the only female method that is effective in preventing pregnancy and STIs/HIV. People at risk for sexually transmitted infections (STIs) and/or HIV may be afforded dual protection against STI/HIV and pregnancy by using either male or female condoms. Using condoms and another form of birth control are even more effective measures of contraception.

**INTERNATIONAL STRATEGIES**

The World Health Organization has taken the lead on providing resources for international family planning since its inception in 1948. Paul Van Look, director of the WHO Department of Reproductive Health and Research, has stated that sexual and reproductive health are concerns for everyone at all stages of life and are fundamental to the economic and social development of nations, but also mirror basic inequalities such as wealth and gender. Women have been particularly harmed by lack of access to reproductive health services; research documents that the ability to space pregnancies impacts a woman's health and quality of life, as well as the health of her children. Family planning programs can also improve the economic and social situation of women's lives.

CONUNDRUM
Conundrums are problems of several types. They may be riddles with a pun for an answer. They may be puzzling problems that are complicated with intricate features. And they may be presented in the fashion of a rhetorical question, but with only conjecture for an answer.

Conundrums create paralyzing paradoxes or dilemmas. Psychologically, they are similar to approach-approach conflicts, such as a conflict known as Buridan’s ass, which was posed by fourteenth-century philosopher Jean Buridan. An ass forced to choose between two equally luscious piles of hay that are equidistant starves to death. This is similar to the Malthusian dilemma, which states that helping the poor (humanitarian) may be increasing starvation (inhuman) when food supplies grow arithmetically while population grows geometrically.

The word conundrum is often used cynically to describe a puzzle that will probably never be solved because of a lack of data. The word conundrum is also used to describe a paradoxically difficult problem, such as the problem faced by economists in the second half of the twentieth century of how to achieve full employment without inflation.

Conundrums are puzzles that call for lateral thinking. In traditional logic puzzles an array chart can be used to sift through the possibilities in a systematic way. In lateral thinking, puzzles are not solved by a linear method but more in the fashion of brainstorming. Every possible piece of the riddle is identified and all solutions are posed as hypotheses with the mostly likely tested first.

Unlike traditional logic puzzles, conundrums use riddles with plays on words that seek to mystify or mislead, or a conundrum may pose a fanciful question that is answered with a pun. For example, the chicken conundrum: which came first, the chicken or the egg?

Conundrums pose problems that seem to defy solution because the problem is in the form of a dilemma wrapped in a riddle. Businesses, voluntary organizations, and other human enterprises often face problems that seem to be insolvable riddles. Should criminal wrongdoing be reported so that justice can be done, but also damage the institution by the exposure? What should be the treatment dilemmas for patients with complicated medical conditions when action “A” kills and inaction kills.

The structure of scientific revolutions has been one in which anomalies do not match the prevailing model. Eventually the anomalies defy the orthodox theory and create a conundrum. How is it possible for things to be both this and not this? What illumination travels like a wave and like a packet, but cannot be simultaneously both? Daylight dancing and waving until it delivers its quantum packets.

In the conundrums faced by political and economic decision-makers, the “play” aspect of conundrums suggests that game theories may help with solutions. Presumptions are abandoned and solutions are sought freely.

CONVERGENCE THEORY

As early as 1848 in the *Communist Manifesto* Karl Marx contended that human civilization developed in stages from pastoral to communist harmony, driven by an ineluctable historical dialectic. Capitalism from his perspective was an internally contradictory phase destined to be destroyed by a proletarian revolution ushering in a transitory socialist epoch before arriving at the end of history. Private property for Marx was the original sin that caused humanity’s expulsion from the Garden of Eden. It provided a legal basis for concentrating community wealth in a few powerful hands, the emergence of market exploitation, the class struggle, and in Marx’s view communism’s inevitable triumph. Economies featuring private ownership of the means of production and markets consequently were intrinsically inferior (exploitative, inegalitarian, and unjust), and could not be blended with, or supersede, communism.

Vladimir Lenin and his Bolshevik successors accepted these concepts. Markets of various sorts could and did exist according to Soviet ideologists during the socialist interlude following the destruction of capitalism, but not in the final stage of historical dialectic.

However some Western liberals, like Francis Fukuyama, used similar historicist logic to reach the opposite conclusion. They argued that private ownership of the means of production was essential for individual utility maximization. Original sin for them was any power including the state that prevented people from achieving consumer sovereignty in the private sector, and democratic sovereignty over the provision of public goods. People’s appreciation for the virtues of democratic free enterprise was weak before the eighteenth-century Scottish economist Adam Smith, but Fukuyama claimed that momentum is building and democratic capitalism will be the end of history (equated by many with globalization). As in the Marxist concept there is no room for blended solutions. Proletarian dictatorial democracy, and private propertyless capitalism are oxymorons. Capitalism and communism cannot converge, and socialism cannot supersede, communism.

Consequently, Nobel Laureate Jan Tinbergen’s assertion in the late 1950s and early 1960s that Soviet and Western market systems were immutably converging provoked a heated reaction from Marxists, democratic free enterprisers, and those who preferred various third ways. True believers of both Marxist and Fukuyamaist persuasions predictably rejected convergence out of hand, while those who supported cold war reconciliation without committing themselves to communism or democratic free enterprise welcomed Tinbergen’s theory. Social democrats were especially pleased because Tinbergen’s vision prefigured the eventual triumph of the emerging European Union. The end of history would blend democracy, private ownership of the means of production, individual utility seeking, and markets with planning and state-supervised social justice. Of course, as the economist Ota Sik pointed out, the blending could go the other way, substituting authoritarianism for democracy, and Stalinist injustice for the welfare state, but supporters were confident that reason would preclude negative outcomes in the long run.

It is possible to dismiss Tinbergen’s musing as partisan wishful thinking. Rationalist historicism is not physics. But convergence theory was predicated on a legitimate insight. Robert Dorfman, Paul Samuelson, and Robert Solow among others had used linear programming to demonstrate that there was a perfect duality between computopic (ideal, but unachievable computer based simulations of optimal market equilibria) planning and competitive market outcomes where planners’ and consumers’ preferences were identical. It followed that the gulf perceived by Marxist and democratic free enterprise theorists between communism and capitalism was only a matter of efficiency—the practical effectiveness of markets and plans—not a matter of technology or ideals. In an imperfect world where markets are sometimes exploitive and plans inefficient, neither communism nor perfect democratic free enterprise is attainable, and once this is appreciated, Tinbergen claimed democratic socialism would gradually become universally accepted as the pragmatic second best.

This conjecture—although seemingly supported in the 1960s by “converging” growth rates, institutional adaptation including European indicative planning, and the Soviets’ partial introduction of profit-based managerial bonus incentives (Liberman reform)—however was not consistent with all the facts. The Soviets had not rescinded their criminalization of private ownership of the means of production, business, and entrepreneurship (Marxist national ownership of the means of production and state monopoly of business) as Tinbergen’s theory required. European social democracy did not rely on physical systems management. And the ideal mixing of optimal planning and perfect markets never materialized.

Nor have subsequent developments been more confirming. Postcommunist reassessments of Soviet economic growth have shown that East-West growth convergence was an illusion. Indicative planning, central to Tinbergen’s theory, has been largely abandoned by states, and the USSR never relinquished physical systems management, despite the economist John Kenneth Galbraith’s predictions to the contrary. And most tellingly of all, the Soviet Union collapsed and Eastern Europe rejected communism in the early 1990s instead of converging. North Korea and...
Laos have stayed the communist course rather than blend. And post-Soviet Russia and China failed to transition to social democracy despite adopting mixed economic arrangements. Other nations are resisting transition, and liberalization is altering social democracy as Tinbergen understood it. The evidence suggests that while rationalist historicism has widespread popular appeal convergence—like all end-of-history hypotheses—has little predictive value, a point lost on many theorists who continue to try to show using dubious official aggregate growth trends that alien systems are fundamentally alike, or are converging to a common high economic frontier.

CONVERGENT VALIDITY
SEE Validity, Statistical.
The basic idea behind CA is that conversation is orderly in its details, that it is through detailed order that conversation has meaning, and that conversational details manifest themselves in specifiable forms. These include turn types, turn transitions, membership categorization devices, and forms of indexicality (words and sentence fragments with multiple possible meanings) that require constant attention to orderly production and ensure that participants maintain interactional reciprocity. The need to display attention to these preference orders solves the problem of how any speaker can know whether or not the listener has understood what was said and provides a way of explaining how the meaning of words are disambiguated in particular situations of use. It also introduces an inevitable moral dimension to interaction.

According to Sacks, the ability of any speaker to take a recognizably intelligible turn next, after a prior turn (given a sufficient degree of indexicality in the talk), displays understanding. Thus, speaking in indexical fragments, which linguistically would appear to be a problem, is a highly efficient device for ensuring mutual intelligibility. It ensures that all participants who take turns are fulfilling their listening and hearing requirements and either understand what has been said, or display their lack of understanding in their next turn. Even speaking last demonstrates attention to a long sequence of turns.

CA referred to this phenomenon as “recipient design,” a process in which each speaker, at each next conversational point, designs a turn at talk with the “other,” the recipient, and the last turn in the conversational sequence in view. The recipient, in turn, hears the talk as oriented specifically toward the current sequential ordering of turns, in the current interactional situation.

All conversational preference orders have direct implications for what can be done next in conversation and how immediately prior utterances can be heard to follow from those before. The general position on the problem of indexicality and social order was articulated by Garfinkel and Sacks in “On Formal Structures of Practical Actions” (1970). The importance of conversational sequencing was articulated in 1948 by Garfinkel (2006). Each interaction is a context for what occurs within it, but a context that is in essential ways independent of broader social contexts, except as a “context of accountability.” This “context-free/context-sensitive” character of recipient design, as Sacks and Schegloff called it, is made possible by a move away from the symbolic content of words, to a focus on the enacted positioning of words in spoken sequences of turns.

Turntaking preferences are sensitive to both the sequential character of conversation, and the presentational selves of participants. There are thus elements of both “within-turn” and “between-turn” preference orders that transcend particular conversations. This view of the “context free/context sensitive” character of particular conversations is quite distinct from the more popular, but problematic idea of context as shared biographies, or shared cultural values—the view that characterizes conventional, postmodern, and interpretive sociologies.

Many social theorists have made superficially similar arguments, but none have been able to ground them in an approach to language and interactional practice that could provide for either the details of situated meaning or the moral commitments required. The tendency is to continue thinking in terms of associations (Bruno Latour) and the content of dialogue (Jürgen Habermas), instead of focusing on the situated and detailed sequential character of conversation.

The CA approach promises to explain not only how the mutual intelligibility of words is achieved in areas of practical, technical, and instrumental importance, but also why persons from different social “categories,” including those associated with race, gender, culture and disability, experience conversational difficulties. “Membership-categorization” devices and small differences in the details of preference orders promise to unlock the key to many social issues.

The study of preference orders in medical settings has already made a significant contribution to studies of doctor-patient interaction, the study of diseases such as diabetes, and the delivery of what Maynard calls “bad news” in medical and other settings (see studies by Maynard, Pomerantz, Heritage, Halkowski, Clayman, Heath, and Mondada). Similar advances have occurred in the study of human-machine interaction (see studies by Heath, Greatbatch, Mondada, Orr, Hindmarsh, Button, Vinkhuyzen, and Whalen) Internet financial exchanges (Knorr-Cetina), business and technology (see studies by Heath, Vinkhuyzen, Boden, Hindmarsh, and Whalen), and technology and policing (see studies by Meehan, Zimmerman and Whalen, and Maynard). Paul Ten Have set up and maintained a CA Web site starting in the 1980s. There is also an ASA Section for Ethnomethodology and Conversation Analysis; an International Institute for Ethnomethodology and Conversational Analysis associated with Boston University and Manchester Metropolitan University; a work, Interaction and Technology Research Group at King’s College London; and an Institute for Workplace Studies associated with faculty at Bentley College, all devoted equally to CA and ethnomethodology (EM).

With CA and EM, the sociological promise is transformed and rejuvenated. Instead of beginning with individuals, and aggregating their attachment to beliefs and...
symbols across large numbers of persons to reveal alleged underlying causal effects of institutions, CA and EM assume that institutions, where they exert an influence on daily life, will, and indeed must, manifest themselves in the sequential details of interaction. What is necessary is to discover those orders, which, when they are violated, render interaction unintelligible, and how such troubles are repaired. In this way the underlying social facts of social orders can be laid bare.

CA does not study a micro order that accompanies a macro order, as some have claimed. Rather, the idea is that all social orders, including politics, race, class, inequality, and justice, must be enacted at the level of conversational and interactional orders, or they would cease to exist. This is not a reductionist argument, as many believe, and does not begin with the individual. The point of refusing to begin with so-called macro structures is not to deny that constraints exist beyond local orders of conversation. Rather, the argument is that the result of treating “macro” structures as independent entities that manifest themselves in the beliefs and values of individuals is to render invisible the effects of such constraints on persons engaged in producing living social orders.

Situated interaction itself, in situations of particular sorts, places requirements on what participants can and must do, and those must be understood by researchers. It is these situated requirements, in fact, that are the stuff and substance of EM and CA. Each situation requires persons to mobilize a set of resources in ways that will be recognizable to others in that situation. These orders are a basic feature of modernity—situations not grounded in shared belief—and their study offers a foundation for the discussion of politics and morality in a modern global context.

Anne Warfield Rawls

COOK, JAMES 1728–1779

James Cook became one of the most famous eighteenth-century British navigators and cartographers. Cook was born into a farming family in north Yorkshire. At age thirteen, Cook's father sent him to apprentice with a local shopkeeper. According to mythology, the young Cook spent most of his time staring out the shop's window at the sea. Whether true or not, the shopkeeper declared Cook ill-suited for that profession. He then became an apprentice in the merchant navy, where he learned navigation and astronomy.

As Britain prepared for war with France, Cook joined the Royal Navy in 1755. During the French and Indian War (1755–1763), the young sailor earned a reputation for his accuracy in cartography. In 1759 Cook surveyed and piloted the British fleet through the St. Lawrence River. During the critical battle over Quebec, the Plains of Abraham, the British commander depended on Cook's maps of the St. Lawrence River to devise his winning strategy.

After the war, Cook embarked on an often dangerous mission to map the jagged coastline of Newfoundland. The treacherous and unknown elements of the Newfoundland coast challenged both Cook's seamanship and charting abilities. By 1767, however, he produced a remarkably accurate map of Britain's newly acquired territory. The Newfoundland charting mission brought Cook to the attention of the Royal Admiralty and the Royal Society for the Improvement of Natural Society.

Between 1768 and 1779, Cook conducted three extensive navigation missions through the Pacific Ocean. The British Admiralty expected the expedition to locate and chart the Australian continent. During his first voyage, Cook, commanding the HMS Endeavor, became the
Cooperation

second known European to land on New Zealand and the first European to explore and chart Australia’s eastern coastline. A group of Aborigine inhabitants attempted to prevent the intruders from landing as the British vessel dropped anchor in Botany Bay. The British sailors used their guns to force the warriors to retreat, making the first encounter between Europeans and Aborigines a hostile one. As Cook sailed further north along the coast, his ship struck the Great Barrier Reef. His crew needed to spend several weeks repairing the vessel. During this time, Cook established fairly cordial relations with the surrounding indigenous groups. After publishing the journals from his first journey (1768–1771), he gained a certain level of notoriety in Britain.

Only two months after his first mission, Cook departed for his second major journey (1772–1775). He piloted the HMS Resolution and circumnavigated the globe along a southern latitude. He charted South Georgia, Easter Island, Vanuatu, and numerous other islands. This journey resulted in more tense encounters with indigenous populations. Some of Cook’s men lost their lives in skirmishes with New Zealand’s Maori populations.

During Cook’s last major expedition (1776–1779), he became the first European to visit the Hawaiian Islands. Cook initially named these Pacific islands the Sandwich Islands after his benefactor, the fourth Earl of Sandwich. The Polynesian inhabitants, who happened to be celebrating an important religious ritual, greeted Cook with great reverence during their first encounter. This goodwill, however, did not last. On Cook’s second trip to Hawaii, his men engaged in a bloody battle after the local population stole one of their smaller boats. During the conflict, the inhabitants stabbed and bludgeoned Cook to death.

Cook’s name still has great currency and one can find many monuments in his honor throughout the globe. He also has several universities and other educational facilities named in his honor.

COOPERATION

Cooperation, wrote Karl Marx (1818–1883), occurs “when numerous workers work together side by side in accordance with a plan, whether in the same process, or in different but connected processes” ([1867] 1977, p. 443). What he describes in this passage about the economic realm is the superficial appearance of cooperation rather than the diverse cultural practices, social relations, and modes of production that underwrite it. He then proceeds to point out the diversity of those forms. Marx was acutely aware that people cooperate for other reasons besides the production of goods or the satisfaction of needs defined narrowly as economic rather than more broadly as intellectual development, aesthetic stimulation, play, or the fulfillment of social functions, to name only a few.

Authors with quite different ontological standpoints have written about cooperation. On the one hand, early theorists of liberalism, such as Thomas Hobbes (1588–1679) or John Locke (1632–1704), who presupposed that individuals existed before society, sought to explain the conditions under which innately competitive, natural men came together to constitute a society in order to pursue collectively life, liberty, and property. For intellectual descendants, like neoliberal policymakers or sociobiologists, the problem is to explain the development of cooperative (altruistic) behavior; their solution resides in exchange broadly written—the market for policymakers, the transmission of genes for sociobiologists. On the other hand, critics of liberal social theory—Georg F. W. Hegel (1770–1831), for example—presupposed the existence of sociality from the beginnings of humankind and sought to explain how the actual conditions of human existence have been transformed by the collective social activity of human beings. The problem from this perspective is to account for competition in a world that exhibits enormous amounts of cooperative activity.

Recent discussions of cooperation may be further obscured by six epistemological tendencies that are frequently encountered either explicitly or implicitly: (1) a philosophical reductionism which postulates that explanations framed in terms of lower-order molecular, neurobiological, or psychological structures (e.g., a universal human nature) are preferable to those couched in terms of emergent social and cultural phenomena; (2) a denial of sociohistorical change which postulates, for example, that the structures of meaning characteristic of the Roman Republic have persisted unchanged for millennia and are effectively the same ones that exist in the West today; (3) an assertion that cultural identities and logics of difference are forged largely in the unequal power relations and one-way discourse between colonizer and colonized; (4) a largely unexamined assumption that earlier writers in the anthropological tradition did not understand what they
saw or were told, especially when their accounts differ from the social relations that exist in the same region today; (5) a related assumption that, since people find it difficult to think outside the analytical categories of their own intellectual tradition, it is also difficult for them to understand other intellectual or cultural traditions; and (6) a belief that all forms of cooperation are structurally equivalent to those of Western capitalism and hence can be adequately explained in terms of capitalist models. Such epistemological presumptions need to be examined carefully and justified, especially as they underpin discussions of cooperation.

Cooperation manifests itself in diverse ways and is buttressed by a variety of social forms. Let us consider briefly a few examples: (1) the factory described by Marx where a number of workers put into motion more or less elaborate technical divisions of labor to produce commodities for the owner; (2) the long-discussed and carefully planned hunting expeditions of San men of southern Africa, which are complete with details of how and with whom meat will be shared; (3) the annual, week-long fiestas in highland Andean communities that are constructed around cleaning and repairing local irrigation canals and terraces; (4) the rotating credit associations, pooling of resources, and almost continuous swapping of goods to defray the costs of everyday needs in rural settlements along the U.S.-Mexico border; (5) the Maasai women in eastern Africa who prepare food and drink for the age-set initiation ceremonies of their sons and husbands; and (6) the improvisations of jazz musicians in a jam session. Cooperation does not always mean that the interpersonal and social relations of the participants are harmonious; frequently, they are tense, and individuals may be cajoled or feel compelled to participate. Nevertheless, not cooperating may be unavoidable, unadvisable, or even unthinkable.

**COOPERATIVES**

People in every society and throughout history have participated in cooperative arrangements, including joint decision-making; economic, social, and political collaboration; and collective ownership. There are a multitude of examples in every culture and era, starting with the early African nations, Aboriginal societies in Australia, the First Nations in the Americas, and Indian and Southeast Asian civilizations. Many grassroots cooperatives have operated throughout the world over the past two to three centuries. In modern history we refer to cooperatives as enterprises, usually businesses (for-profit and not-for-profit) that are jointly owned and governed by a collection of people for a specific economic and/or social purpose. Although these are found throughout the world, the most famous cooperatives have been located in Great Britain, Japan, Italy, Spain, and Canada. In 1752 Benjamin Franklin was one of the founders of the first formal cooperative recorded in history, a fire insurance company in the United States.

Cooperatives are companies owned by the people who use their services, those who formed the company for a particular purpose and are the members of the enterprise, i.e., member-owners. Cooperatives are created to satisfy a need—to provide a quality good or service at an affordable price (that the market is not adequately providing); or to create an economic structure to engage in needed production or facilitate more equal distribution to compensate for a market failure. The International Cooperative Alliance, a nongovernmental association founded in 1895 that represents and serves cooperatives worldwide, defines a cooperative as “an autonomous association of persons united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly-owned and democratically-controlled enterprise….” Ranging from small-scale to multi-million dollar businesses across the globe, co-operatives employ more than 100 million women and men and have more than 800 million individual members’ (International Cooperative Alliance [ICA] 2005).

Cooperatives are usually classified as consumer-owned, producer-owned, or worker-owned (or a hybrid of some combination of the stakeholders). For example, consumers come together and form a buying club or a cooperative grocery store in order to obtain the goods they need at an affordable price, particularly where fresh produce and natural and vegetarian foods are not supplied.
Cooperatives elsewhere or are very costly. In some places consumers also come together to buy electricity, environmentally friendly fuels, pharmaceuticals, child care, financial services (as in a credit union), or almost any good or service. Cooperative retail enterprises such as natural-food grocery stores and rural electric and energy cooperatives are some of the most numerous and successful examples. Cooperative financial institutions such as credit unions are some of the most widely used cooperatives. They make financial services and loans available in underserved communities, and keep financial resources circulating in the community. Producers also form cooperatives to jointly purchase supplies and equipment and/or to jointly process and market their goods, particularly in agriculture and arts and crafts. Workers form cooperatives to jointly own and manage a business themselves, to save a company that is being sold off, abandoned, or closed down, or to start a company that exemplifies workplace democracy and collective management. Worker-owned businesses offer economic security, income and wealth generation, and democratic economic participation to employees, as well as provide meaningful and decent jobs and environmental sustainability to communities (see Gordon Nembhard 2004b, 2002; Haynes and Gordon Nembhard 1999). Cooperative housing expands home or apartment ownership to more people, addressing both financing and maintenance issues, and often builds in long-term affordability. Cooperative ownership is growing in the provision of social services such as home health care, health care, drug rehabilitation, and child care; and in the area of fair trade.

DEMOCRATIC OWNERSHIP
Cooperatives, particularly worker-owned co-ops, are a form of democratically owned economic enterprises that allow members to control their own income and wealth, stimulate the local economy, address market failures, and be agents of change in their local sphere. Cooperatives are characterized by pooling of resources, joint ownership, democratic governance, and sharing risks and profits in the production, distribution, and/or acquisition of affordable high-quality goods and services. Cooperative businesses operate according to a set of agreed-upon values and principles or guidelines that have evolved over the past 150 years. The seven key principles are: voluntary and open membership; democratic control by members (based on “one member, one vote” rather than voting according to number of shares of stock owned); members’ economic participation (returns based on use); autonomy and independence (self-help organizations controlled by members); continuous education, training, and information; cooperation among cooperatives; and concern for community (see International Co-operative Alliance 2005; Thordarson 1999). These seven modern cooperative principles are based on the values and principles set forth by the Rochdale Equitable Pioneers Society, started in 1844, whose original members are considered to be “the founders of the Co-operative Movement” (ICA 2005; also Holyoake 1918 and Laurel House Co-op and Laurel Net Cooperative 1999.)

COOPERATIVE ECONOMICS, MARKET FAILURE, AND MULTIPLIERS
Cooperatives often develop and survive as a response to market failure and economic marginalization (see Fairbairn et al. 1991). Worker-owned cooperatives and other democratically owned businesses are some of the most innovative and empowering arrangements for bringing together labor and capital in an equitable and productive relationship. Cooperative economic development has been successful as an urban as well as rural economic development strategy to create jobs, increase incomes (and sometimes wealth), and reduce poverty around the world. Although cooperative models are not well known or well publicized, the United Nations and the International Labor Organization have recently recognized the potential of cooperative enterprises for economic development and poverty reduction (Birchall 2003; International Labour Conference 2002).

Some of the issues that cooperatives address are: local development in an increasingly globalizing world; community control in an age of transnational corporate concentration and expansion; social and community entrepreneurship, particularly when business development is increasingly complicated and especially risky; pooling of resources and profit-sharing in communities where capital is scarce and incomes low; and increased productivity, superior working conditions, and high worker satisfaction in industries where work conditions may be poor, and wages and benefits usually low. There is evidence to suggest that cooperatives lead to superior value creation. David Levine and Laura D’Andrea Tyson surveyed the research and found that “both participation and ownership have positive effects on productivity” (1990). Levine and Tyson also point out that many researchers note the superior working conditions in cooperatives:

For example, the European worker co-ops, which have been the subject of extensive empirical inquiry, typically have managements committed to employee ownership and representation, job security, compressed status and compensation differentials, and guaranteed worker rights…. The results have been more consistently favorable in correlating worker ownership and management with lower turnover, absenteeism, and higher
worker satisfaction…. In almost no cases does participation make things worse. (Levine and Tyson 1990)

In a comparison of social and economic indicators in three towns in northern Italy with similar demographics but different levels of cooperative ownership, David Erdal (1999) found that citizens in Imola had a better quality of life than in the other two towns with fewer or no cooperative enterprises. Imola, with 25 percent of the workforce employed in cooperative businesses, is reputed to be the town with the largest number of cooperatives in Italy and Europe. In total, Imola scored highest (positively) on seventeen of the nineteen combined measures about quality of life. Experience of crime, police activity, cardiovascular mortality, and perception of gap between rich and poor, for example, were all lowest in Imola. Positives such as confidence in government, perceiving politicians to be on your side, posteducation training rates, and physical and emotional health, were all highest in Imola.

Cooperatives develop out of the wealth of cultural and social capital in communities, whose diverse residents often have strong social networks and few options but to work together. Cooperatives create social efficiencies derived from the democratic participation of all, self-help, self-management, and concern for community principles that guide them. Cooperatives encourage interaction, teamwork, intercooperation, and giving back to one’s community. They also develop social ties among members and between members and the community—that is, social capital—so that networking and working together become the norm, and the skills to facilitate this are developed in all members. Gordon Nembhard and Blasingame (2002) find that co-op members and employee owners become used to the transparency and accountability in their own organizations (e.g., open-book policies, “one member, one vote,” shared management, etc.). They come to expect transparency and accountability and help recreate this in civil society and political arenas. Many members become more active in their communities in general, taking on leadership roles both in their co-ops and in voluntary and community organizations (this was found especially with women members and in communities of color). In addition, citizen activism and advocacy often can be effective countervailing forces that increase democracy and participation.

PROMOTING RACIAL AND ETHNIC ECONOMIC INDEPENDENCE

Cooperative enterprises are a particularly effective and responsive way for subaltern populations to participate economically. Because subaltern peoples are discriminated against in mainstream labor, capital, and housing markets, they often have to rely on one another and work together. Subaltern populations often have little personal wealth and are excluded from much of mainstream prosperity and economic stability: The market system does not often work for many members of subaltern groups.

Examples such as the Mondragon Cooperative Corporation (MCC) illustrate the economic power of the combination of ethnic solidarity, democratic ownership and participation, and interlocking economic activities. The Mondragon Cooperative Corporation is a complex of more than 150 industrial, financial, distributional, research, and educational cooperatives, mostly worker-owned, in northern Spain. The holding corporation is “rooted in grassroots networks of cooperative businesses owned by Basque nationalists” who chose cooperative enterprise development as a means to assert their economic independence (see Gordon Nembhard and Haynes 2002). The first cooperative was a worker-owned and worker-managed ceramic heater factory, started in 1956 by graduates of a community-run alternative “polytechnical” high school founded by a priest who taught cooperative economics and worker ownership. Additional cooperatives developed using the same model. Early members also established a credit union, Caja Laboral, that has continued to supply financing, technical assistance, and research and development for future cooperatives. Caja Laboral has become the seventh largest bank in Spain and is the MCC’s engine of growth, supporting cooperative development as well as facilitating economic stability among the cooperatives in the system. Other schools and a university were established to support the growing worker-owned factories in the network. The complex of cooperatives also established its own social security system (Lagun-Aro) early on, when the government of Spain would not allow the member-owners to participate in the national system because they were considered to be self-employed. The association grew into a multibillion-dollar cooperative network of manufacturing, service, educational, financial, and distributive enterprises. Trends continue to show progressive growth in assets, sales, and workforce. In 2005, for example, total sales for all the cooperative’s companies exceeded $11 billion euros (U.S. $15 billion); total assets were greater than $22 billion euros (U.S. $29 billion). The workforce reached 78,455 in 2005—81 percent of whom were member-owners (Mondragon Corporacion Cooperativa 2006). The fifty-year success of this cooperative holding company and its affiliated companies can be explained best and most fully when the panoply of economic, social, cultural, and political market and nonmarket forces involved are analyzed.

Freedom Quilting Bee in Alberta, Alabama, is another example of a successful cooperative organization that organized itself based on cultural and social solidarity as well as economic need and affinity (Rural Development Leadership Network 2002). In the mid-1960s a group of
African American women in sharecropping families in Alabama formed a craft cooperative to pool their resources to produce and market quilts to supplement their families’ earnings. Sharecropping, a system of debt peonage, did not provide self-sufficiency for black farmers. In addition, during the civil rights era, white landowners were evicting black families from the land if they tried to register to vote or were involved in civil rights activity. The co-op helped the women buy sewing machines and other supplies, provided a place for them to quilt together, and marketed and distributed the quilts around the country, including through the Sears Roebuck catalog. The cooperative was so successful that it bought land, built a small sewing factory, started a day care center, and by 1991 was the largest employer in their town. In addition, the co-op was able to use its land to help sharecropping families relocate and eventually buy their own land, especially after they were denied access to their traditional farms because of their political activity. The income earned also was an important supplement to the meager income their families made from farming. In 1967 Freedom Quilting Bee was one of the founding members of the Federation of Southern Cooperatives—a predominantly African American cooperative development nonprofit organization with agencies in six southern states (Federation of Southern Cooperatives/Land Assistance Fund 1992, 2002).

**BIBLIOGRAPHY**

Coordination Failure

The notion of coordination failure can be understood by considering the simple coordination game in Table 1. In this game, Player 1 and Player 2 simultaneously and independently choose action A or B. The numbers in the table represent the payoffs associated with the different outcomes of interaction. If both players choose option A, both get a payoff of 1, if both choose B, they both get a payoff of 2, and if one player chooses A and the other B, the one who chose A gets 1, the other gets 0.

Coordination games, as outlined by Russell Cooper in his 1999 work, are characterized by multiple equilibria. In the following example, both players choosing A and both players choosing B are equilibria (in addition, there is a mixed-strategy equilibrium in which both players choose A and B with a probability of $\frac{1}{2}$). These equilibria are Pareto-ranked, meaning that both players are better off in one equilibrium than in the other. In the example, both players are better off if they coordinate on action B than if they coordinate on action A.

Coordination failure prevails if players coordinate on the inefficient equilibrium (here: both choose A). Coordination failure is an equilibrium phenomenon because given that one player chooses A, it is in the interest of the other player (i.e., it is a best reply) to also choose A. In colloquial language, the failure to coordinate on any equilibrium is sometimes also called coordination failure. It is more precise to talk about miscoordination in this case because a non-equilibrium phenomenon is concerned.

Coordination failure suggests an efficiency-enhancing role for policy intervention and collective action. If agents are in a Pareto-inferior equilibrium, individuals cannot move to the superior equilibrium by individual action (lock-in effect). In contrast, a coordinated move is necessary to reach a Pareto-superior equilibrium.

Coordination failure arises because of strategic uncertainty, not because a conflict of interest prevails. While choosing B is attractive because it possibly yields a higher payoff, it is also risky to choose B. If one player is uncertain that the other player will choose B, he might choose the safe option A. Therefore, confidence and expectations are important determinants of coordination failure.

Multiple equilibria arise in coordination games because of strategic complementarity, meaning that the optimal decision of one agent is positively dependent on the decisions of other players. Coordination games also exhibit positive spillovers in that the payoffs of one player increase as the action by the other player increases (assuming that action B represents a higher level of activity than action A).
EXAMPLES OF COORDINATION FAILURE

More elaborate versions of the coordination game in Table 1 with more than two players and two actions have been used to explain coordination failure in many contexts.

Teamwork Suppose two workers produce a joint output by providing costly effort and both are paid according to team output. Both workers are better off if both exert high effort (action B in the table) and coordination failure prevails if both provide low effort.

Education Acquiring education might be less profitable if others are not educated. If all agents expect others to acquire little education, investments in education might remain low.

Bank Runs If most creditors leave their savings in the bank, the bank is liquid and it is optimal to leave the savings in the bank. If all other creditors withdraw their savings, the bank becomes illiquid and it is best to also withdraw one’s savings. A similar reasoning has been used to account for speculative currency attacks and decisions to refinance businesses on the verge of bankruptcy.

Search and Matching If few agents use a specific medium to search for a partner, the other players have little incentives to use this medium because of the low likelihood to find a good match in a “thin market.” Coordination failure might therefore explain low intensity of search for employment. A similar reasoning has been used to explain failure to adopt superior technological standards or languages. Applications in development economics emphasize path-dependence and lock-in, suggesting that an economy might be stuck in a development trap today because agents failed to coordinate, possibly due to historical accident, on a Pareto-superior equilibrium in the past.

Macroeconomics Coordination failure has many applications in macroeconomics. A classic example refers to investments and expectations of future output. If most firms expect future aggregate demand to be low, they invest little today. This, in turn, induces low aggregate demand today, which might be interpreted as confirming low expectations. A recession might therefore result from self-fulfilling expectations. The literature on “sunspots” suggests that expectations might be coordinated by irrelevant events or information. For example, leading indicators of macroeconomic activity might be particularly accurate as long as economic agents believe they are good indicators.

The empirical relevance of these examples is contested in the literature because theories of coordination failure are difficult to test in the field. Economists have therefore sought to test the determinants of coordination failure in a broad range of coordination games in the experimental laboratory. Experimental economists have investigated elaborate versions of the game in Table 1, pure coordination games (in which equilibria are equally good, i.e., not Pareto-ranked), and asymmetric games (in which agents coordinate on different actions).

Coordination problems are related to but distinct from cooperation problems. The coordination game in Table 1 is transformed into a cooperation game (a prisoner’s dilemma) if the payoffs in the lower left cell are changed to (0,3) and in the upper right cell to (3,0). Actions A and B are often called defection and cooperation. The resulting cooperation game has a unique and inefficient equilibrium [payoffs are (1,1)]. A rational and self-interested player chooses A (i.e., free-rides) irrespective of what the other player chooses in the cooperation game.

COPING

The stresses inherent in the daily challenges of life create a need for continuous monitoring and adjustment. Coping is the behavioral, cognitive, and emotional process of managing a stressful or threatening situation or circumstance. It is a nearly continuous process as people are frequently confronted with new and changing environmental demands that can lead to stress. Minimizing, mastering, or managing a situation in such a way as to render it less distressing is the goal of coping.

Richard Lazarus (1966) offered a three-process model of stress. Primary appraisal is the process of perceiving a threat to oneself. Secondary appraisal is the process of call-
ing to mind a possible response to the threat. **Coping** is the execution of the response to the threat. The body has its own way of coping with stress. Any threat or challenge an individual perceives in the environment initiates a sequence of neuroendocrine events. These events are conceptualized as two separate responses: a sympathetic/adrenal response, in which catecholamines (epinephrine, norepinephrine) are secreted (i.e., the “fight or flight” response), and the pituitary/adrenal response, involving the secretion of corticosteroids, which act to restore the biological system to homeostasis (Frankenhauser 1986).

**TYPES OF COPING**

Lazarus and Susan Folkman (1984) were the first scholars to make the distinction between problem-focused coping and emotion-focused coping. Problem-focused coping seeks to ameliorate the stress being caused by a given situation by identifying and making efforts to deal with the source of the problem. It may involve taking action to remove a stressor or to evade a threatening stimulus. For example, changing trails to avoid a snake while on a nature walk would be an example of the problem-focused method of coping: By effectively removing oneself from the threatening situation, one lowers the stress it induces.

The goal of emotion-focused coping is to reduce the intensity of distressing emotions associated with stress—that is, the aim is to make oneself feel better about a real or perceived threat or stressor without addressing the source of the stress. Emotion-focused coping often occurs when problem-focused coping fails to reduce the stress in a situation or when the stressor is so great that problem-focused coping has no real likelihood of helping. It can also come into play when many aspects of a situation are out of one’s control, such as when one is dealing with a terminal illness or the sudden death of a loved one.

Charles Carver and his colleagues (1989) developed an instrument to measure coping responses based on a number of conceptually distinct methods of responding to stressful life events. **Active coping** involves taking steps to remove oneself from a threatening situation. **Planning** involves generating strategies to cope with the stressor. Other strategies include **reinterpreting the stressor** as a positive or growth-oriented experience, **suppression of competing activities** (i.e., putting other concerns aside until the stressor sufficiently subsides), **restraint coping** (i.e., waiting for an opportunity to act effectively), **focusing on and venting of emotions** (i.e., expressing grief or “venting” anger), using **humor** to cope with the stressor, **mental or behavioral disengagement** (i.e., giving up on trying to solve a problem or reach a goal), **seeking social support**—either **instrumental support**, such as information or resources, or **emotional support**, such as sympathy and understanding— **turning to religion** (i.e., putting the problem in God’s hands), and **acceptance**, whereby the threat is accepted as unavoidable (as with, for example, terminal illness).

Sometimes the nature of a stressor is such that it overwhelms an individual’s coping resources. When this occurs, rather than engaging in positive coping strategies, the person sometimes seeks to disengage from the stressful situation altogether. This emotion-focused strategy is called **avoidant coping** and its goal is to escape or avoid feelings of distress. Denial of the existence of the stressor, for example, can be negative if it causes one to neglect to seek medical attention when symptoms of a possibly serious disease appear. Substance use (i.e., using alcohol and/or drugs) can aid in this disengagement from reality, but only for a time. People may also engage in “magical thinking” in an attempt to wish away a stressor. Unfortunately, in the end the stressor remains, and will inevitably resurface.

**SOCIAL SUPPORT AND COPING**

It is now widely accepted that receiving effective social support from one’s social network can play a role in influencing health and well-being. The two main theories of how social support impacts stress and coping are the **main effect hypothesis**, which asserts that social support is beneficial whether or not one is experiencing increased stress, and the **stress buffering hypothesis**, which asserts that social support during time of elevated stress serves to protect an individual from a stressor’s harmful effects (Cohen and Wills 1985).

Social support can take many forms. These include **instrumental support** (e.g., providing a family member with money to buy groceries), **informational support** (e.g., providing information about an illness), and **emotional support**—that is, providing care or comfort. For such support to be effective, however, it must be matched with the environmental demands causing the distress and be provided by the appropriate member of one’s social network.

**CONCLUSION**

Often, the best coping strategies are a combination of problem-focused and emotion-focused strategies, which together engage the stressor in an effort to reduce both its force and the negative emotions it evokes. Seeking social support in times of elevated stress can also be an effective coping strategy. When one is faced with stress that greatly exceeds one’s ability to cope, professional services may be helpful, both in strategizing ways to deal with the stressor and as a source of emotional support.

**COPPER INDUSTRY**

The copper industry's growth and prosperity are based on the metal's inherent properties: an attractive appearance, high conductivity, good corrosion resistance, ability to alloy with other metals, and ease of working. While there are substitutes in specific uses, copper has entrenched and expanding markets in the electrical, electronic, and communications industries. Electrical and electronic products, including power cables, account for over one third of total usage, and construction, including wiring and water tubing, for a similar share. Transport industries use roughly one eighth of the total, industrial machinery and equipment nearly one tenth, and a wide range of consumer and other products the remainder. Global demand, which moves in step with capital expenditure, especially on construction and infrastructure, and with spending on automobiles and consumer durables, has increased from 3.7 million tonnes in 1960 to 6.8 million tonnes in 1970, 9 million tonnes in 1980, 10.9 million tonnes in 1990, 15.1 million tonnes in 2000, and 16.5 million tonnes in 2005. The annual average rate of growth is 3.1 percent, but with marked annual and geographical variations. The geographical center of demand has altered, with the most rapid increases in China, India, and the countries of the Asia-Pacific Rim. In 1980 the main markets were the countries of the European Union of 15 (30 percent), the United States (21 percent), the USSR (12 percent), and Japan (13 percent). By 2005 China had gained first place with 22 percent and the Asia-Pacific region had 14 percent. These increased shares were only partially offset by the collapse of demand in the former Soviet Union and its European satellites. In recent years demand has flattened out, or even fallen, in the United States (14 percent of the 2005 total), Japan (7 percent), and many of the European Union of 15 (20 percent) as their economic activity has become increasingly dependent on service industries and imported manufactures. Global turnover amounted to $21 billion in 2002 and $60 billion in 2005, with increased prices explaining most of the rise. World exports of refined copper metal accounted for 38 percent of production, worth almost $23 billion, in 2005.

Copper is priced on terminal markets, mainly the London Metal Exchange, and prices fluctuate with changes in the balance between supply and demand and with general economic and financial conditions. Whereas demand is cyclical, supply tends to be relatively inelastic as mines need to spread heavy fixed costs over as high an output as possible. The industry is a modest employer of labor, but is capital intensive at both the mining and refining stages. Volatile prices can be hedged in forward markets, but nonetheless create problems for producers and consumers alike. For example, the daily cash price fell from $3065/tonne on January 20, 1995, to a low of $1319/tonne on November 11, 2001, and rose to a high of $4650/tonne on December 28, 2005. The annual averages were $2934/tonne in 1995, $1560/tonne in 2002, and $3684/tonne in 2005. High prices both encourage substitution by other materials, and lead governments and labor to press for increased shares of profits. Weak prices inhibit substitution by other materials, and lead governments and labor to press for increased shares of profits. Weak prices inhibit exploration and new investment and may force the closure of higher cost mines.

The relatively strong growth of demand since the late 1980s has been facilitated by changes in the structure and nature of supply. Global mine production of copper was about 15 million tonnes in 2005, with the balance of demand for refined copper metal met from recycled materials. In many instances ores contain other payable products as well as copper, which can contribute considerably to mine profitability, and can influence production patterns. Because individual ore deposits are finite, continued spending on exploration and mine development is required merely to maintain output, let alone satisfy rising demand. Improved exploration techniques have partly offset the tendency for the average grade of copper ore to fall with the depletion of the richer and most accessible ore deposits. Also, technological improvements and rising mine size have tended to neutralize any impact of falling average grades on production costs. During the 1990s output became increasingly concentrated in large open-pit mines, where economies of scale more than offset the relatively low grades of contained metal in the ore. In 2004 the three largest mines produced about 2.5 million tonnes, or 15 percent of output. The annual copper output of the median mine grew from 75,000 tonnes in 1980 to 110,000 tonnes in 1990 and almost 200,000 tonnes in
2000. Larger mine sizes and falling average grades have greatly increased the local environmental impact of mining, as greatly increased volumes of waste and overburden have to be moved per tonne of recovered metal. Energy needs have also risen sharply. Most mines are located in relatively unpopulated areas, but social and community tensions can arise when they are developed near population centers, particularly where indigenous peoples are involved.

With the exhaustion of many small high-grade mines in Europe and parts of North America since the late 1980s, the geographical focus of output has shifted. That shift has been accompanied by changes in patterns of ownership. Whereas the shares of leading companies in total output have not altered significantly, the identity of those leading companies has changed markedly. During the 1950s, 1960s and early 1970s, many mines were wholly or partially nationalized, largely but not entirely in developing countries in accordance with the then-prevailing ethos of national ownership and control of mineral resources. In countries such as Chile, Zambia, and Zaire, foreign-owned mining companies had dominated, or even distorted, the local economy and exerted considerable political power, often fueling strong local resentment. Some nationalized U.S. companies, like Anaconda in Chile, blocked foreign aid and further investment in their former host countries in the 1970s. The greater part of U.S. mine output was acquired by oil companies during the 1970s. (For example, Anaconda Copper’s Chilean assets were nationalized in the 1960s and early 1970s, and its remaining assets were acquired by Atlantic Richfield in the late 1970s.) Subsequent decades have witnessed the complete withdrawal of the oil companies from copper production, and the privatization of copper projects in many countries. As of 2007 only Chile retains a significant state holding, through Codelco, but the company now coexists with privately owned companies and accounts for only 35 percent of a greatly expanded Chilean output, compared with about 82 percent in the early 1980s. Elsewhere, state-owned producers generally failed to invest sufficiently to sustain their output and remain competitive. U.S. mine output collapsed from 1973’s 1.6 million tonnes to 1 million tonnes in 1983, and it would have fallen further but for the oil companies’ investment and the application of new technology. Until the late 1970s most copper ore was crushed, concentrated by a variety of means, and then smelted and refined. Not all ores are amenable to processing by such means and oxide ores were often left untreated. Acid leaching, followed by solvent extraction and electro-winning (SX-EW) enabled the treatment of such ores and waste dumps, often at low costs, and these hydrometallurgical processes were suitable for many deposits in the Southwestern United States. In consequence, U.S. mine output expanded to 1.8 million tonnes in 1993 and 1.9 million tonnes in 1996, only to contract to 1.1 million tonnes by 2003, after prices had collapsed cyclically in the late 1990s.

Many South American copper ores are amenable to SX-EW processing and by 2004 the technique accounted for 18 percent of global mine output. One advantage is that the process produces saleable copper metal rather than intermediate products requiring further processing. Russian production fell with the collapse of the Soviet Union, and output fell during the 1980s and 1990s in Europe, Canada, Central Africa, and the Philippines. The number of producing countries has dwindled along with the number of mines. As of 2007 Chile accounts for 35 percent of global mine output, followed by the United States (8 percent), Indonesia (7 percent), Peru (7 percent), Australia (6 percent), and Russia (5.5 percent). The leading five copper mining companies supply 38 percent of global output, and the top ten 58 percent—similar shares to those of the mid 1970s. The five leading companies are Codelco (12.7 percent of 2004’s output), BHPBilliton (7.3 percent), Phelps Dodge (7.1 percent), Grupo Mexico (6.1 percent), and Rio Tinto (5.1 percent).

There is large global trade in ores and concentrates (28 percent of total mine output, and 34 percent of the output of concentrates) as not all copper is smelted and refined at, or near, the mine site. Some smelters and refineries continued to produce from imported raw materials when local mines were depleted, and some countries, like Japan, Korea, and China, deliberately fostered metal production for strategic or developmental reasons. The main countries producing copper metal are Chile (17 percent), China (15 percent), European Union of 15 (11 percent), Japan (8 percent), and the United States (7 percent). The ownership of copper refineries is rather less concentrated than that of mines, with the ten leading companies having 50 percent of output, rather less than in the mid-1970s.

COPTIC CHRISTIAN CHURCH

The identity of the Coptic (i.e., Egyptian) Orthodox Church is based on the foundation of the patriarchate of Alexandria by Mark the Evangelist. He is regarded as the first in an unbroken line of patriarchs represented in 2007 by Pope Shenuda III who, like the Greek Orthodox patriarch, is called the Pope of Alexandria and all Africa. The patriarchate is in Abbasiya, Cairo, in the complex of the Coptic Cathedral of Saint Mark, and there are roughly 8 million believers across the country.

Egyptian patriarchs of Alexandria wielded great influence at the various councils convened to reconcile disputes that plagued the early church. In 325, Alexander and his papal successor Athanasius subscribed to the Nicene Creed that God the Father and Christ the Son were full and equal participants in the Godhead; Arius, who presented that the Son was subordinate to the Father, was banished. When Constantinople gained the prestige that once belonged to Alexandria, Arius was recalled and Athanasius was driven into exile on five occasions, which coincided with the appointment of Arian bishops in Alexandria. The dispute was finally resolved in the Council of Constantinople in 381 when the Nicene Creed, defended for decades by Athanasius, was reaffirmed.

The tremendous cultural revival of the Coptic Church from the 1950s, mainly initiated under Pope Kyrollos and continued under Pope Shenuda, includes a missionary movement has resulted in the establishment of six Coptic Orthodox Churches in Africa.

The Coptic Church is committed solely to the first three ecumenical councils: Nicea (325), Constantinople (381), and Ephesus (431), where Saint Cyril of Alexandria, champion of Christian orthodoxy, was honored for his defense against Nestorianism and for his definition of faith as expressed in the Coptic Synaxarium: “The Union of the Word of God with the flesh is as the union of the soul with the body, and as the union of fire with iron, which although they are of different natures, yet by their union they become one. Likewise, the Lord Christ is One Christ, One Lord, One Nature and One Will.”

In the year 570, Copts appointed their own “pope and patriarch” residing at Wadi Natrun, west of the Delta. Egyptian Orthodox Christians henceforward ignored ecclesiastical representatives from Constantinople, adopted a Calendar of the Martyrs that begins its era on August 29, 284 in recollection of those who had died for their faith in the reign of Diocletian, translated the whole of the New Testament into Coptic, and followed the teachings of Saint Mark.

Periods of peace and persecution comprise the history of the Coptic Church. The Persian army destroyed churches and monasteries in 617. The religious life of the Copts suffered relatively little after the Arab invasion in 641, provided they paid a tax, but when repressive laws were later imposed, they drove the Copts to revolt on several occasions. The Church generally flourished under the Fatimids (969–1171), when there was a revival of Coptic identity, but this was followed by persecution under the Ayyubids (1171–1250). With the rise of the Mamelukes, churches and monasteries were plundered and destroyed, Copts became a small minority, and pressure continued under the Ottomans (1517–1808).

The position of the Coptic Church improved under the enlightened rule of Mohamed Ali’s dynasty in the nineteenth and twentieth centuries. In the 1950s nationalization and “Arabization” policies under Egyptian president Gamal Abdel Nasser resulted in an exodus of a professional class abroad, including Copts. There are more than 80 Coptic Churches in the United States and Canada, 26 in Australia, and some 30 in Europe. A missionary movement has resulted in the establishment of six Coptic Orthodox Churches in Africa.

Since the 1970s, Pope Shenuda has instigated theological discussions with the Roman Catholic Church, and the Greek and Oriental Orthodox Churches, with view to the Copts being fully accepted as Orthodox Christians by all members of the world community. In fact, ecumenical discussions at the Vatican in 1973 led to a general acceptance of the above-mentioned Christological formula of Saint Cyril of Alexandria.

CORN LAWS

The British repeal of the Corn Laws in 1846 is usually seen as the beginning of a unilateral move to free trade that served as the pivotal event in the spread of economic liberalization throughout western Europe. Historians have also seen the Repeal Act as reflecting Prime Minister Robert Peel’s (1788–1850) personal devotion to free trade. It was a powerful symbol of his desire to minimize the role of vested interests and state power in the functioning of the economy, even at great political cost to his party (Howe 1997).

But more recent, revisionist work suggests that the transition to a free trade regime did not come as swiftly nor as smoothly as the conventional narrative presents. Nor was the Corn Law repeal as important for the spread of free trade in Europe. Many of the most onerous tariffs and import restrictions that had distorted British trade throughout the eighteenth century remained in place for decades.

Though often seen as symbolic of the various tariffs and quotes on imports denounced by Adam Smith (1723–1790) in his indictment of the mercantile system in *The Wealth of Nations* (1776), the Corn Laws themselves mostly came after Smith’s great work. The Corn Laws referred to the various restrictions on both imports and exports of grain and related agricultural products put into place beginning in 1804, which were then followed by further restrictions culminating in the Corn Law of 1815. These laws, in turn, extended regulations in 1773 that had (1) prohibited exports of wheat when prices reached a preset level, and (2) imposed a sliding scale of duties on wheat that declined if market prices were high enough.

The intense attention paid to the political and ideological debates leading to the eventual repeal of these restrictions in the 1840s shows the danger of judging the economic importance of a legislative change by focusing on the political and cultural significance of that event. Whatever the symbolic meaning of the repeal for contemporaries, it is now clear that historical accounts of a lone free-trade Britain are inconsistent with an objective examination of the statistical record of British trade.

One of the reasons why the British tariff repeal has seemed so dramatic was the high level of British average tariffs in the 1820s (the *average tariff* is the value of all import duties as a fraction of the value of all imports). What matters is not how high the statutory level of tariffs was, but the level of tariffs for the goods that represented the bulk of British trade. (For a more technical analysis of the relative importance of British tariff restrictiveness based on a rigorous general equilibrium model, see Dakhlia and Nye [2004] and Nye [2007].) And British tariff levels were among the highest in Europe in the 1820s. Indeed, they were fully comparable to average tariffs for the United States, one of the most openly protectionist nations in the world. A comparison with Britain’s traditional rival, France, shows how exaggerated the tale of unilateral British free trade has been. For the first three quarters of the nineteenth century, average tariffs in Britain were consistently higher than they were in France, a nation that was avowedly not a free trader. More refined calculations also indicate that British tariff policies imposed a greater burden on British welfare than did French tariffs on French trade. Part of this is due to the fact that history has exaggerated the extent to which French policy was protectionist.

But the important point is that after the abolition of the Corn Laws, most of the duties that Britain abolished were on manufactures or on items of minor importance to trade. Because Britain had an absolute and comparative advantage in the production of textiles and other manufactures, the effect of these liberalizations on British trade was muted. Though Britain in the 1850s had only a few tariffs, they were set at very high levels and were imposed on consumables such as wine, spirits, tea, coffee, and sugar that composed a large portion of British import trade.

Central to the system were the nearly prohibitive tariffs on wine and spirits—imposed after the War of Spanish Succession in the early 1700s—which were designed to spite Britain’s enemy, France, and favor British allies such as Portugal. Britain had been especially concerned with its large trade deficit with France, and the war gave a pretext for crippling the French trade. Despite this, Britain ran a
Corporal Punishment

merchandise trade deficit for much of the eighteenth century and all of the nineteenth. The 1804 Methuen Treaty—cited as a prime example by Adam Smith of the old mercantilist system—established a permanent preferential tariff for Portuguese wines and spirits in exchange for continued British export access to Portuguese markets. Given that almost all Portuguese alcoholic exports went to only one nation, Britain, as a result of this preference, this gives the lie to David Ricardo’s (1772–1823) famous example of trade between Britain and Portugal as illustrative of the virtues of comparative advantage.

High tariffs on imported wines and spirits, as well as on substitute beverages such as tea and coffee, had the effect of protecting domestic producers of beer, whiskey, and other spirits. Complicated preferential tariffs also favored colonial products such as rum.

The truly major change came about with the 1860 Anglo-French Treaty of Commerce brokered by Richard Cobden (1804–1865) and Michel Chevalier (1806–1879). Despite the correct claims of committed free traders that unilateral tariff reductions were first-best, the unwillingness of Britain to lower wine tariffs prior to 1860 did little to inspire other nations to move to free trade. However the 1860 treaty led to France removing all prohibitions on British textiles and lowering the overall level of tariffs in exchange for British concessions on wine and spirits. This event, not the repeal of the Corn Laws in the 1840s, was in fact the true start of European free trade. By 1870 almost all of the leading powers in Europe were to sign most-favored-nation trade treaties with Britain and France, thus leading to the rapid creation of a truly extensive and open trading network. Where mere exhortation had done little to induce other nations to liberalize commerce, the threat of being excluded from trade arrangements between the two great European powers was the critical incentive for a sustainable liberal trade regime.

The only major exception in the Western world was the United States. Whereas most nations in Europe were lowering tariffs in the 1860s, the United States began to raise tariffs significantly. To some extent, these restrictions were partially offset by the openness of world capital markets and by America’s liberal immigration policy, which allowed free movement of labor.

Toward the end of the century, concerns about falling grain prices due to increased imports from the East caused France and Germany to raise tariffs and abandon the most-favored nation system. But trade in Europe remained fairly open, and British tariffs were at an all-time low. This happy period of open European trade would only be destroyed with the coming of World War I (1914–1918).

CORPORAL PUNISHMENT

Corporal punishment, including spanking, slapping, paddling, or the prolonged maintenance of a physically uncomfortable position, can be defined as the intentional infliction of physical pain in response to a child’s misbehavior that has the goal (whether it is met or not) of correcting the misbehavior. A complicated and controversial issue, however, is where to draw the line between corporal punishment and physical abuse. Incidents of physical abuse often develop out of parents’ disciplinary behaviors. For example, routine discipline may cross the line to become physically abusive if parents cannot control their anger, are unable to judge their own strength, or are unaware of children’s physical vulnerabilities. Nonabusive parents are likely to tailor their punishments to children’s misbehaviors, but abusive parents appear to use physical punishment indiscriminately. Moreover, physical abuse appears to be part of a constellation of parenting behaviors that also includes authoritarian control, anxiety induction, and a lack of expressed warmth toward the child.

One argument is that any form of corporal punishment constitutes physical abuse. Indeed, several countries have outlawed the use of corporal punishment. In 1979 Sweden became the first country to do so, adding a provision to the Parenthood and Guardianship Code stating, “Children are entitled to care, security and a good upbringing. Children are to be treated with respect for their person and individuality and may not be subjected to corporal punishment or any other humiliating treatment.” Prior to the 1979 ban, more than half of the Swedish population believed that corporal punishment
was necessary in child rearing; just two years after the ban, the rate was reduced by 50 percent, and by 1996, the rate was down to 11 percent. Decreases in rates of use of corporal punishment have accompanied changes in attitudes about its use (from nearly 100 percent before the ban to 40 percent by 2000). Several other countries, including Finland, Denmark, Norway, Austria, Cyprus, Latvia, and Croatia, have also outlawed the use of corporal punishment. Beginning in 1990 with the Convention on the Rights of the Child, the United Nations has placed the protection of children’s rights at the forefront of issues before the international community. More recently, the United Nations has launched a global study of violence against children. In his interim report to the General Assembly in October 2005, independent investigator Paulo Pinheiro stated that the “objective of the study must be to ensure that children enjoy the same protection as adults. It will challenge social norms that condone any form of violence against children, including all corporal punishment, whether it occurs in the home, schools and other institutions.”

Despite the banning of corporal punishment in several countries and the movement against its use in the international community, about 75 percent of American parents endorse the use of physical discipline, and over 90 percent of parents have used physical discipline with their children (Straus 1996). Individuals who argue that corporal punishment can be used effectively without constituting abuse suggest that corporal punishment should not be overly severe, that parents should be under control and not in danger of “losing it” from anger, that punishment should be motivated by concerns for the child rather than parent-oriented concerns, and that it should be used privately after a single warning with children ages two to six years and accompanied by reasoning (Larzelere 2000).

Across a wide range of countries, males are more likely to endorse the use of corporal punishment than are females, and parents are more likely to use corporal punishment with boys than with girls. Other demographic variables are also related to the likelihood of using corporal punishment. In particular, lower socioeconomic status, having more children, and being affiliated with a conservative Protestant religion are all related to using corporal punishment more frequently. African American parents have been found to use more corporal punishment than European American parents, even after controlling for socioeconomic status.

Cultural norms and parent-child relationships appear to affect how the experience of corporal punishment is related to children’s adjustment. Certain family and cultural contexts may moderate the association between parents’ behavior and children’s adjustment to the extent that they influence children’s construal of the parents’ behavior. Children who regard corporal punishment as a frightening experience in which their parents are out of control and acting in a way that is not accepted in their cultural context may interpret the experience as parental rejection (especially in the context of a parent-child relationship that is lacking in warmth) and may respond by escalating externalizing behaviors. On the other hand, children who regard spanking as a legitimate form of discipline that is normative in their cultural context may not interpret the experience of corporal punishment as their parents’ rejection of them (especially if the parent-child relationship is generally characterized by warmth), and corporal punishment in this context may not be associated with elevated levels of behavior problems. Ethnic differences in the meaning that children attach to being corporally punished may explain why corporal punishment is related differently to their subsequent externalizing behavior. Among European Americans, parents’ use of physical discipline has been related to higher levels of subsequent behavior problems in children, but this association is attenuated or reversed for African Americans. The finding has been replicated using different data sets and measures and controlling for potentially confounding variables. One purported explanation of these ethnic differences is that corporal punishment is more normative for African American than for European American families, which alters the meaning of corporal punishment to the child (Deater-Deckard and Dodge 1997). There is also some evidence that corporal punishment and children’s adjustment can be unrelated, if one takes into account parental characteristics such as warmth and involvement, which may offset the potentially deleterious effects of corporal punishment. For example, Vonnie McLoyd and Julia Smith (2002), who examined data from the National Longitudinal Survey of Youth, found that only in the context of low levels of maternal support did spanking predict an increase over time in mother-reported internalizing and externalizing problems.

In a study that addressed the normativeness hypothesis directly, findings from six countries (China, India, Italy, Kenya, Philippines, and Thailand) revealed that countries differed in the reported use and normativeness of corporal punishment and in the way that corporal punishment was related to children’s adjustment (Lansford et al. 2005). More frequent use of corporal punishment was less strongly associated with child aggression and anxiety when it was perceived as being more culturally accepted. In countries in which corporal punishment was more common and culturally accepted, children who experienced corporal punishment were less aggressive and less anxious than children who experienced corporal punishment in countries where corporal punishment was rarely used. In all countries, however, higher use of corporal
punishment was associated with more child aggression and anxiety regardless of the level of acceptance.

A paradox is that although individual differences in corporal punishment do not strongly predict individual differences in child aggressive behavior within cultures for which corporal punishment is relatively normative, cultures in which corporal punishment is normative have higher levels of overall societal violence. Carol and Melvin Ember’s 2005 analysis of ethnographies from 186 preindustrial societies found rates of corporal punishment use to be higher in societies that also had higher rates of homicide, assault, and war. Within the United States, corporal punishment is used more frequently in the South than in other regions, which is quite likely a reflection of the South’s greater acceptance of a “culture of violence” that encompasses higher homicide rates as well as milder forms of violence.

CORPORATE ETHICS
SEE Corporate Social Responsibility.
societies and hence demand that corporations modify their behavior.

WHAT DOES CSR IMPLY FOR CORPORATIONS?
Most corporations’ responses to the demand for CSR fall somewhere between two extremes. At one end, demonstration of concern for socially responsible behavior—behavior for which the firm has to incur additional expenditures—can generate goodwill among customers in the long run. Resulting expansion of the firm’s market actually makes the investment in CSR a profitable activity. In such cases investment in CSR is no different from investment in, say, an advertising campaign. It is judged on the basis of its effectiveness measured in terms of the firm’s profits. At the other extreme, CSR expenditure becomes an exercise in damage control when it is unlikely to benefit the firm in terms of sales. In most of these cases CSR expenditures become necessary to prevent damage to the corporate brand names from other activities of the firm. This happens if the public takes offense at some corporate activities that, by themselves, may be legal. Past examples include oil companies that have extracted oil with scant regard for the environment or pharmaceutical companies that have tried to charge high prices for their patented medicines well beyond what may be required to justify their research expenditures. If such CSR expenditures were not undertaken, consumers might reject the firm’s products or governments might impose stricter legislation that would become costly for the corporation in the long run.

There are many examples of firms that have combined social responsibility with profitable business. A frequently cited case is that of Body Shop. Its founder, Anita Roddick, expanded the firm from 1 outlet in 1976 to about 1,900 outlets in 50 countries by 2005 based on her philosophy of social and environmental responsibility while satisfying consumer needs with natural products. The first outlet was founded on these principles and it would be reasonable to conclude that the subsequent success of this firm was grounded on the philosophy of socially enlightened behavior.

Others have embraced CSR for its strategic value for the growth of the firm. Narayana Murthy, the founder of Infosys in India, is supposed to have created a multibillion-dollar information technology firm on the principles of social responsibility. Given his meager financial sacrifices for these activities, however, others have questioned whether the motivation for the public declarations of support for such behavior represents an enlightened attitude or merely an exploitation of the public’s gullibility (Sinha 2005).

At the other extreme, firms have adopted a strategy of being socially responsible to prevent backlash from regulators or consumers. Comeco, a Canadian mining company, followed a policy of awarding service contracts to the native people of northern Saskatchewan to bring them onside to oppose the provincial government’s attempts to impose strict regulations on uranium mining activities in that province. The higher cost of these service contracts with the natives was considered a good price to pay to avoid regulations and interference from nongovernmental organizations such as Greenpeace. It was later able to use the same strategy to avoid criticism in Kyrgyzstan after a potentially disastrous sodium cyanide spill in a village water supply.

Corporations appear to make a number of sequential decisions about their approaches to CSR activities. These decisions have to be made only for activities that are not required by law. Should they spend money on CSR activities when they do not have to? The answer would be yes if such activities would generate sufficient sales or would prevent loss of markets to competitors who are perceived as being more socially responsible. When not justified by economic profits, these activities will be undertaken when a costly backlash is expected from the consumers or the government.

RATIONALE FOR DEMANDS FOR CSR
To demand socially responsible behavior above and beyond what is legal is to recognize that ethical standards in a society should exceed the legal ones. Such a demand recognizes that the control of means of production of the society bestows strong powers on those who control them. With the control of means of production comes the temptation to control and manipulate the political and legal apparatus of the society.

From the point of view of the society, the essence of CSR is the clash between economic and noneconomic goals of the society. Pursuit of economic growth yields income that should result in higher welfare. However, what happens when, for example, the health insurance industry influences—legally—the political processes to ensure that the government does not provide health insurance to all citizens because such a move will reduce the number of people who buy insurance from firms within the industry?

How should this apparent conflict between economic and social goals be resolved? One approach would be to demand that those with economic power be held to ethical and moral standards that exceed what has been codified in the law. Mere adherence to the letter of the law would not be sufficient for those who control critical resources of the society. In this approach private enterprises will be judged not only on the products and services they provide but also on how they conduct themselves.
within the societies in which they operate. An opposite approach would be to recognize that the best strategy would be to completely separate economics and politics and ensure that economic interests are not allowed to influence the construction of the moral framework of the society. In this approach private enterprises will have to adhere strictly to the letter of the law but will not have to worry about being socially responsible.

CORPORATE STRATEGIES

The groups of individuals that make up a firm, or corporation, are responsible for determining its actions. Those decisions are made in the context of the markets in which the firm participates as manufacturer, seller, buyer, and competitor. By defining and categorizing strategies, firms can better understand their options and opportunities. Social scientists and policymakers can also investigate the reasons for firms’ success or failure and their contributions to society’s welfare.

To understand the motivations behind corporate strategies, one can think in terms of the individual members of the firm who make decisions or in terms of the firm acting as a single entity. In economics, the starting point is to think of the firm as indivisible—essentially as an extension of the owner-entrepreneur whose goal is to maximize profit. Expanding that assumption to encompass long-run profits can account for a large variety of observed behavior. Thus the profit motive helps one understand decisions not only concerning pricing or production in the firm’s current markets, but also investment to lower future costs and improve future quality, as well as decisions to enter markets that promise large future profits and exit markets that provide inferior profit opportunities. In this way many of the changes that occur in products and market structure over time can be described. Many business decisions that are not immediately recognized as profit maximization can be understood in these terms—generating growth, creating and maintaining competitive advantages over other firms, and improving the inputs available to the firm. Because the firm wishes to maintain profits today and in the future, it will take actions that are not immediately profitable but provide the firm with greater future profits, so that the project’s net present value of future profits exceeds the cost of implementation.

Milton Friedman’s (1953) assertion that firms behave “as if” they were profit maximizers, by arguing that firms that do not maximize profits will not survive, was intended to justify behavior that does not immediately appear to maximize profit. Although the literature has found this evolutionary argument difficult to support, improvements in modeling firms’ long-run goals have advanced understanding in the field.

Strategies can also be actions designed to make markets more amenable to the firm’s success by changing the attractiveness of rivals’ options (Bain 1956). For example, the firm can commit to large production by building additional manufacturing capacity or signing binding legal contracts. This in fact limits the firm’s options, but as a result is a credible commitment to substantial future production. Potential competitors can then observe that their entry will be less profitable, and as a result the incumbent firm can deter entry. As another example, firms that sell durable goods can benefit from committing to limit future sales (Bulow 1982). This causes the future resale value of present goods to increase, and customers are then willing to pay more for the goods today.

Of course, firms are made up of individuals whose goals and incentives are likely to differ from those of the owners. Thus “the firm” may take actions that are not those of a single profit-maximizing entity. Departures from the owner-entrepreneurs’ goals could be characterized as being caused by employees’ pursuit of their own self-interest. The principal (the owner or upper-level manager, for example) takes this constraint into account by appropriately adjusting the incentives of the agents (those that report to the principal). These internally motivated dimensions to strategy may affect the firm’s ability to pursue plans that would otherwise be optimal from the perspective of a single owner-entrepreneur.

As the firm interacts in markets, the description of its strategies can also be generalized with less precise foundations. In the business and management literatures, these generalized strategies serve as approximate heuristics for
practicing managers. Corporate and business-level strategies may focus on growth (new or existing markets, new or existing products), portfolio analysis (each project's market share, market growth rate, and resulting cash flow), matches between industry opportunities and the firm's strengths and synergies, or fiscal properties such as the creation of shareholder value. These strategies are most successful when they are based on fundamentals from economics: the anticipation of costs, customers' trade-offs, and rivals' reactions. Michael Porter (1980) organizes the forces that affect the industry into these categories: buyers' market power, suppliers' market power, the threat of entry, linkages to substitutes and complements, and rivalry among firms in the industry. The implementation of these strategies in markets requires research in segmenting the market along demographic, geographic, or behavioral categories. Positioning products in chosen segments is particular to the firm's marketing group. These strategies are usually framed in terms of the 4 P's—product, price, promotion, and place (or distribution). An important ingredient for success is the recognition of linkages between these dimensions.

Christopher S. Ruebeck

CORPORATIONS

The rise of the corporation to its position of world preeminence has its roots in the corporate consolidation of finance and industry in the late nineteenth century, most especially in the United States. Competition for capital globally and within the confines of the United States played a central role in the rise of U.S. multinational firms, as revealed by an amendment to the New Jersey corporation law of 1889. Until this date, there were only a few large corporate combines of more than $10 million, except in railroads (Horwitz 1992, pp. 83–90; Roy 1997). The amended New Jersey corporation law, designed by William Nelson Cromwell (1854–1948) and his lawyers from the firm of Sullivan and Cromwell and acceded to by the New Jersey State Legislature as a way to attract capital to its domains, helped change all this. Businesses worth hundreds of millions of dollars fled from New York and other locations to set up shop in New Jersey. By the dawn of the twentieth century, roughly seven hundred corporations worth some $1 billion had incorporated in the state (Lisagor and Lipsius 1988, p. 27). With the expenses of New Jersey now paid from corporate fees, and with other regions losing business, rival states adopted similar laws to attract capital, thus largely curbing state regulation of corporations (Horwitz 1992, pp. 83–87).

Competition for capital, which the German sociologist and economist Max Weber (1864–1920) argued was key to corporate influence over states in the world system, thus displayed its power in the United States. Immediately after the New Jersey law's passage, from 1890 to 1893, the rise of Wall Street and the securitization of finance and equity—a major aspect of the financial expansion of the later twentieth century—began. Corporate stock in the new industrial firms became listed on the stock market and was traded by brokerage firms, being publicly offered for purchase on the stock exchange in 1897 as the U.S. merger movement gathered steam. Stock offerings rose from $57 million to $260 million between 1896 and 1907, and the corporate concentration of U.S. capitalism, warned against by such observers as the French writer Alexis de Tocqueville (1805–1859), was solidified (Horwitz 1992, p. 95).

From 1875 to 1904 approximately three thousand companies merged or consolidated as a full third of the country's largest firms evaporated through mergers and vertical integration. This is roughly the same percentage of Fortune 500 firms (the largest publicly held firms in the United States) eliminated during the merger wave and corporate restructuring of the late twentieth century as investment bankers and corporate lawyers once again ascended to the top of the corporate hierarchy (Sobel 1998, p. 24). Morton Horwitz argues that “if the private law of corporations—that is, the law regulating relations within the corporation as well as with private parties—had not changed after 1880, it is difficult to imagine how the enormous corporate consolidation of the next thirty years could have taken place” (1992, pp. 85–86).

Much the same can be said of the wave of state-corporate globalization occurring in the first decade of the twenty-first century. The proliferation of multinational corporations and related supranational institutions is directly related to this early adumbration of transnational firms freed from territorial regulation in the late nineteenth century, with its earlier roots in the Madisonian emphasis on property rights in the U.S. Constitution. The
American sociologist C. Wright Mills (1916–1962) and others dated the supremacy of corporate power in the United States to the elections of 1866 and the Supreme Court decision in *Santa Clara v. Southern Pacific Railroad Company* (1886), which declared the corporation a person under the Fourteenth Amendment. However, Horwitz argues: “More probably, the phenomenal migration of corporations to New Jersey after 1889 made legal thinkers finally see that, in fact as well as in theory, corporations could do virtually anything they wanted.” (Horwitz 1992, p. 101). The subsequent replacement of the “artificial entity theory” of the corporation, which “represented a standing reminder of the social creation of property rights” by “the natural entity theory of the business corporation was to legitimate large-scale enterprise and to destroy any special basis for state regulation of the corporation that derived from its creation by the state” (Horwitz 1992, p. 104).

Corporations arose elsewhere, as exemplified by Japan’s zaibatsu—the unparalleled family-controlled banking and industrial collaborations exemplified by Mitsui, Mitsubishi, Dai Ichi Kangyo, Sumitomo, Sanwa, and Fuyo—and Germany’s heavy industrial corporations with links to universal banks. In the 2000s, of course, corporations extend their reach globally, with new corporate firms arising in such East Asian countries as China, Taiwan, and South Korea. With the growing power of corporate firms in the early twentieth century came increased attempts to regulate them, though in the United States antitrust legislation remained subordinate to the need to rely on corporations during wartime and in support of foreign policy. After the wave of nationalization that arose with the Russian, Chinese, and Cuban revolutions, U.S. corporations became increasingly contested and their relative freedom continued to be a mainstay of Western foreign policy.

In the aftermath of the Soviet Empire’s collapse in the early 1990s, thousands of corporate firms and their foreign affiliates control about half of the value of all goods and services in the global economy, while the Fortune 500 is responsible for roughly half of all profits in the U.S. economy. Despite free market rhetoric, corporations are often heavily subsidized by their states; these subsidies include military spending, which is exempted from World Trade Organization bans against certain types of subsidies. Corporate exploitation of developing countries occurs through the use of resources and labor, often through subcontracting, a practice exemplified by one of the world’s largest corporations, Wal-Mart. Meanwhile, foreign direct investment gives developed countries control over the economies of their junior partners. Simultaneously, limited liability serves to shelter shareholders and officers from corporate malfeasance, while the huge amount of money available for criminal defense often limits the severity of punishment for corporate crime, as evidenced in the wave of corporate accounting scandals involving such companies as Enron and Arthur Anderson in the early twenty-first century. Despite this, corporate advertising and public relations continue to be used to manipulate tastes for consumer goods and to put a positive public face on corporate business. In addition, lobbying associations such as the Business Roundtable in the United States represent the increased politicization of corporations as they use their immense power to influence legislation.

**CORPORATISM**

Corporatism is a system of interest intermediation in which vertically organized and functionally defined interest groups are granted official representation in the state policymaking apparatus. Corporatism is usefully contrasted with pluralism, a system in which interest groups openly compete with one another to gain access to the state. Under corporatist systems, groups such as labor and business are represented to the state by peak associations, which tend to be subsidized by the state. Other labor and business associations must thus work through these peak associations to gain access to the policymaking process. The major dilemma of corporatism is the balance between the autonomy and state control of interest groups.

Through the mid-twentieth century, corporatism was associated with the systems of interest intermediation found in Nazi Germany and fascist Italy. In the 1960s and 1970s, however, debate emerged over whether European industrial democracies were also characterized by corporatist arrangements. By the late 1970s, scholars had agreed that corporatism could indeed exist within democratic frameworks. They called this system *liberal* or *neocorpo-*. 

---
ratism, contrasting it with the state corporatism of earlier periods.

In the European democracies, corporatism was understood as either a response to or an accommodation of industrial capitalism. Neocorporatist systems allowed governments to facilitate consensus over economic policy by bringing together interest groups with significant stakes in the future of economic policy to negotiate with one another in a formal setting. In doing this, corporatist systems implicitly limited who would have the most influential voices in the economic policymaking process—and, as a result, helped shape the contours of the debate. For example, the Austrian Joint Commission on Prices and Wages—a corporatist arrangement that included the three largest agriculture, business, and labor associations in the country—was formed in 1957 to consider the future of Austrian economic policy. Sweden and Switzerland also developed particularly strong neocorporatist systems.

At the same time, scholars of the developing world generally—and Latin America particularly—were observing corporatist systems under nondemocratic regimes. In these nondemocratic polities, corporatism tended more toward a means of political control than a means of building consensus. That is, these corporatist arrangements were designed more to co-opt potentially disruptive political actors than to provide a forum for policy discussion and debate. In authoritarian Mexico, for example, labor and peasant groups engaged the state through peak associations that were heavily subsidized by the government. By creating this system of corporatist intermediation, the Mexican government could co-opt and control powerful social actors that had been influential in the early years of the Mexican Revolution. Brazil in the 1930s and Argentina in the 1940s also developed corporatist systems.

Though the early 1990s witnessed some debate over the possibility of new corporatist arrangements in the post-Soviet bloc, corporatism is no longer as frequently invoked as it was in earlier decades—due in large part to the current dominance of pluralist political and economic models of governance. Nonetheless, corporatism remains a viable alternative form of interest intermediation, should pluralist models of interest intermediation meet significant challenges.

CORRESPONDENCE TESTS

Correspondence testing is a field-experimental technique used to investigate discrimination in hiring in the labor market.

THE EXPERIMENTAL PROCEDURE

Two carefully matched, fictitious applications are forwarded in response to advertised job vacancies. To avoid detection the applications cannot be identical, but the logic of the technique is to control strictly for all objective factors, such as education, qualifications, and experience, that influence job performance. Consequently, the only distinguishing feature of the two applications is the characteristic—such as race or sex—that is being tested for, with race or sex being identified by the name of the applicant. To safeguard against the possibility that letter style may influence employer response, the letters are regularly reversed and allocated equally between the candidates. In this way, the influence of race, or sex, on selection for interview is isolated.

HISTORY

The social scientists who innovated this technique were Roger Jowell and Patricia Prescott-Clarke. In a test of racial discrimination in England in 1969 they matched applicants with Anglo-Saxon names (John/Mary Robinson) against those with “West Indian” (Errol/Eva Gardiner) and Indian names (Santokh Singh and Ranwi Kaur). The test was at a time when most adult Indians and West Indians in Britain were first-generation immigrants, so that their
race was also identified by their primary schooling having occurred in their country of origin, and by specification of their date of arrival in Britain. Applicants with an Anglo-Saxon name were found to be twice as likely to receive an invitation to interview as applicants with an Indian name. No significant discrimination was detected against applicants who were immigrants from the West Indies.

The first economists to use this technique to test for sexual discrimination were Peter Riach and Judith Rich, who applied the test to seven occupations in Melbourne in the 1980s. They found that men were invited to interview 13 percent more frequently than women in the occupation of computer analyst programmer, and 23 percent more frequently than women in the occupation of gardener. No significant discrimination was detected in the other five occupations. Riach and Rich also tested for racial discrimination in Melbourne in the 1980s, matching an Anglo-Celtic name (Baker) against a Greek name (Papadopoulos) and a Vietnamese name (Nguyen). They found that the Anglo-Celtic applicant was invited to interview 10 percent more frequently than the Greek applicant and 41 percent more frequently than the Vietnamese applicant.

Frank Bovenkerk investigated discrimination against Antilleans in France in the 1970s and found that an applicant with a French name was more than three times as likely to be invited to interview as an applicant with an Antillean name. In the 1990s Bovenkerk, in the Netherlands, found that applicants with Dutch names were 23 percent more likely to be invited to interview than those with Surinamese names and 17 percent more likely to be interviewed than those with Moroccan names.

Doris Weichselbaumer, in Austria, matched a man against a “feminine woman” and a “masculine woman,” in two sex-integrated occupations, one female-dominated and one male-dominated occupation. She was able to do this because job applications in Austria include the applicant’s photograph. She found that both types of women encountered some discrimination in the male-dominated occupation, that there was no significant difference in the treatment of the two female types, and that both types of women were more than twice as likely as men to be invited to interview in the female-dominated occupation of secretary.

E. Fry in 1986, and Pauline Graham, Antoinette Jordan, and Brian Lamb in a 1992 follow-up, tested discrimination against applicants with the disability of cerebral palsy, which confined them to a wheelchair. The occupation tested was secretary, and in both experiments the able-bodied applicant was approximately 60 percent more likely to receive an invitation to interview.

Full details of the above studies can be found in the critical survey article by Riach and Rich (2002).
interview; and, without precedent, that women were preferred to men in two sex-integrated occupations: They were 67 percent more likely to be interviewed as computer analyst programmers and twice as likely to be interviewed as trainee chartered accountants. Riach and Rich also conducted the first correspondence test of age discrimination, matching two English women who had graduated simultaneously, but were different ages—one twenty-one, the other thirty-nine. The younger graduate was two-and-a-half times more likely to be interviewed than the woman of thirty-nine (Riach and Rich, 2006b).

ALTERNATIVES TO CORRESPONDENCE TESTS

One alternative approach is to train members of different racial groups to attend interviews and present themselves as having the same skills and level of motivation. British social scientists first used this approach in the 1960s and hired professional actors for their skill in role-playing. The Urban Institute in Washington subsequently adopted this approach, but eschewed the use of actors. A principal advantage of this personal attendance at interview is that it solves the problem of groups that are difficult to identify by name, such as Afro-Caribbeans and African Americans. A second advantage of this approach is that it tests discrimination at the point of job offer, rather than selection for interview. The disadvantage of this personal approach is that you do not have, and cannot demonstrate, the same strict control as exists with correspondence testing. Regardless of the level of training, it is always possible that candidates will present themselves in ways that highlight differences in personality and levels of motivation. This point was made by Robin Ward in the 1960s and again by James Heckman in the 1990s (full details are to be found in Riach and Rich 2002). Heckman has recommended that the candidates should be kept ignorant of the fact that they are operating in pairs and testing for employment discrimination. Ian Ayres did exactly this in a test of racial and sexual discrimination in car sales negotiations, but he also conducted equivalent tests in which the testers were aware that they were testing discrimination. He recorded similar results for both sets of tests (see Riach and Rich 2004 for full details).

Surveying employers about employment practices involves the possibility that there will be a discrepancy between what they report and what they actually practice; whereas correspondence testing unequivocally captures practice.

Inferring discrimination from racial or sexual wage differentials that are deemed inconsistent with productivity-determining variables, such as education and experience, begs the question of what the appropriate independent variables should be.

CORRUPTION

Corruption has been a part of human societies since the oldest of times. Corruption, fraud, embezzlement, theft, bribes, and kickbacks are all forms in which people try to increase their income at the cost of others. Beginning in the latter half of the 1990s, an increased recognition of these costs led to many international and nongovernmental organizations demanding that political and business leaders demonstrate high standards of honesty, ethics, and social responsibility. This in turn led to a concerted fight against corruption, money laundering, and black markets around the world as well as to the recognition of the importance of governance.

WHAT IS CORRUPTION?

Although disagreements abound, corruption is most frequently defined as the misuse of public power for personal
Corruption

Corruption, unlike fraud and embezzlement, refers to decisions that politicians and public bureaucrats (public officials for ease of exposition) make based on authority delegated to them by the populace. When these decisions are motivated by personal gains rather than by the public’s interest, other than politicians favoring segments of the population they represent, this is considered corruption. One of the difficulties of identifying corruption is that these self-serving decisions can often be disguised as good public policy.

Corruption exists in two broad forms—although there are many variations within these two categories and often the two will be intertwined with each other. Administrative, or petty, corruption refers to acts of bribery, kickbacks, or grease money, in which public officials extract a payment for implementing an existing decision. In its purest form this type of corruption is an attempt to redistribute rents or profits associated with a decision. When officials accept a bribe for favoring a particular contractor for a public construction project, they are asking the contractor to share profits associated with the contract with them. The main consequence of such an act of corruption is the redistribution of income that in turn will have some influence on resource allocation.

Political, or grand, corruption or “state capture” occurs when political leaders either allocate national budgets or introduce legislation to facilitate projects from which either they themselves or their close associates will benefit. In almost all cases of political corruption the public would not have made the same decision as the political elite if it were in a position to make that decision. The corrupt elite’s profits come either in the form of bribes or from direct stakes in the projects that benefit from the decisions. Examples of corrupt politicians accepting bribes exist in almost every country—industrialized or developing. Also, examples of dictators who have managed to enrich themselves while impoverishing their countries abound: Haiti under François Duvalier (1907–1971), Philippines under Ferdinand Edralin Marcos (1917–1989), Zaire under Mobutu Sese Seko (1930–1997), Nigeria under Kwame Nkrumah (1909–1972), and Uganda under Idi Amin (c. 1925–2003) are just some of the examples. Political corruption leads to the misallocation of a country’s economic resources while redistributing income within that country.

Corruption is difficult to measure, but it exists in all countries. In countries where corruption is not endemic, corrupt acts are carried out under secrecy. In countries where corruption is widespread, corrupt incomes take so many forms that measurement becomes meaningless. The most consistent attempt to measure corruption has been carried out by Transparency International (TI), a Berlin-based nongovernmental organization (NGO). Every year TI surveys business people and experts, and based on their perceptions it provides a rating between 10 (no corruption) and 1 (most corrupt). Of the 158 countries ranked in 2005, Iceland, Finland, and New Zealand were the least corrupt and Turkmenistan, Bangladesh, and Chad were the most corrupt.

WHY DOES CORRUPTION GROW, PERSIST, OR DECLINE?

To understand why corruption exists, it helps to examine why there is less corruption in some—usually industrialized—countries. One can start by recognizing that authority over public-sector budgets and regulatory frameworks comes with the potential for huge personal benefits. Assuming that only a small percentage of a population is pathologically honest, most public officials will be tempted to take advantage of their authority. Their gains, however, come at someone else’s cost. Therefore, those who may lose from corruption want to control and check the powers of public officials. These checks come in the form of well-developed legal, political, and social institutions within the society. As such, the existence or absence of corruption depends on the balance between the powers of public officials against the strengths of institutions and control mechanisms that empower the public.

All countries have laws against corruption. Selection and retention of public officials, at least in democratic societies, will depend on the public officials demonstrating honest behavior. Democratic institutions that allow a fair and wide participation of the public in the selection of public officials create a barrier against the spread of corruption. Offending officials will be identified and punished by the judicial system or at least not reappointed to their positions. A free press accompanied by an independent and honest judiciary forms another barrier that prevents corruption. Institutions and a variety of organizations that represent specific interest groups in a given society will exert influence on public officials if corruption is likely to harm that society. In so far as politicians derive their authority and appointment from their constituencies, these institutions form another line of defense against corruption. Once in power, however, public officials will have means to render these control mechanisms less effective. A dictator usually succeeds in rendering them completely ineffective; hence, dictatorial regimes are often more corrupt than democratic ones. Democratic leaders are restricted by the strengths of the institutions in a society that constrains behavior of public officials.

Thus, institutions that play an important role in controlling corruption include a free press, an independent judiciary, and a free and democratic political system that gives full voice to the populace in the political process. Research clearly establishes that the absence of corruption
within countries correlates with the level of development of these institutions. It is noteworthy that ideology does not seem to play a role in the extent of corruption. Daniel Kaufmann divided countries into “leftist” and “non leftist” regimes (1998, p. 140). The correlation between the extent of corruption and the type of regime was zero.

CONSEQUENCES OF CORRUPTION

Corruption—which is an important component of what is now called governance—is extremely inimical to economic growth and development (Jain 2001). It leads to misallocation of resources, distorts labor markets, discourages investments, and alters income distribution. The myth that corruption helps markets by “greasing the wheels of commerce” has been proven false. While it is true that a bribe may speed up one transaction, it creates incentives for more and higher bribes in previously bribe-free activities. In a remarkable study of bribery, Robert Wade (1985) shows that once bribes are introduced, bureaucracies redirect their attention from providing services to the public to maximizing bureaucrats’ illicit incomes.

The most damaging consequence of corruption may be in how it inhibits investment in the economy. Research clearly establishes that countries with high corruption have lower levels of investment and economic growth (World Bank 2001). Corruption, which usually exists in an environment of poor overall governance, makes it difficult for entrepreneurs to invest by increasing the cost of starting a business venture. After investments have been made, corruption creates uncertainty for entrepreneurs because the public officials have an option to extract bribes from the venture should it prove profitable. This option increases entrepreneurs’ risks and lowers their returns.

Corruption also distorts the selection of public-sector projects. Small maintenance projects are more effective in terms of their output, but corrupt officials do not like to spend money on smaller projects because they may be carried out by a larger number of contractors, making it more difficult to extract bribes. Thus, corruption biases investment expenditures from high-output to low-output projects. Construction of “roads that go nowhere,” “bridges that no one crosses,” and unused shells of school buildings that abound in the developing world may have been motivated by bribes, not the needs of the society. In addition, if measured by the extent of bribes as a percent of revenue of a firm, corruption affects small firms more than big ones. Because innovative activities in most economies tend to be taken up by small entrepreneurs, corruption stifles an important source of economic growth. Corruption also discriminates against foreign direct investment because dealing with corrupt officials requires familiarity, which is an advantage that domestic firms may possess.

Corruption affects the labor market by distorting returns for various activities. It distorts the allocation of talent between power-seeking activities and other productive activities in an economy. Furthermore, as noted earlier, corruption discourages the allocation of talent to entrepreneurial activities by lowering rewards and increasing risks.

Corruption does not affect all members of a society equally. The poor suffer relatively more from corruption in two ways. First, bribe payments may represent a higher percentage of their income than similar payments by the rich. In this sense, corruption acts as a regressive tax—lower-income households carry a larger burden than higher-income ones. Second, corruption causes the delivery of public services, for example, health care and education, to deteriorate. Such a deterioration affects the poor more than the rich first, because they may have to pay a bribe to receive the services and second, because they depend more on such services. Corruption may also allow the rich to pay fewer taxes than required by law. This lowers the revenues of the state, further deteriorating the ability of the state to provide services for the poor. Studies confirm that corruption causes income distribution to worsen.

FIGHTING CORRUPTION

Recognizing that corruption is a serious obstacle to fighting poverty, many international and nongovernmental organizations since the latter half of the 1990s have been leading the fight to reduce corruption around the world. This fight focuses on three areas: civil societies in which the public plays a key role, a top-down commitment from the political leadership to fight corruption, and a proactive private sector that accepts its social responsibility to operate in a corruption-free manner. Countries that belong to the Organization for Economic Cooperation and Development have accepted their responsibility in this fight by passing antibribery laws that prohibit their firms from paying bribes in other countries. These laws, however, are rarely strictly enforced.

It is difficult to assess the impact of global efforts to fight corruption. Stories of success tend to be anecdotal. If the ratings of TI are any indication, it will take several years before this fight has a significant impact on the extent of corruption around the world.

CORTÉS, HERNÁN
1485–1547

Hernán Cortés is best known as commander of the Spanish conquest of Mexico. His life reveals the human, political, and intellectual dimensions of Spain’s American empire and the use of history in shaping an understanding of this collective enterprise.

CHILDHOOD, EDUCATION, AND EARLY EXPERIENCE

As commonly occurs in the biographies of self-made heroes, the few facts of Cortés’s youth have been supplanted by speculation to invent the lineage, training, and experience that befitted so-called singular men of the Renaissance.

Cortés was born in 1485 in Medellín, a small town beside the Guadiana River in Extremadura. His parents were poor hidalgos (members of the lower nobility), for whom biographers would claim illustrious ancestors, celebrated for heroism and learning. At fourteen, Cortés was sent to learn Latin with the husband of his father’s half-sister in Salamanca. These preparatory studies have been misconstrued and, since 1875, when Bartolomé de las Casas’s History of the Indies (c. 1560) was published, others have repeated his belief that Cortés held a bachelor’s degree in law from the University of Salamanca. These preparatory studies have been misconstrued and, since 1875, when Bartolomé de las Casas’s History of the Indies (c. 1560) was published, others have repeated his belief that Cortés held a bachelor’s degree in law from the University of Salamanca. However, Cortés returned home after two years, for which the decisive event in his education was instead an apprenticeship with an escribano (notary) in Valladolid, from whom he learned the skills used in the Caribbean and later in his own letters, reports, edicts, and briefs.

Cortés departed Spain in 1504, landing in Hispaniola, the administrative center of Spain’s colony and only permanent settlement until 1507. He received a small encomienda (grant of land with the right to native labor) from the governor Nicolás de Ovando and was made notary of the newly founded town of Azua, in the south of the island, an area subdued with his aid. Because an abscess in his thigh (perhaps syphilis) left Cortés unable to join the ill-fated 1509 expedition of Alonso de Hojeda and Diego de Nicuesa to Darién and Veragua, he remained in Azua until 1511, when he enrolled in the conquest of Cuba, serving its leader, Diego Velázquez, as secretary more than as soldier.

Cortés’s years as notary had earned him allies and taught him the workings of the colony at a key juncture in its existence. In 1509, Christopher Columbus’s son, Diego Colón, had replaced Ovando as governor, spurring the settlement of neighboring islands. Justifiably wary of Colón’s ambitions, the royal treasurer Miguel de Pasamonte would recruit Cortés to report on the conquest of Cuba, a service that Cortés capably performed without alienating Velázquez. Despite such oversight, demands for exploration grew over the next years due to the influx of settlers and the precipitous decline of Hispaniola’s native population. The conquests of Puerto Rico (1508), the Bahamas and Jamaica (1509), and Cuba (1511) only temporarily relieved this labor shortage, and did even less to satisfy the ambitions of colonists from Europe.

This state of affairs was further complicated by the protections ceded to the Amerindians under the Laws of Burgos of 1512, the recall of Colón to Spain in 1514, and the death in 1516 of Ferdinand II of Aragon, who had ruled Castile and its overseas possessions as regent after Isabel I died in 1504. Amid uncertainty and competing claims to legitimate and effective authority, the governor of Cuba, Diego Velázquez, sought to steal a march on potential rivals by organizing an expedition to the uncharted lands southwest of Cuba, about which there had been reports as early as 1506, and especially since the voyage of Vasco Núñez de Balboa in 1511. To this end, a small fleet embarked under Francisco Hernández de Córdoba in 1517 and, when this group reported finding a rich land (the Yucatán peninsula) with an advanced, urban population (the Maya), another flotilla was sent under Juan de Grijalva in 1518. Although this expedition met armed resistance, this was seen as a sign of social and political order, a conclusion reinforced by the artisanship of the items obtained in trade and by stories of a great land called México. Using this information, brought in advance of Grijalva’s return by a ship bearing the most seriously wounded, Velázquez demanded formal consent to colonize from the Hieronymite friars representing the Crown in Hispaniola, and from the Crown itself in Spain. While awaiting an answer, Velázquez sought to advance his claim to the title of adelantado (military and civil governor of a frontier province) by launching a much larger mission, ostensibly to search for Grijalva who had in fact returned, and also “to investigate and learn the secret” of
any new lands discovered (Documentos cortesianos, vol. 1, p. 55).

It is possible that Velázquez conspired to have this expedition defy his orders not to settle these new lands, in that Las Casas reported that he later reprimanded Grijalva “because he had not broken his instruction” in this regard (Las Casas 1965, vol. 3, p. 220). In any event, Velázquez did not anticipate the disobedience to be shown by Cortés, whom he made his captain. Velázquez’s motives in naming Cortés remain unclear; for although Cortés had served Velázquez and was able to commit resources, he was an independent spirit; although liked and respected, he was not known as a soldier. The difficulty of hiding Grijalva’s return and the uncertainty of Cortés’s loyalties together explain the haste of the latter’s departure, which occurred on February 18, 1519, with six hundred soldiers and sailors in total.

**CORTÉS AND THE CONQUEST OF MEXICO**

From the expedition’s start, there were tensions between hidalgos with holdings in Cuba, loyal to Velázquez, and others hoping to improve their lot by backing Cortés. The voyage along the coast of the present-day states of Yucatán, Campeche, and Tabasco confirmed these lands’ civilization and wealth, and provided an essential means for their eventual conquest: a shipwrecked Spaniard held captive by the Maya, Gerónimo de Aguilar, and a Nahuatl-speaking native woman enslaved in Tabasco, Malinche (Malintzin or Marina). Translating in tandem and later independently, they enabled the Spaniards to communicate and gather intelligence.

A key fact learned was that many of the peoples subject to the Mexica (Nahua or Aztec) deeply resented the tribute imposed upon them, and that others such as the city-state of Tlaxcala were at war. Cortés would astutely exploit these ethnic and regional divisions, which persisted under Spanish rule, but first he needed to free himself and his troops of the commission received from Velázquez so they might lay claim to the profit of their endeavor. To this end, he arranged to found the settlement of Villa Rica de la Vera Cruz and had its cabildo (town council) review the legitimacy of Velázquez’s orders. The report sent to Spain with an impressive cargo of booty on July 10, 1519, was signed by this cabildo, yet bears Cortés’s imprimatur in its style and content. Depicting Velázquez as a self-serving tyrant, it states that the collective will of the Crown’s subjects residing in the land was to assist their nation and faith by settling there, so they might lead its people from abhorrent rites to Christian religion. For this, the settlers would answer only to the Crown and had implored Cortés to be their captain. It would not suit Cortés to relate these actions, in which he is said not to rebel but to acquiesce to the legitimate demands of his fellow subjects; it is unlikely that Cortés sent a letter of his own, as he and others have claimed.

Stripping and scuttling his ships so that no one could turn back and sailors might become soldiers, Cortés headed inland toward the Mexican capital of Tenochtitlán with approximately 15 horsemen, 400 foot soldiers, and more than 1,300 Totonac Indians. Claiming to be either an ally or foe of the Mexica in accordance with the loyalties of those encountered, Cortés made his way first to Tlaxcala, and then to Cholula, negotiating an alliance with the former after a series of skirmishes, and defeating the latter in part with intelligence obtained through Malinche, who warned that the Cholulans had prepared an ambush, despite protestations of friendship. Here as later, Cortés used exemplary punishment to make known the cost of treason, executing several thousand Cholulans as a warning to others. Though effective, this act was condemned in later years by political rivals and critics.

On November 8, 1519, the Spaniards were received by Montezuma II in the city of Tenochtitlán. Although impressed by the splendor of the city and Montezuma’s control of such a vast and diverse empire, Cortés was concerned by what might happen to his forces, amassed on an island in a lake, should this control falter, as indeed came to pass. For when he left to meet the challenge posed to his authority by an armada sent by Velázquez, hostilities broke out, so that by Cortés’s return on June 24, 1520, the fighting was such that Montezuma himself, held prisoner by the Spaniards, could not quell it. Accounts of these events and of Montezuma’s death a few days later differ, with blame assigned either to the greed of the Spaniards, who allegedly ordered a celebration held in the main temple to slaughter the Mexican warriors, or to the treachery of the Mexica, who allegedly used this event to arm an attack. In any event, the Spaniards were obliged to flee Tenochtitlán during the night of June 30 (la noche triste), losing more than half their forces and nearly all the plunder. These losses fell heaviest on the troops newly recruited, with promises and threats, from among the men sent to arrest Cortés by Velázquez.

Escaping with further casualties to Tlaxcala—which would be accorded special privileges for its partly self-interested loyalty: tax exemptions, the right of its citizens to ride horses and use the honorific title Don—Cortés understood that retreat to the coast and on to Cuba or Hispaniola was impossible given the doubtful legality of his status as Captain General of the Spanish forces, which, although Cortés did not know it, Charles V had pointedly left unaddressed after receiving the cabildo’s letter and delegates. Cortés therefore began plans to retake Tenochtitlán, rallied his allies and troops (which, after the rout suffered on la noche triste, included the most resolute and
battle-hardened of those previously in his command), and wrote to the king on October 30, 1520, assuring success while blaming defeat on Velázquez’s meddling, which, he said, had diverted his energies at a crucial moment, undermining his command over the Spaniards and his stature in the eyes of the Mexica.

This letter is key to an understanding of the conquest as a whole. Although it was designed to bolster Cortés’s claim to leadership—for example, by recasting fortuitous events as evidence of his foresight and God’s favor, or by narrating successful actions in the first-person singular—it also brings to light differences between the mainly political tactics of the first march to Tenochtitlán and the violent means ultimately used in its military conquest. The picture put forth in this letter of an enemy seemingly bewildered by technology (ships, firearms, and iron weapons), horses, psychological warfare, and Cortés’s ability to anticipate Montezuma’s every move and moreover use rhetoric and his own irrational beliefs against him—notably the idea that the Spaniards had been sent by the god Quetzalcoatl, an idea that would in fact become current only after conquest as justification for defeat—has led to the assumption of cultural superiority. Furthermore, it has prompted neglect of the difficulties encountered by the Spaniards after their initial entry into Tenochtitlán and especially after la noche triste. The introduction of diseases such as smallpox to which the Amerindians lacked immunity certainly affected the two sides equally.

The advantages cited by Cortés in his report to the king might have been decisive had the conquest been rapid; but, as it endured, the Mexica were able to devise countermeasures. Even as Cortés ordered thirteen brigantines built to ferry troops and attack Tenochtitlán from the water, where its defenses were most vulnerable, the Mexica were digging trenches armed with sharply pointed sticks and captured lances to kill or hobble the Spaniards’ horses. So too would the Mexica make a display of sacrificing and cannibalizing the Spaniards taken in battle to terrorize their comrades as the latter had before used firearms, horses, and dogs to terrorize them. The resulting pursuit of captives for sacrifice would prove costly for the Mexica insofar as it allowed Cortés and others in his company to escape death on several occasions. For this and the far larger number of Mexican combatants—despite the welcome arrival of reinforcements while in Tlaxcala, Cortés reports that in the final assault on Tenochtitlán his forces comprised barely 700 infantry, 118 musketeers and crossbowmen, 86 horsemen, 3 canon, 15 field guns, and an unspecified number of native fighters and bearers, apparently fewer than had supported him on his previous entry—Cortés was obliged to abandon his intent to take the city without destruction.

Despite more than two months of siege, beginning on May 30, 1521, the Mexica, though visibly starving, refused to surrender, prompting the Spaniards to raze the city sector by sector to maximize the effect of canon and to deprive the Mexica of cover for attack. Dismayed by the devastation of these final days and their aftermath, during which little was or could be done to restrain the Tlaxcalan forces, Cortés would remark in his third letter to the Crown (May 15, 1522): “So loud was the wailing of the women and children that there was not one man amongst us whose heart did not bleed at the sound; and indeed we had more trouble in preventing our allies from killing with such cruelty than we had in fighting the enemy. For no race, however savage, has ever practiced such fierce and unnatural cruelty as the natives of these parts” (Cortés 1986, pp. 261–262). On August 13, 1521, Tenochtitlán and its new leader, Cuauhtémoc, surrendered.

CORTÉS’S LEGACY
Although Cortés reorganized and governed the conquered territory, renamed New Spain, until 1528, and led another, this time disastrous, expedition to Honduras (1524–1526), his final years, until his death in 1547, were spent in relative obscurity. His actions in exploring the Pacific coast northward in search of the legendary riches of Cíbola (1532–1536) and in support of Charles V in the unsuccessful assault on Algiers (1541) show a man broken in spirit. It is telling that writers of the sixteenth and seventeenth centuries celebrate Cortés’s role, not as military commander, but as an instrument of God, delivering the New World from idolatry and extending the rule of Catholic faith in opposition to Martin Luther, who they wrongly said was born in the same year. Although this image has faded from modern accounts, replaced by that of Machiavelli’s ruthless prince, the audacity of Cortés’s exploits has not. For this and the power of his discourse, Cortés’s letters to the Crown are required reading for scholars of Renaissance society.

Cosmopolitanism

Cosmopolitanism is a term derived from the Greek word kosmopolite ("citizen of the world"). It emerged as a philosophical and ultimately cultural worldview during the Hellenistic period, when thinkers traced the conceptual evolution of the people’s mentalité from that of the citizen of the city-state to that of the citizen of the entire ecumene (or extended Hellenic world). After a long eclipse, the concept reemerged in the writings of Kant, where the future evolution of the world into a cosmopolitan society was originally contemplated. Adam Smith should also receive credit, however, for his endorsement of free trade as a cosmopolitan stance. In the nineteenth century, the word gained a negative connotation through its juxtaposition with the popular idea of nationalism, a trend that reached its peak in the word’s employment as a derogatory term by the Nazis.

Although cosmopolitanism reemerged as a potentially powerful concept in the late 1990s, it is important to note that the concept continues to lack a universally shared definition. It has been applied to philosophical and normative orientations as well as to political and cultural attributes, and its employment in the discourse of different disciplines is far from uniform. Moreover, cosmopolitanism has been related both to efforts to construct forms of transnational solidarity, and to the various urban cultures of past and present metropolitan centers. Perhaps the most important contributions to the literature on cosmopolitanism can be found in the writings of Ulrich Beck, and in work inquiring into the possibility of cosmopolitanism providing the foundation for a future European identity.

Generally speaking, contributors to the growing literature on cosmopolitanism interpret the term in a threefold manner. Some authors advocate “thin” cosmopolitanism, whereby cosmopolitanism is conceived as a form of detachment from local ties, whereas others argue in favor of “rooted” or context-specific or vernacular cosmopolitanism, whereby cosmopolitanism is conceived as congruent with locality. Finally, some suggest the existence of “glocalized” cosmopolitanism, whereby global detachment and local attachment coexist in a symbiotic relationship. Thus, depending upon the particular definition employed, specific groups of people can be conceived either as carriers of cosmopolitanism or as excluded from it altogether. For example, immigrant groups have been viewed as carriers of vernacular cosmopolitanism, but they are almost by definition excluded from some versions of “thin” cosmopolitanism.

In contrast to the growing body of theoretical work on cosmopolitanism, there is to date only a limited amount of empirical research in the literature. Ultimately, only empirical research will be in a position to determine which one of the different theoretical strands of cosmopolitanism might be the most promising one for sociology. Such work might also help to evaluate whether the world is indeed experiencing a trend toward cosmopolitanism, and might identify which attributes are observable among the public and the extent to which these are related to other trends—such as the growth of transnational connections or a revived sense of religiosity.

COST-BENEFIT ANALYSIS

The process of cost-benefit analysis, or CBA, enables analysts to exploit a set of analytical economic and econometric tools to evaluate project investments and policy options. It has been made a legal prerequisite for public policy decisions in most countries. In the United States, for example, Executive Order 12991, signed by President Ronald Reagan in 1981, codified CBA as a requirement for agencies when conducting risk assessments in health, safety, and environmental regulation.

There is a large body of literature available dealing with CBA, some of which dates back to the 1920s, when large-scale engineering projects in the United States required some type of project evaluation. Although CBA is not itself a self-contained field of economics—sitting somewhat uneasily between several scholarly discourses, including philosophy, psychology, and politics—the central procedures of CBA have been predominantly defined by economists. The standard introductory textbook was written by an economist, Edward J. Mishan. Originally published in 1971, the fourth edition of Mishan’s Cost-Benefit Analysis appeared in 1988. While the original purpose of CBA was to capture the costs and benefits accruing to a single enterprise, its scope was soon expanded to evaluate policy options applicable to the well-being of society as a whole, and most literature in the social sciences now refers to CBA in this context.

A cost-benefit analysis can be seen as proceeding through a number of stages. First, for any proposal under consideration, including the option of doing nothing, a qualitative statement of its expected costs and benefits is to be provided. Second, each cost and benefit should be rendered in quantitative form, usually as a monetary value. Third, the expected costs or benefits should be aggregated. Finally, a decision should be taken on the basis of which proposal produces the greatest sum of benefits over costs. The first stage seems essential to any rational decision-making process, but each further stage is highly contested on conceptual, economic, and philosophical grounds. Three issue areas in particular are worth pointing out: (1) monetary valuation, (2) aggregation, and (3) the subordination of other values.

MONETARY VALUATION

In order for CBA not to be arbitrary or fetishistic, some connection between the currency of the economic analysis and human well-being must be established. The monetary value of goods is usually chosen for this purpose, because it is said to reflect the strength of individuals’ preferences for that good, which in turn is a measure of the well-being provided by it. Yet various objections have been raised regarding this approach. First, some goods and services—such as most ecosystem services—are not traded in markets at all, and therefore no monetary value can be ascertained. The social sciences have developed various surrogate methods to rectify this deficiency, and “contingent valuation” (CV) has been particularly influential. Through CV, economists seek to create hypothetical markets by eliciting people’s “willingness to pay” (WTP) for the satisfaction of a preference if there was a market. However, WTP has been criticized as an inadequate proxy for market prices because of the ambiguity and limited reliability of the stated preferences used in CV (as opposed to those revealed in the market). There is also some doubt as to whether coherent preferences on policy issues are actually susceptible to valuation and extractable through interviews or questionnaires.

Second, preferences conceal well-known facts about human nature, and they are therefore not always a suitable basis for policy decisions. For example, individuals may adjust their aspirations to their perceptions of possibilities; preferences may be misinformed or malformed, and they may therefore cause individuals to inflict harm on themselves (e.g., the addict; the gambler) or on others (e.g., the murderer); and preference satisfaction fails to accord the proper moral status to those beings that are incapable of expressing a preference—whether human (e.g., children) or nonhuman (e.g., animals).

Finally, where monetary valuation in a market is possible, that value may not be a valid indicator of the well-being the good provides to society because of the conceptual difference between a good’s monetary “exchange value” and its “use value.” Gold, for example, has a high exchange value but a low value in actual use. The use value of the air we breathe, by contrast, is infinite (it being a physical necessity for our lives), while its exchange value is zero.

AGGREGATION

Once attributes of well-being have been valued, CBA requires that they be aggregated into a single standard. They need to be compared across lives, so that an increase in well-being for individual A in one dimension can be weighed against the foregone improvement individual B would have experienced in another. This is no easy task. It may be possible to make comparisons of well-being in an ordinal sense—in the case of, say, health care, one person may be able to stipulate that he or she feels better than someone who is in great physical pain—but not in a cardinal sense. That is to say, a person cannot know exactly how much better he or she is. Cardinality presupposes two characteristics of the currency used: (1) a number must be attached to the outcome that represents the strength of the preference relative to others, so that a health state of, say,
0.6 is three times better than one of 0.2; and (2) the scale must have an equal interval property where equal differences at different points along the scale are equally meaningful, so that boosting a patient from, say, 0.1 to 0.2 on that scale is of equal benefit to raising someone from 0.8 to 0.9. Despite various methodological advancements, these requirements are still not met for all CBAs.

THE SUBORDINATION OF OTHER VALUES

Finally, CBA imposes a unitary standard on the valuation and comparison of goods, and it thus subordinates other values to the new standard of monetary exchange value. In environmental CBAs, for example, the existence value of nonhuman species, the survival of which is deemed to be worth protecting, may be overridden by CBA calculations. Their value cannot be priced in real or hypothetical markets because the expected benefit of their survival does not accrue to those who might be asked to reveal or state a WTP for their preference.

As far as human beings are concerned, similar predicaments present themselves: is it permissible to kill one person because his organs could save the lives of four patients whose names are on a donor waiting list? Most of us would consider this option to be objectionable, but given the rationale of CBA it is justifiable, if not mandatory, to proceed that way. The problem encountered here is that with CBA every individual counts as one, and can thus be added up to, or traded against, someone else. In so doing, CBA will override the intrinsic value of human life, a term that denotes our interest in our own continued existence according to which we cannot be used solely as a means for other individuals’ ends. Yet, this is what CBA would recommend us to do. Intrinsic values are nonrelational; that is, they are not defined relative to some other human being, species, or object, nor to the benefit it might provide to them.

The objections presented here are not a reason to reject CBA per se, for it does provide relevant information. Yet they are a reminder that economic evaluations such as CBA should be understood as an input into, rather than a substitute for, political deliberation and judgment.

COTTON INDUSTRY

Gossypium—the scientific term referring to the genus of cotton plants—belongs to the small tribe of Gossypieae, which, in turn, is part of the Malvaceae family. Four separate species of cotton—two in Asia-Africa (G. arboreum and G. herbaceum) and two in the Americas (G. barbadense and G. hirsutum)—have been domesticated independently, a process that is unusual among crop plants. While the geographical point of origin of G. arboreum is not known, the origin of G. herbaceum is the Arabian peninsula or Africa. The exact time and place of domestication of the Old World cottons is not clear but archeological remains recovered from sites in India and Pakistan indicate that domestication of G. arboreum took place about 4,300 years ago. Furthermore, because G. arboreum is agronomically superior to G. herbaceum, it was widely dispersed throughout northern Africa, Arabia, Iraq, and western India. With respect to the New World cottons, the earlier archeological remains of G. barbadense have been located in the coastal areas of Peru and Ecuador, dating 5,000 to 5,500 years ago. The primary route of dispersal appears to have been through the Andes into northeastern South America and later to Central America, the Caribbean, and the Pacific.

The oldest archeological remains of G. hirsutum have been located in the Tehuacan Valley of Mexico, dated from 4,000 to 5,000 years ago. The vast majority of cotton varieties used for lint production in the 2000s come either from G. hirsutum (referred to as upland cotton in the United States and middling elsewhere, accounting for 90% of global production) or from G. barbadense (referred to as long-staple cotton or Pima in the United States and Giza in Egypt, accounting for 10% of global production). The Asian-African species produce low-quality lint with low yields and have been mostly (but not entirely) abandoned. The oldest archeological record of cotton textiles was found in Pakistan and dates back to 3000 BCE. Cotton specimens have been located in northern Peru, dating as far back as 2500 BCE.
Trade of cotton goods was taking place between India and Persia as early as the fifth century BCE. Cotton was brought to southern Europe (Greece, Sicily, and Spain) on a large scale by Arab traders during the ninth and tenth centuries CE while it was imported to North Europe during the thirteenth century. The known history of cotton in the New World begins with the arrival of Spanish explorer Christopher Columbus (1451–1506) in the Bahamas Islands in the autumn of 1492 (see John Baffes's article “The History of Cotton Trade: From Origin to the Nineteenth Century” [2005] for a comprehensive history of the cotton trade).

Considerable growth in cotton production and trade took place toward the end of the eighteenth century. Several factors contributed to such growth. First, advances in industrial revolution lowered the costs of manufacturing textile products. For example, between 1786 and 1882, the labor and capital cost of producing one pound of yarn went from thirty-four shillings to one shilling. Second, the use of cheap slave labor in the United States lowered the costs of cotton picking (cotton along with sugar and tobacco are often referred to as the slave commodities). Prior to the U.S. Civil War, about one-third of U.S. slaves were employed in cotton fields. (In 1897 Mathew Hammond reported that of the 3.5 million slaves in 1840, at least 1.2 million were engaged in the U.S. cotton industry). Third, the invention of the saw gin by Eli Whitney in 1793, which changed the separation of lint and seed from a laborious to a simple mechanical process, freed labor that eventually became involved in cotton production (seed cotton consists of about one-third lint and two-thirds seed; the two byproducts of seed are cotton oil for human consumption and cotton meal for animal consumption).

Cotton trade was further enhanced with the arrival of the first steamer in New York in 1838, which effectively halved the time to cross the Atlantic. Because the steamers would bring information on the U.S. cotton market conditions to England in half the time compared to the actual delivery of cotton, cotton traders in Liverpool, England’s dominant cotton trading center at the time, began to trade forward contracts, thus giving rise to speculation. Furthermore, the successful installation of the first transatlantic cable in 1865 would transform cotton trade in a permanent way. For the first time in history, information on market conditions in the U.S. was transmitted instantaneously to England and vice-versa. By the end of the 1880s, five cotton futures exchanges (New York, New Orleans, Liverpool, Le Havre, and Alexandria) spanning three continents were trading cotton futures contracts and were connected by cable.

The global cotton industry was also affected by the U.S. Civil War, which caused exports from the United States to decline to a few thousand tons, from half a million prior to the war. Cotton prices experienced the most dramatic rise in the history of the commodity to cause what was coined later the “cotton famine.” England, whose textile industry would collapse without U.S. cotton supplies, sought supplies from elsewhere including Turkey, India, Central Asia, and sub-Saharan Africa. While the United States regained its dominance as the world’s key cotton supplier after the war, the other cotton-producing countries also held their position. The structure of cotton production has remained the same in the twenty-first century. However, throughout the twentieth century, especially the second half, cotton consumption moved from Europe to Asia where the most of the textile industry is located and where most of the synthetic fiber production takes place.

**THE MODERN COTTON INDUSTRY**

Global cotton production at the beginning of the twenty-first century averaged about 25 million tons, worth about $30 billion. About one-third is internationally traded, representing about 0.1 percent of global merchandise trade. Despite its low share in global trade, cotton trade is very important to many poor countries, especially in sub-Saharan Africa where an estimated 2 million rural poor households depend on the commodity.

Since the 1960s cotton production grew at 1.8 percent annually to reach 24 million tons in 2005 from 10.2 million tons in 1960. Most of this growth came from China and India and to a lesser extent from Australia, Greece, Pakistan, Turkey, and Francophone Africa. As of 2005 more than one-quarter of the area allocated to cotton was under genetically modified (GM) varieties, accounting for almost 40 percent of world production. GM cotton in the United States—where it was first introduced in 1996—currently accounts for about 80 percent of the area allocated to cotton. Other major GM cotton producers are Argentina, Australia, China, Colombia, India, Mexico, and South Africa.

China, the leading textile producer, consumes more than one-third of cotton output. Other major textile producers are India, Pakistan, Turkey, and the United States, which together with China account for more than three-quarters of global consumption. Several East Asian countries have emerged as important cotton consumers. For example, Indonesia, Korea, Taiwan, and Thailand, which together consumed 130,000 tons in 1960 (1.2% of world consumption), absorbed more than 1.5 million tons in 2005 (6.5% of world consumption).

Between 1960 and 2005, cotton demand has grown at the same rate as population (about 1.8% per annum) implying that per capita cotton consumption has remained relatively unchanged at about 7.7 pounds. By
contrast, consumption of man-made fibers, which compete closely with cotton, has increased consistently since the mid-twentieth century by 2.2 percent per annum, causing cotton’s share in total fiber consumption to decline from 60 percent in 1960 to 40 percent in 2002. Apart from the substantial reduction in their costs of production, the increasing share of chemical fibers reflects new uses, quality improvements which made their properties very similar to those of cotton, increased use for clothing suitable to extreme weather conditions (e.g., rain, cold) and other uses such as sportswear.

The three dominant exporters—the United States, Central Asia, and Francophone Africa—account for more than two-thirds of global trade. In the mid-2000s the ten largest importers account for more than 70 percent of global trade. Three major producers—China, Turkey, and Pakistan—also import cotton to supply their textile industries. The four East Asian textile producers—Indonesia, Thailand, Taiwan, and Korea—accounted for 22 percent of world cotton imports in 2002, compared to just 3 percent in 1960.

Real cotton prices have been declining since the nineteenth century, although with temporary spikes. The reasons for such decline are similar to those characterizing most primary commodities: on the supply side reduced production costs due to technological improvements and on the demand side stagnant per capita consumption and competition from manmade fibers. Between 1960 and 1964 and between 1999 and 2003 real cotton prices fell by 55 percent, remarkably similar to the 50 percent decline in the broad agriculture price index. Reductions in the costs of production have been associated primarily with yields increases (from 270 pounds per acre in 1960 to 625 pounds per acre in 2005). The phenomenal growth in yield has been aided by the introduction of improved cotton varieties, expansion of irrigation and use of chemicals and fertilizers. Technological improvements have also taken place in the textile industry, so that the same quality of fabric can now be produced with lower quality cotton, a trend that has taken place in many other industries whose main input is a primary commodity.

World cotton trade is carried out by a large number of cotton trading companies—the so-called cotton merchants. A survey conducted in 2005 by the International Cotton Advisory Committee (ICAC) found that 21 large companies (either private or state-owned) traded cotton during 2004 with volumes greater than 200,000 tons. Another 48 companies traded cotton with volumes between 50,000 and 200,000 tons, followed by 43 firms with volumes between 20,000 and 50,000 tons and another 362 smaller companies with volumes less than 20,000 tons.

There are two widely used price indicators in the cotton market: the Cotlook A Index and the New York Board of Trade (NYBOT) futures price. The A Index—compiled daily by Cotlook Ltd., a private company located in Liverpool, United Kingdom—is the average of the five lowest quotations of nineteen types of cotton traded in the ports of East Asia. Quotations of NYBOT futures are readily available continuously from the NYBOT. Apart from NYBOT, whose contract exhibits high liquidity, Brazil, India, and China operate cotton futures exchanges.

**COTTON POLICIES**

Cotton has been subject to various marketing and trade interventions; typically taxation in low income countries, especially sub-Saharan Africa and Central Asia, and subsidization by rich countries, especially the United States and the European Union (EU). The ICAC, which monitors cotton subsidies on a regular basis, reported that in 2001—the year in which support was highest—government assistance to U.S. cotton producers reached $3.9 billion, China’s totaled $1.2 billion, and the EU received almost $1 billion. The high level of cotton subsidies also coincided with cotton prices reaching their lowest level ever, causing two noteworthy reactions, the Brazil/U.S. cotton dispute brought to the World Trade Organization (WTO) in 2002 and the Francophone Africa cotton initiative submitted also to the WTO in 2003.

On September 27, 2002, Brazil requested consultation with the United States regarding U.S. subsidies to cotton producers. On March 18, 2003, the Dispute Settlement Body of the WTO established a panel to examine the issues, and on April 26, 2004, the WTO issued an interim ruling in favor of Brazil. The final ruling (issued on September 8, 2004) concluded that the United States is under the obligation to take appropriate steps to remove the adverse effects or withdraw the subsidy. While the United States removed a small share of its subsidies in July 2006, it appears that more must be done in order to fully comply with WTO’s ruling.

On May 16, 2003, four West African cotton-producing countries (Benin, Burkina Faso, Chad, and Mali) submitted a joint proposal to the WTO demanding removal of support to the cotton sector by the United States, China, and the European Union and compensation for damages until full removal of support. The West African countries were aided in this move, often referred to as the “cotton initiative,” by IDEAS, a Geneva-based nongovernmental organization funded by the Swiss government. It is believed that the inability to successfully deal with the cotton initiative played a role in the WTO’s collapse of the Fifth WTO Ministerial in Cancun (September 10–13, 2004). The cotton initiative also fig-
ured prominently in the Sixth WTO Ministerial in Hong Kong (December 13–18, 2005).

THE OUTLOOK
The future of the global cotton industry is likely to follow a similar path as other primary commodities. Prices are likely to decline even further, mainly a reflection of technological improvements. Consumption, which has been growing at the same rate as population growth, will, most likely, continue to grow in a similar fashion. If twenty-first-century trends continue, GM cotton will most likely dominate the global cotton market. Organic cotton, on the other hand, despite concerted efforts has not made much progress. The key reason behind the GM and organic cotton trends is that, because it is not a food crop, there is not much consumer resistance. Finally, the competition from synthetic fibers will continue, although there is evidence that consumers’ preferences have changed toward consuming more cotton.

COUNTERTERRORISM
Many different programs and activities, at all levels of government and in the private sector, help to save lives and property from terrorism and are properly considered as aspects of counterterrorism. The activities that are most commonly and explicitly labeled as counterterrorism are offensive efforts by security services to uncover and erode the capabilities of terrorist groups to conduct attacks. Another major element of counterterrorism—although it sometimes bears the label antiterrorism—is creating defensive security measures to protect possible targets from terrorist attack. Still another is the development of capabilities to respond quickly to terrorist attacks in a way that will mitigate their damaging effects. Less commonly described as counterterrorism are activities that affect the motivations of groups to use terrorism or of individuals to join terrorist groups in the first place, although this last element can have as great an effect as the others on the incidence of terrorism.

OFFENSIVE AND DEFENSIVE TOOLS
Offensive counterterrorism is aimed chiefly at disrupting or destroying the leadership, planning, finances, and organizational structure of terrorist groups. Common techniques include raids to break up terrorist cells, seizure of documents and materials, arrests of key individuals, and rendition of suspected terrorists to countries where they are wanted for interrogation or prosecution. Intelligence, diplomacy, criminal justice, financial controls, and military force are the principal tools that national governments use to weaken the capabilities of terrorist groups. Each tool has its limitations as well as its strengths, and effective counterterrorist programs use all of them in combination.

Intelligence tends to be the most heavily relied upon counterterrorist tool, particularly because of the hope that it will uncover enough specific information about impending terrorist attacks to preempt the attacks. The inherent difficulties in obtaining highly specific information about closely held terrorist plots, however, means some plots will inevitably escape such exposure. Intelligence makes larger contributions to the disruption of terrorist infrastructures and to the strategic assessment
of threats from particular terrorist groups or in particular countries or regions.

Because terrorism always involves the commission of crimes, criminal justice systems play a major counterterrorist role, both in the investigation of past or possible future terrorist attacks and in the prosecution and incarceration of individual terrorists. Limitations of criminal justice systems include the frequent difficulty in obtaining strong enough evidence for a successful prosecution. Closely associated with intelligence and law enforcement work are efforts, usually centered in finance ministries, to seize or freeze financial assets belonging to terrorist groups. A limitation of financial efforts is difficulty in tracking terrorist money that moves through informal channels outside any banking system.

Diplomacy supports the other offensive tools through, for example, demarches to foreign governments to enlist their cooperation in arresting suspected terrorists or in providing information to facilitate counterterrorist investigations. Counterterrorist diplomacy has also assumed more of a multilateral role, particularly since the 1990s. The negotiation of more than a dozen international conventions on terrorism has provided a framework for cooperation on such matters as the handling of hijacking incidents and the tagging of explosives (insertion of a distinctive chemical during manufacture of explosives, permitting investigators to trace the origin of any one batch of explosives).

Military force has been used relatively sparingly for counterterrorist purposes, and mostly by the United States. Its principal role formerly was to retaliate for terrorist acts already committed, as with U.S. retaliatory strikes against Libya in 1986 and Iraq in 1993. The U.S. intervention in Afghanistan in 2001 marked an expanded use of military force in that it served not only to retaliate for Al Qaeda’s attack against the United States in September of that year but also to root out the group from its base of operations and to drive from power its close ally, the Afghan Taliban regime.

Defensive security measures are used to protect individual sites that are potentially attractive to terrorists (e.g., prominent government buildings), systems critical to public safety or the economy (e.g., civil aviation or electric power grids), and national borders. All these areas were included in major efforts, following Al Qaeda’s attack in September 2001, to bolster defenses against terrorism within the United States, efforts that collectively come under the title homeland security. A major challenge is in finding ways to safeguard inherently open, and thus vulnerable, public facilities and systems such as ports and transit lines without resorting to measures that are economically damaging or that unduly impair civil liberties. Another challenge is that terrorists have the offensive side’s advantage of choosing which out of many possible targets to strike.

Incident response capabilities are designed both to limit the physical damage of terrorist attacks and to reassure the public that authorities have emergency situations under control. Counterterrorist response capabilities have focused particularly on the possibility of attacks using chemical, biological, radiological, or nuclear means. With some of these unconventional attack methods, a quick and well-planned response is critical in limiting the effects. An attack using an infectious biological agent, for example, would be less effective insofar as the response included early identification of the agent, isolation of infected persons, and inoculation of other persons in danger of becoming infected.

ORGANIZATIONAL ROLES

Offensive counterterrorist responsibilities exist mainly at the level of national governments, although organizational structures vary. In most developed countries important counterterrorist organizations are domestic security services such as MI-5 in the United Kingdom or the Public Security Investigation Agency in Japan. The United States has no such service; the Federal Bureau of Investigation performs both this role and its criminal law enforcement functions. Intelligence agencies, militaries, and coordinating bodies such as the National Security Council in the United States also play major roles.

Responding to terrorist incidents is more the responsibility of local authorities, with municipal fire or police departments necessarily performing the role of first responders. National resources will often provide augmentation, however, in the event of major terrorist incidents.

Homeland security functions are spread among different levels of government. The biggest organizational innovation was the creation in the United States in 2002 of a Department of Homeland Security, which assumed primary responsibility for border security and the protection of assets such as the civil aviation system. Protection of many individual sites is still at least as much a local responsibility. Moreover, the security of many potential terrorist targets, from power plants to the electronic infrastructure used by financial markets, depends in large part on measures by the private sector.

COUP D’ETAT
Coup d’état is an important, often violent type of political leadership change. Coups involve a small group of conspirators plotting to seize state power and then doing so on their own or with the support of others. Coup attempts are swift, lasting hours or a few days. Often attempts fail, but if state power is taken and held, the event is a coup d’état. Both failed and successful coups may involve many deaths as a result of fighting between the coup participants and loyal armed forces, or they may be bloodless coups in which no one dies. Historically most coups have been military coups involving elements from the state’s own military and police because their firepower is needed to crush any possible opposition. When coups overthrow constitutionally elected governments, they are forceful, illegal means of political change. When coups are against dictatorships they are sudden, unexpected, and irregular means of political change.

The term coup d’état (“blow against the state”) comes from Napoléon Bonaparte’s use of his troops on the 18th Brumaire (November 9, 1799) to overthrow the constitution of the First French Republic and ultimately to place himself in power as emperor. After independence in the early nineteenth century, most Latin American states experienced repeated coups (Los Golpes Militares) led by innumerable caudillos (dictators), a phenomenon lasting until the 1980s. After decolonization, coups d’état occurred in many new states of North Africa, the Middle East, Asia, and Africa. The 48 states of sub-Saharan Africa have seen the most coups, with 40 states experiencing 83 successful and 112 failed coups between 1956 and 2004. While rare in developed countries, coups have occurred in Europe, in Greece in 1967 and in Portugal in 1974. On some occasions coups have brought to power men who tried to better their countries, but generally coups have produced poor political leadership, further impoverishing their countries.

Coup leaders often proclaim themselves “revolutionaries,” but coups are not revolutions. Revolutions involve armed conflict; some coups do not. Revolutions last for months or years, coups last mere hours or days. Revolutions are mass political events involving much of the population; coups are made by a few coup-makers who are often political or military elites. Revolutionaries seek fundamental social, economic, and political change; coup-makers may seek this, but they may act to prevent change or merely to gain the rewards of political office. Revolutions produce profound societal change; coups produce changes in political leadership and often little else.

When countries have weak political institutions—political parties, legislatures, courts, and bureaucracies—they may suffer frequent military interventions into politics. Harvard political scientist Samuel P. Huntington has called such countries praetorian polities. The type of coups they experience and the style of the resulting military rule depend upon the degree of political participation among the population: (1) when participation is low, only among elites, oligarchical coups and rule occur as in Paraguay under Alfredo Stroessner (1954–1989); (2) when participation is moderate, including both elites and the middle classes, radical coups and rule happen as in Egypt under Gamal Abdel Nasser (1956–1970); and (3) when participation is high, including all social classes, the results are mass coups and rule as in Argentina under Juan Domingo Perón (1946–1955). Huntington’s variables, the strength of political institutions, and the level of political participation are key to understanding why and where coups d’état happen.

COVARIANCE
The covariance is a measure of the magnitude of association between the scores of cases on two variables that have been measured at the interval or ratio level. It describes both the direction and the strength of the association. In
the social sciences, the covariance is most commonly used in structural equation modeling of systems of linear equations of measured and unmeasured variables.

Formally, the covariance between the scores of c cases (i through N) on the variables X and Y is:

\[ \text{COV}(X, Y) = \frac{1}{N} \sum_{i=1}^{N} (x_i - \overline{X})(y_i - \overline{Y}) \]

That is: subtract the first case’s score on X from the mean of X; subtract the first case’s score on Y from the mean of Y; multiply these “deviations.” Repeat this process for all of the cases, and sum the results. Divide this product by the population size (N).

When the relationship between X and Y is being examined in a random sample of cases drawn from the population, N – 1 is usually substituted in the denominator. Most statistical software uses N – 1.

The covariance of a variable with itself (e.g., COV (X, X)) is the variance. (For a more in-depth formal treatment of the covariance, see Snedecor and Cochran 1980).

If there is a tendency for higher scores on X to co-occur with higher scores on Y, the covariance will have a positive value; if there is a tendency for higher scores on X to co-occur with lower scores on Y, the covariance will be negative. If the scores on two variables are not associated, the covariance will equal zero. The units of measurement of the covariance are XY; for example, if X was measured in dollars, and Y was measured in years, the magnitude of the covariance would be dollar-years. When we are working with multiple variables, the variances and covariances among all the variables are arrayed in a symmetric “variance-covariance” matrix.

Consider the relationship shown in the scatter-plot, between the level of urbanization (X) and female life expectancy (Y) in nineteen African countries in the mid-1990s. Inspection suggests that the scores positively co-vary: on the average (but not in all cases), the higher the urbanization, the higher the life expectancy.

The covariance for this relationship is 57.538. The positive value indicates a positive relationship. The strength of the relationship is difficult to assess because the unit of measurement of the covariance is percent-years. Because of this peculiar metric, the covariance is rarely used as a simple description. The Pearson correlation (which is .47 in this example) is preferred.

The covariance is the most commonly used measure of association when research involves predicting Y from X using structural equation modeling. In predictive modeling, there is often the desire to describe the relationship between Y and X in the original scales of the variables: How much Y do we get for each unit of X?

Some warnings: Restricted variation in either variable, non-linearity in the relationship, and non-normality in the joint distribution of X and Y can limit the validity of the covariance as an index of the strength and direction of the relationship.

COX, OLIVER C.

1901–1974

Oliver Cromwell Cox was a Caribbean-born sociologist who challenged the social sciences by pointing out problems with scholarly theories that attempted to explain race relations and the social and economic organization of race. Cox’s life itself paralleled the state of race relations during the twentieth century in that his work was for many years overlooked, and he was marginalized both by black and white students of race relations. Yet he made a lasting contribution to the scientific understanding of cultural and sexual relations, as well as the sometimes violent social disorder that develops in the context of race. Unlike earlier scholars, Cox analyzed black-white relations in the United States in terms of race rather than caste, and he criticized what were then the dominant theories for explaining the impact of capitalism on the social system.

Cox was born on August 24, 1901, in Port of Spain, Trinidad. He received his primary school education at the Saint Thomas Boys’ School, where he studied algebra, English literature, French, geometry, Greek, history, and Latin—the normal subjects that young boys were required to study in colonial Trinidad. Growing up in Trinidad, Cox also had to contend with colonial society’s strict adherence to the social norms of decorum and respectability that were associated with colonial bourgeois pretensions. Obsession with skin color was embedded in Trinidadian culture during Cox’s early life. For most black Trinidadians, light-colored skin was thought to be more attractive and worthy of greater social esteem, an idea that
had been introduced into the culture by European colonists. Cox later explored this color line in *Caste, Class, and Race: A Study in Social Dynamics* (1948), in which he argued that such an obsession with skin color prevented social cohesion among blacks, who would otherwise have shared a similar interest in opposing social oppression.

In 1919 Cox moved to the United States and settled in Chicago. The summer of that year became known as “Red Summer” after racial tensions in Chicago erupted into major riots and fighting between whites and blacks, resulting in deaths as well as numerous injuries and arrests. Cox, however, was not particularly concerned with social problems at that time; he was primarily focused on gaining a college education. His schooling in Trinidad was not deemed equivalent to a high school education in the United States, and Cox had to return to high school. He graduated in 1923, and went on to earn a two-year college degree in 1925, and a bachelor of science degree from Northwestern University in 1928. The following year Cox was incapacitated by polio, and he was confined to a wheelchair for the remainder of his life. However, by that time he had decided to become an academic, and he entered the University of Chicago, where he earned a PhD in sociology in 1938 with a thesis on the “Factors Affecting the Marital Status of Negroes in the United States.” Cox subsequently held academic appointments at Wiley College in Marshall, Texas (1938–1944), the Tuskegee Institute in Alabama (1944–1949), and Lincoln University in Jefferson City, Missouri (1949–1974).

During his academic career, Cox developed the unique theory that ideology was responsible for producing a social system in which black people were considered inferior to whites. Cox observed that race antagonism developed in the fifteenth century with the rise of capitalism and nationalism, and that race conflict was not a natural or universal phenomenon but a specific ideology that had become embedded in social theory. For Cox, the purpose of this ideology was one group’s domination of another. In earlier societies, mechanisms and ideologies other than race, such as religion and culture, were used to subjugate entire groups of people. Cox argued that the ideology of white supremacy is inextricable from the political economy. Ideologies supporting control by whites are not designed to demonstrate that whites are superior to other human beings; rather, they are designed to proclaim that whites must be in control, and violence serves to enforce this arrangement. Racism, then, is not merely a system of beliefs; it is a relationship of power that is coordinated by an assembly of social institutions that work together to marginalize blacks. Cox identified seven “situations of race relations” that account for the varying demographics and organizations that develop in the assembling of social institutions.

At the center of these social institutions is the state. Cox’s major work, *Caste, Class, and Race*, demonstrated that a political class that espoused a race ideology had emerged in the United States, as well as in other nations, such as Nazi Germany. In such states, commitment to the state-sanctioned racial ideology leads to a citizen’s inclusion into the political class, whose primary goal is to control the state. The political class is organized to promote its heritage, an idea that Cox explored in *The Foundations of Capitalism* (1959) and *Capitalism as a System* (1962). The heritage of a capitalist state is that it emerges from and survives on the exploitation of lesser capitalist or non-capitalist territories and nations. Therefore, capitalism is not a unique development in the United States. Rather, the leading position of the United States in relation to other capitalist states, such as Great Britain, resulted because capitalism was inherited, embedded, and refined in the United States. Cox developed this theory in *Capitalism and American Leadership* (1962).

Cox’s views stood in opposition to the caste school of race relations that was led by the social psychologist John Dollard (1900–1980) and the social anthropologist W. Lloyd Warner (1898–1970). These scholars applied the concept of caste to understand the separation between blacks and whites in the United States. Cox argued that caste divisions in India were a coherent system based on the rule of inequality. In such a system, a man’s child by a woman of a lower caste, for example, might become accepted into the father’s higher caste. In contrast, the U.S. color line contradicted an American creed of equality for all people, and a technique of “passing” developed to conceal the “lower” racial status of a “mixed-blood” person. However, if the mixed blood of a passing individual were ever discovered, it could trigger severe consequences.

In *Caste, Class, and Race*, Cox disputed the twentieth century’s major sociological theories examining race relations. In addition to his critique of the caste school, Cox demonstrated the weaknesses in analyses by other major scholars, including the cultural anthropologist Ruth Benedict (1887–1948), the sociologist Robert E. Park (1864–1944), and the sociologist Gunnar Myrdal (1898–1987). Benedict promoted a rhetorical explanation of “racism,” while Park saw race relations as cycles starting with contact and ending in assimilation of subordinate groups, and Myrdal argued that racial segregation was a moral problem of the “white” race. In opposing these views, Cox stressed the inextricable relationship between capital and racial antagonism. He argued that capitalism could not have developed out of feudalism, and had to be viewed as a form of social organization in which a capitalist nation is inconceivable without a capitalist world system. Cox concluded that three social forces were essential—an economic order, a national and territorial
government, and a religious structure—before a racial organization could be produced and sustained.

**CRAZY HORSE**

**c. 1842–1877**

Crazy Horse (a translation of his Lakotan name, Tasunke Witko) achieved notoriety while he was alive for his skill as a military leader and his defiant attempt to resist Westernizing influences. Since his death, his actions have taken on further meaning, and he is highly regarded as a symbol of Lakota resistance, oftentimes considered wakan (spiritually powerful), and he continues to be emblematic of a traditional past.

Crazy Horse was born in 1841 or 1842 near the Black Hills (South Dakota). He apparently had yellow-brown hair and was initially called Light Hair and Curly. His father was a medicine man; but less is known about his mother, who died young; his father later remarried. He was reportedly good with horses, and this garnered him the name His Horses Looking. His interest in a married woman, Black Buffalo Woman, led to a shooting that left Crazy Horse with a scar. Later, he married Black Shawl and they had a daughter, They Are Afraid of Her, who died at age 2. In 1877 he also married Nellie Laravie, an 18-year-old mixed-blood woman.

His father and grandfather both were named Crazy Horse, and he himself finally earned this name in his teen years. Around this time, Crazy Horse had a vision that involved a horseman who is plainly dressed and riding untouched through a storm. Crazy Horse himself began to dress plainly, with a red-tailed hawk feather, and it was assumed that he and his horse were invulnerable. There are also reports that he would throw dust over his horse before battle and that he wore a small stone, or wotawe (sacred charm), for protection. He was a quiet and introspective man who seldom joined in public events.

In an effort to resolve the conflicts following from Western expansion, Red Cloud and Spotted Tail agreed to settle at agencies, camps associated with government Indian agents that later became reservations, with the signing of the 1868 Fort Laramie treaty. Crazy Horse alone resolved to stay on his own lands in the Black Hills, until several events led to his surrender. Gold was discovered in the Black Hills and battles commenced against those who resisted the order to reservation land. Crazy Horse fought his best in the last two great battles, Rosebud and Little Bighorn. On June 17, 1876, assaults forced Brigadier General George Crook’s troops to retreat at the Battle of the Rosebud. Days later (June 25), Crazy Horse and others led the victory against Lieutenant Colonel George Armstrong Custer at the Battle of Little Bighorn.

These victories led to increased military pressure and famine. Supplies and morale diminished at Crazy Horse’s camp with the dwindling of buffalo, restricted trade, and a cold winter. Given the promise of an agency in the northern country, Crazy Horse led 889 followers to Fort Robinson in May 1877, but the promised agency fell through, and Crazy Horse was given a campsite near Red Cloud’s agency close to the White River (Nebraska). There was concern on the part of those trying to maintain stable relations—both Indian agents and Lakota leaders—that Crazy Horse would continue to hunt, given his refusal of rations, and that he would weaken the elders’ efforts to maintain peace at the agency. Also, there might have been concern from the Lakota leaders of Red Cloud’s and Spotted Tail’s agencies that Crazy Horse was gaining too much favor from the Indian agents and unsettling the status of existing agencies.

After four months in the camps, General Crook issued an order for Crazy Horse’s arrest. Crazy Horse at first assumed he was going to a council meeting, but resisted when he realized he might be imprisoned. It
seems that his ally Little Big Man restrained him, either to placate him, in order to protect himself from Crazy Horse’s knife, or to serve questionable political interests. A low-ranking cavalry soldier named William Gentiles is credited with stabbing Crazy Horse with a bayonet, intentionally or not. Crazy Horse died September 5, 1877, at Fort Robinson, and his father buried his son at an undisclosed site with the agreement of those in attendance that they smoke a pipe and pledge not to reveal its location.

**CREAMING**

Creaming (creaming off, or skimming) is the practice of serving a select client base in order to improve the efficiency or efficacy of a treatment. Creaming generally occurs in a response to incentives. For example, when hospitals receive a fixed reimbursement payment for treating a given ailment, they have an incentive to seek out the most healthy patients among those afflicted with that condition; this improves the apparent efficiency of their care because the most healthy can typically be treated at lower cost. Similarly, job training programs that are evaluated based on the success of their clients obtaining subsequent employment have an incentive to recruit clients who are most likely to succeed following the completion of their training; in doing so the programs appear highly effective. Scholars continue to debate whether specialized schools such as magnet or charter schools practice creaming by attracting the strongest students from within the larger pool of students who are eligible to attend.

The practice of creaming has both social and statistical consequences. When clients (patients, trainees, or students, for example) who are already relatively advantaged obtain the most favorable treatment, inequality of opportunity is exacerbated. In some cases, that may be a goal of the program, such as when the aim is to maximize the number of program completers who are able to perform a specific role following training. More often, however, creaming produces results that are considered undesirable because it allocates resources unequally in favor of those who are already privileged. As an example, school choice programs that allow greater access to specialized schools to children from more educated families tend to increase rather than reduce segregation and inequality.

The statistical consequence of creaming is that it tends to distort efforts to assess program impact. Viewed narrowly as intended for a select population, creaming may limit generalizability; that is, if the program is intended for a particular subgroup, its effects may be properly assessed on that subgroup, but the effects may not generalize to the larger population. This pattern may be uncovered through examination of disaggregated data to identify the relevant subgroups. Generally, however, creaming produces biased estimates of program effects when the estimates fail to take into account the selectivity of the population undergoing the favored treatment in contrast to those without such access. Anderson, Burkhauser, and Raymond showed in a 1993 study that the remarkable performance of the Job Training Partnership Act of 1982 (a federal employment program in the United States) in preparing unemployed persons for work reflected in part the selection of those trainees who were most likely to obtain employment irrespective of their training opportunities. However, the bias was not as large as the critics had supposed. Responses to bias caused by creaming include statistical adjustments, such as instrumental variables analyses and propensity score models, and design-based solutions, such as randomized controlled trials with random assignment of participants to treatment and control groups.

CREAMY LAYER, THE

The affirmative action program in India (the reservation, or quota, system) has shown substantial redistributive effects, in that access to education and jobs is spread wider in the spectrum of Scheduled Castes and Scheduled Tribes (SCs and STs) than it had been previously. This redistribution is not spread evenly throughout the beneficiary groups, however. There is evidence of clustering, and the benefits of the program appear to be confined to a narrow, privileged section of the SCs and STs. This elite section is referred to, in popular discourse, as the “creamy layer.” The existence of this layer is one of the arguments used to oppose the affirmative action program. However, this tendency toward clustering is not unique to this program, and it probably reflects structural factors, for the better-off sections enjoy a disproportionate share of benefits in every government program in India.

One of the critiques of the reservation system argues that the vast majority of Dalits are rural and poor. Dalit, literally “the oppressed,” is a term of pride referring to the SCs and STs, the latter a product of official terminology. Because the reservation of jobs and seats in institutions of higher education is meaningful mainly in urban areas, the benefits are cornered by the “creamy layer,” leaving the vast majority of Dalits untouched. However, even the limited reservation of jobs has brought a many-fold increase in the number of families liberated from subservient roles. In addition, the reservation of jobs, even if confined to urban areas, offers a potential avenue of employment that even rural Dalits can aspire to.

One of the concerns about the quota system is that, in the short run, beneficiaries might get singled out and experience social rejection in offices, college hostels, and other places where they are introduced through affirmative action. (There is no explicit affirmative action in college hostels, however, and affirmative action in colleges leads to the entry of SC/ST students into college hostels.) In the long run, however, education and jobs weaken the stigmatizing association of Dalits with ignorance and incompetence. Thus, the existence of the “creamy layer” can perhaps play a positive role, for successful members of the Dalit community demonstrate that, when given equal opportunity over a few generations, they can be just as successful as non-Dalits and are not intrinsically “inferior.”

The existence of the creamy layer or the Dalit middle class has kept the beneficiary groups and their problems visible to the educated public. Thus, it is no longer possible for any political party to publicly oppose affirmative action. However, given the pro-upper-caste and anti-affirmative-action bias of the political and social elite, this has not translated into motivated widespread concern for the inclusion of Dalits beyond what is mandated by government policy.

One of the objectives of the affirmative action program is to achieve upward social mobility of the Dalits. However, while this mobility is limited and ought to be viewed positively, it is pejoratively described as a “creamy layer” within the Dalit community. Concerns about intra-group inequality are not invalid, but estimates indicate that intra-group inequality is much more significant among the non-Dalits than among the Dalits. Thus, contrary to conventional wisdom, if groups need to worry about their own creamy layer, the concern should be far greater for the non-Dalits than for the Dalits.

CREATIONISM

Creationism is an idiosyncratic form of Protestant biblical literalism that developed in the United States in the nineteenth century. Creationism comes in two forms, one that accepts that the earth is probably very old but that insists that there was an intervention of a creative kind at the beginning to populate the world with organisms, and the other—known as young earth creationism—that claims that the earth is about six thousand years old (based on the genealogies of the Bible). Creationism should not be confused with the belief by Christians (and others in the Abrahamic tradition) that God created the earth from nothing, nor should it be confused with traditional Christian thinking about the veracity of the Bible. From at least the time of Saint Augustine (354–430 CE), it has...
been the position of Christians—Catholics and (later) Protestants—that God often spoke in simplified or metaphorical terms, and that the Bible should not be used as a work of science. In an oft-quoted phrase, the Bible tells human beings where they are going, not where they came from. It should also be noted that although traditional Christianity has always had a place for natural theology, proving God and his attributes through reason, it has never been the case that natural theology has taken the primary role. For Christians, faith is what counts. Hence when skeptics criticize proofs—for instance, pointing out that if one claims that God is the first cause, then who caused God?—believers are not worried. They argue that God is the cause of himself and this is something that is beyond rational proof.

The nineteenth century saw major divisions in the United States, particularly between North and South, exploding into the violent Civil War (1861–1865), something that to this day still marks social and cultural fractures in the country. People in the North, particularly Protestants from older denominations (Episcopalians, Presbyterians, Unitarians), moved steadily in tune with the major movements from Europe, especially the movement to interpret the Bible as a work written by humans (so-called higher criticism), and advances in science, especially Charles Darwin's (1809–1882) theory of evolution as expressed in his On the Origin of Species (1859).

In the South, and increasingly (as the country moved West) in the central states, Protestants in the more evangelical religions (Baptists and Methodists) turned to the Bible read literally for comfort and understanding. Holy scripture was used to justify slavery and, after the Civil War, many took heart in the ways in which God often punishes or makes life hard for those who have a special place in his heart. The Old Testament story of the Israelites in captivity in Babylon was taken to be a cameo in his heart. The New Testament was also interpreted literally.

As before, the main message was less one of science and more one of social prescription, with dire warnings about a nation lax on sexual and other morals. Because The Genesis Flood was clearly religious in nature and because of the constitutional separation of church and state in the United States, creationists (as they were now called) began to present a supposedly science-based version of their views—creation science—and a law mandating its treatment in state-supported schools was enacted in Arkansas in 1981. A federal judge ruled the law unconstitutional, and a similar bill in Louisiana met a similar fate later in the decade. But creationism was evolving and since 1990 has presented itself in a new guise, intelligent design theory. Sparked by law professor Phillip E. Johnson, author of Darwin on Trial (1991), its supporters claim that the organic world is so complex that it could not have been produced by blind law. Publicly, it is denied that this intelligent designer necessarily has anything to do with the God of the Bible. Privately, both supporters and opponents agree that intelligent design theory is a form of creationism-lite designed to slip through the barriers between church and state.

Legally, intelligent design theory has been no more successful than creation science. In 2005 a federal judge in Dover, Pennsylvania, ruled that it is not science and hence cannot be taught in state schools. But the battle is not yet over, especially given that polls constantly show more than
50 percent of Americans believe that the earth was created in six days less than ten thousand years ago.

Creationism remains a threat to biology, and also to the rest of science. Geological theories about plate tectonics are ruled out, physical theories about big bangs are ruled out, and in the social sciences, at the very least, anthropology and archeology as understood today are made impossible. This point should be emphasized, for often people think that creationism affects only the biological sciences. If one takes a literal biblical view, then it is hard to see how one can have any approach to humankind that argues (for instance) that social factors were supreme in ordering human behavior. The same is true of biological factors with the same effects—for instance, the purported discovery by geneticist Dean Hamer (2004) that there is a gene for belief in God’s existence. All of these things—for instance, the suggestion that sexual orientation might not be a function of someone’s free will—will be anathematized. So far, science is holding fast, but the battle has not ended.

CREATIVE DESTRUCTION

The phrase creative destruction was introduced by the economist Joseph Schumpeter (1883–1950) in 1942 to describe the process by which innovation occurs in capitalist societies. A “process of industrial mutation” occurs as markets are opened up, revolutionizing “the economic structure from within, incessantly destroying the old one, incessantly creating a new one.” Schumpeter called this process “creative destruction,” and he held that it was the “essential fact about capitalism” (1962, p. 83).

For Schumpeter, the competitive process that characterized capitalism was not the timid elements of cost reduction but instead the creation of new products, new technology, or new markets, all of which threatened the lives of currently existing products or firms (1962, p. 84). It was such innovation that, for Schumpeter, generated overall economic growth and development, even while it often destroyed the value of sustained companies and monopoly rents. Successful innovation created new monopoly rents, but the process continued with waves of successive innovation. Schumpeter’s theory of creative destruction provides an explanation for dynamic industrial change.

The “Schumpeterian hypothesis” that temporary monopoly power is associated with economic growth has engaged generations of empirical workers who struggle with the requirement to make precise what is understood by “temporary” and “innovation” and what must be treated as exogenous to make such tests. There seems to be evidence for a positive association between research and development productivity and firm size, but it is not clear that this is sufficient for the hypothesis itself. Recent work on endogenous growth theory has attempted to operationalize Schumpeter’s notion of creative destruction by which one innovation destroys another.

The creative energy for innovation was supplied, Schumpeter argued, by the entrepreneur. It was the entrepreneur who found the means to put new inventions into place. Like Karl Marx (1818–1883), Schumpeter was persuaded that capitalism was destined to pass away: “Can capitalism survive?” Schumpeter asks in Capitalism, Socialism, and Democracy (1942), “No. I do not think it can” (1962, p. 61). But unlike Marx, Schumpeter saw the threat to capitalism coming from its very success, from an overreliance on rationality that he associated with capitalism. And unlike Marx, Schumpeter offered a prediction, not a prescription.

Schumpeter’s is a “tory” worldview (Stolper 1994, p. 30), not a sedate caricature of the feudal past but instead something akin to that expressed in Scottish essayist and historian Thomas Carlyle’s (1795–1881) description of the captains of industry as the heroes for a new age. Markus C. Becker and Thorbjørn Knudsen’s 2002 translation of omitted material from Schumpeter’s Theory of Economic Development (1911) makes clear the parallel between Schumpeter’s entrepreneur and Carlyle’s hero. Creative destruction is capitalism in the age of the hero, where the entrepreneur provides the creative energy for innovation and the destruction that it entails. What will
destroy capitalism is the rationality that kills the heroic (Schumpeter 1962, p. 160).

Without the heroic ethic, which regards risk-taking as an obligation, the capitalist could not defend himself against those who wished to arrest the gales of creative destruction. In notes to Schumpeter’s “Can Capitalism Survive?” the editor reports this fascinating floor discussion:

Schumpeter was now asked why the feudal class in its days of glory was so much more capable of defending itself than the bourgeoisie is today. According to Schumpeter the answer was very simple. The knights of the feudal times were trained to fight and in battle they were superior to everyone else. The only way of defending itself that the bourgeoisie, however, has, is to take up the telephone and telephone Senator X and say, “Good God! Good God! Can’t you help us?” (Schumpeter 1991, p. 315)

This would not have been the response from an older capitalism manned by those bound to spouse and children, for whom “navigare necesse est, vivere non nesse est” (Seafaring is necessary, living is not), as noted in an inscription on an old house in Bremen, Germany (Schumpeter 1962, p. 160).

On the face of it, Schumpeter’s analysis suggests a role for policy in the promotion of growth through patent laws or subsidized research and development. But if Schumpeter’s capitalist can call up government assistance with a telephone call, then government policy with regard to technology should be considered endogenous. Once policy related to technological change is endogenous, it may benefit the existing few instead of the uncreated many of the future.

CREATIVITY

Since the mid-nineteenth century creativity has become increasingly recognized as an extremely valuable natural resource. It plays a role in cultural evolution, innovation, and virtually all societal change. It also plays a significant role on an individual level, contributing to psychological health, learning, and adaptability, as well as to artistic and scientific endeavors. Creativity is not easy to define, in part because it plays such diverse roles.

DEFINING CREATIVITY

When defining creativity most people agree that originality is necessary but not sufficient for creativity. Yet creative things are more than merely original; they must also be fitting, solve a problem, or have some sort of value or aesthetic appeal. This is especially easy to see when creativity is put to use solving problems, for then the creative solution is an original one that also solves the problem. Yet many creative activities and behaviors do not depend on problem solving. Sometimes, creativity is self-expression.

Creativity may also be distinguished from problem solving by defining it to include problem finding, which must occur before a solution is attempted. Problem finding may involve problem identification (recognizing that there is a problem at hand) or problem definition and redefinition (changing a problem such that it can be solved). The German physicist Albert Einstein (1879–1955) and many other unambiguously creative individuals have pointed to problem finding as more important to creative achievement than problem solving.

Definitions of creativity are sometimes debated because it can be difficult to separate self-expression from problem solving. This ambiguity is apparent in the arts, where self-expression is artistic performance; yet artists may be solving problems of technique or solving problems in the sense of finding the best way to express themselves. It may even be that there are preconscious processes at work and the artist is dealing with a problem, even if the artist him- or herself is unaware of the origin or exact nature of the problem. Engaging in artwork can sometimes be an attempt to clarify one’s thinking and feelings.

PERSONALITY CHARACTERISTICS

Researchers agree that creativity is tied to motivation. Studies of eminent individuals, as well as investigations that recognize the wider distribution of creative potential, confirm that creativity does not just occur. People work at it, are interested in it, and intentionally nurture or utilize it. Although some creative achievements have been extrinsically motivated, and the creator interested in fame, money, or some sort of reward, it appears as if the vast majority of creative actions are motivated by intrinsic
interests. In fact, when an individual is intrinsically interested to perform in a creative fashion, extrinsic incentives can undermine and lower the eventual creative output. Intrinsic interest is also tied to the creative process in the sense that individuals may be more capable of considering a broad range of options and more capable of finding original insights when extrinsic pressures do not distract them.

Personality studies often include intrinsic motivation as one of the core characteristics of creativity. Other relevant personality characteristics include a wide range of interests, autonomy, openness to experience, and nonconformity. Frequently humor and introversion are tied to creativity, but there is much more variation with these two character traits. Some creative domains, such as the performing arts, preclude introversion. The most widely recognized domains that include creativity are linguistic, mathematical, musical, and scientific, though some theories also pinpoint bodily-kinesthetic, interpersonal, and intrapersonal domains. Contemporary research has supported an everyday domain, which includes original and adaptive behaviors used in daily life (e.g., when driving, cooking, and conversing).

It is not uncommon for social scientists to also include seemingly unhealthy characteristics in the list of personality traits that are related to creativity. Nonconformity can be considered one such trait, in the sense that an individual can have excess nonconformity and thereby be alienated from social activities. Another common example of a potentially unhealthful tendency involves affect, and in particular mood disorders. These are frequently observed in eminent creative individuals, and there are reasons to believe that mood swings can facilitate the creative process. Mood disorders contribute to the long-standing and widely recognized stereotype of the mad genius or the highly eccentric creative person.

Another characteristic that may contribute to the creative process involves the capacity to tap one’s unconscious. The Swiss psychologist Carl Jung (1875–1961) emphasized the creative individual’s capacity to utilize unconscious material in an effective manner, saying that “the ability to reach a rich vein of such material [from the unconscious] and to translate it effectively into philosophy, literature, music, or scientific discovery is one of the hallmarks of what we call genius” (1964, p. 25). He also concluded that “completely new thoughts and creative ideas can also present themselves from the unconscious—thoughts and ideas that have never been conscious before. They grow up from the dark depths of the mind like a lotus and form a most important part of the subliminal psyche” (p. 25).

For Jung, material from the unconscious often takes a symbolic form. Some symbols are widely shared, as is implied by Jung’s theory of the collective unconscious. Jung’s view of creativity and the unconscious is entirely consistent with late-twentieth-century views of incubation and its role in creative thought. Biographies of famous creators often describe how good ideas and insights depend on this kind of incubation and only become conscious through sudden insight, often described as the “a-ha!” moment. On the other hand, in 1988 the psychologist Howard Gruber demonstrated that sudden insights are not all that sudden; instead they are protracted and require time and energy. The appearance of the insight is sudden, but the thinking that led up to it is not. However, because insight is an unconscious process, one is not necessarily aware of the work involved in bringing it about.

PROGRAMS AND TECHNIQUES TO ENHANCE CREATIVITY

Many programs and techniques have been designed to encourage and enhance creative potential. Some techniques focus on very specific tactics that can help the individual break mental sets, question assumptions, become more flexible and original, shift perspectives, and produce original insights. Other programs are formal educational efforts and parts of programs for gifted and talented children, which depend heavily on tests of creativity. The most common test utilizes the concept of divergent thinking, which involves performing open-ended tasks that produce a large number of ideas or answers, many of which are divergent or remote. Divergent thinking tasks are statistically independent from convergent thinking tasks (which yield one correct or conventional answer), meaning that children who produce many original ideas may not be the ones who have high intelligence quotients (IQs), and vice versa. Divergent thinking is only moderately predictive of real-world achievement, however, probably because many other factors play a role in the creative process. Intrinsic motivation is an example of one of these other influences on creative work. An individual needs more than the capacity to produce ideas and think in an original fashion; he or she also needs to be interested in doing just that, and perhaps also have the temperament to be unique and unconventional.

Educational programs targeting creativity assume that creativity is widely distributed in the human population. Because creativity is a multifaceted personality trait, existing educational programs and existing tests of creative potential may not fully capture the range of possible creative expressions, nor even the multidimensional nature of the creative process.

Credentialism

Credentialism, as a social phenomenon, refers to reliance upon formal credentials conferred by educational institutions, professional organizations, and other associations as a principal means to determine the qualifications of individuals to perform a range of particular occupational tasks or to make authoritative statements as “experts” in specific subject areas. As an ideology, it reflects the ostensibly meritocratic idea that positions within the occupational structure ought to be filled by those who have obtained their qualifications through institutional mechanisms (e.g., training and education within certified schools; successful completion of formal examinations) culminating in the attainment of degrees, diplomas, or certificates. As a social-scientific concept, it is closely associated with the discourses of the sociologies of education and work.

Historically, the concept of credentialism emerged as part of the critique of professionalism and in the service of the “deschooling movement” of the 1960s and 1970s. Radical critics of professional education, such as Ivan Ilich (1971), proceeded from the assumption that most if not all of the skills needed to competently perform the work tasks carried out by many professionals could be acquired through practical experience and with much less in the way of formal schooling than is usually needed to obtain the “required” credentials. From this perspective, the disguised purpose of much formal schooling (its “hidden curriculum”) is to impart a particular disciplinary paradigm, ideological orientation, or set of values to those seeking formal credentials to work in prestigious or “high-status” fields such as medicine, law, and education. Furthermore, the credential systems developed in a number of occupational areas are part of the “collective mobility projects” of practitioners to achieve a “professional status” that brings with it greater material and symbolic rewards. Thus credentialism is closely associated with strategies of “social closure” (to use Max Weber’s expression) that permit social groups to maximize rewards “by restricting access to resources and opportunities to a limited circle of eligibles” (Parkin 1979, p. 44).

The pursuit of credentials through bureaucratized, institutional channels constitutes a kind of “rite of passage” for those who aspire to socially privileged positions while also allowing established professional or occupational groups to control the supply of practitioners, to regulate their activities, and to maintain a monopoly of legitimacy in the provision of particular services. The credential system also legitimates the establishment of legal restrictions by the state in concert with professional, occupational, or skilled trades associations concerning who is deemed qualified to perform particular tasks or provide specific services. One example has been the legal barriers that have been put into place in many jurisdictions to prevent midwives from providing birthing services to expectant mothers, thereby ensuring that such services will remain the exclusive preserve of medical doctors.

The “credential inflation” that occurred over the last third of the twentieth century was a product of the tremendous expansion in postsecondary education that occurred in many of the more developed industrial or “postindustrial” societies in the post–World War II (1939–1945) era. Jobs previously filled by people possessing only high-school diplomas (for example, insurance salespeople) were increasingly filled by those with college diplomas or undergraduate university degrees. The proliferation of employment opportunities in the “service sector” combined with the contraction of the manufacturing labor force increased labor market competition for “white-collar” jobs requiring reasonably high levels of literacy or numeracy. However, many if not most of these jobs did not require as many specific skill sets as the blue-collar jobs that they displaced. It is therefore arguable whether the shift from a predominantly manufacturing to a “service” or even “knowledge-based” economy has brought with it the imperative of higher levels of formal educational attainment for the mass of the labor force. Even so, the members of this labor force have felt compelled to pursue higher levels of education (as symbolized by college diplomas and university degrees) to avoid relegation to employment in the vast array of poorly paid and menial jobs that characterize the so-called “postindustrial” economy. In this context, a college diploma or undergraduate university degree is not so much a ticket to “success” as a safeguard against migration into the most undesirable regions of the labor market. The corollary to this phenomenon is that many workers regard themselves as overqualified for the jobs they perform and experience workplace dissatisfaction stemming from the perception that many of the intellectual skills they attained through “higher education” are being underutilized or even wasted.

With the advent of globalization and the increased mobility of professionals and workers of all kinds across

Mark A. Runco
national boundaries, the problem of recognizing “credentials” obtained in other countries has come to the fore. On the one hand, professional organizations and other occupational associations are concerned that the influx of such credentialed individuals may weaken their control over the supply of “qualified” labor; on the other hand, governments are under pressure to recognize such “foreign credentials” by a public that is anxious to alleviate a real or perceived scarcity of professional service providers in such areas as medicine and law.

For most of its critics, credentialism is fundamentally a set of practices and an ideology associated with the reproduction of structures of social inequality and the intergenerational perpetuation of class and status distinctions. For its defenders, it is an inevitable concomitant of a rationalized occupational division of labor, necessary to maintaining optimal levels of productivity and performance. There are clearly elements of truth in both positions, but their satisfactory articulation requires recognition of the ways in which class, race, gender, and citizenship shape both occupational and opportunity structures in contemporary societies and of how credentialism conceals and obscures this reality behind a rationale of technical necessity.

**SEE** Critical Race Theory.

**CREOLE**

The English term *creole* derives from the Portuguese antecedent *crioulo*, which was adopted by the Spanish as *criollo* (“person native to a locality”) and the French as *créole*. The Portuguese word *crioulo* is a diminutive of *criar*, meaning a person raised in the house, usually a servant. The derivation is from the verb *criar*, “to bring up or raise as children,” from the Latin *creare*, “to beget.” Thus, from very early on the term has indicated novel creation, usually of a lower-status person, and has implied that this novelty is “irregular,” or out of place. The term gained currency during the initial growth of European colonial power in the sixteenth century. As European powers established colonies in the Americas, Africa, Asia, and Oceania, new populations were created out of unions between the colonizers, local inhabitants, and immigrants (initially slaves or laborers) transported by Europeans. Initially, the term *creole* was assigned to people born in the colonies, to distinguish them from the upper-class, European-born immigrants. The application of the term has varied from place to place and era to era in important ways, and has also been used to designate languages that have evolved from historical experiences of cultural contact.

**CREOLE LANGUAGE**

In general, a Creole language is a defined and stable language that arises from long-standing contact between two or more distinct languages. Prior to “creolization,” a rudimentary contact language is known as a *pidgin*. Typically, with Creole languages there are many distinctive features that do not derive from any of the parent tongues. In cases where a Creole person was simply a European born in the New World, there was usually no distinction between the language spoken by foreign colonials and their local, white, counterparts. However, as the notion of a Creole came to include anyone born in the New World, the term came to encompass hybrid linguistic forms, some of whose antecedents were not European languages. Generally, Creole populations occupied a low status in the eyes of European colonial administrators, thus Creole languages were regarded as “impoverished dialects” of the colonial languages, and eventually the term was used in opposition to the term *language*, rather than as a type of language. For example, one might say a French Creole as opposed to a Creole language based on French and Fon (a language of West Africa). However, in contemporary linguistics such distinctions are not made, and Creole languages are treated equally alongside other types of

language. Furthermore, the term creole and its cognates in other languages—such as crioulo, criollo, and so on—are now applied to distinct languages and ethnic groups in many countries and from a variety of eras, and the terms all have rather different meanings.

**CREOLE GROUPS**

The Portuguese term crioulo can be traced to the fifteenth century, when it gained currency in the trading and military outposts established by Portugal in West Africa and Cape Verde. Initially it simply meant a Portuguese person born and raised in the colony. (The word then came into use, in translation, by other colonial powers.) In the Portuguese colonies the crioulo population eventually came to comprise people of mixed Portuguese and African ancestry; especially as the growing numbers of mixed heritage dwarfed the population of local whites. In time, crioulos of mixed Portuguese and African descent produced important ethnic groups in Africa, especially in Cape Verde, Angola, Mozambique, Guinea-Bissau, São Tomé e Príncipe, and Ziguinchor. These groups have come to think of themselves as culturally distinct from their neighbors. In Brazil, a Portuguese colony from the sixteenth century to 1822, the word came to mean a person with especially dark skin, indicating a strong African heritage. African slaves were imported into Brazil from the seventeenth century until the first half of the nineteenth century. The presence of large numbers of Africans from ethnically diverse origins led to a substantial mixed population as Africans and Europeans began to have children. Mixing was encouraged by many nationalist Brazilian intellectuals as a way of “whitening” the population thereby creating a unique, New World Brazilian identity separate from a Portuguese or European one. As a result, crioulo came to be a purely phenotypic label, with harsh, negative connotations.

As in the Portuguese colonies, the Spanish term criollo initially meant a person of unmixed Spanish ancestry born in the New World. Locally born Europeans were prohibited from holding offices of high rank and were often shunned socially by the ruling peninsulares, or Spaniards born on the Iberian Peninsula.

Eventually the exclusion of the criollos by the foreign-born Spanish led to widespread rebellion and the development of a nativist movement. By the 1830s these Creole-based nationalist wars of independence had spread throughout Spanish-speaking Latin America in the form of the Mexican War of Independence (1810–1821) and the South American Wars of Independence (1810–1825).

In other parts of the Spanish Empire the term criollo did not enjoy the same currency. Inhabitants of the Spanish colony of the Philippines, for example, generally referred to the locally born Spanish as Filipinos or insulares (“from the islands”). (Peninsulares was still the common name for those born in the Iberian Peninsula.) Today the term Filipino means quite the opposite, indicating a locally born, often ethnically mixed inhabitant of the Philippines. This transformation came about as a result of the Filipino nationalist movements of the late nineteenth century.

In the United States the word creole has a complex cluster of meanings and is often misunderstood. In general, a Creole is a person of any race or racial mixture descended from the original European settlers of French Louisiana prior to its incorporation into the United States via the Louisiana Purchase in 1803. It is quite common for Americans in other parts of the country to assume that a Creole is a person of mixed African and European ancestry in Louisiana, but this is not the way the term has historically been used locally. Creoles encompass a wide variety of people of many ethnicities and races who share a French or even Spanish background. Most commonly, a Creole person can lay claim to a francophone heritage from either France or a French-speaking Caribbean island such as Haiti (Saint Domingue prior to 1804), Martinique, or Guadeloupe. White and “colored” migrants from these regions brought their French-speaking, predominantly African slaves with them, thereby establishing a racially heterogeneous Creole population of Louisianans. The Louisiana French, who trace their ancestry to the Acadians of French Canada, usually identify themselves as Cajun. The distinction is sometimes made for local cuisine as well, with a distinction being made between Creole food, which has many African elements, and Cajun cooking, which derives from the culinary practices of mostly white, often rural Cajun-French speakers in Louisiana.

Although in the Americas Creoles were initially Europeans born in the New World, the idea of a mixed population being a “Creole” population has gained wide currency. Indeed, creolization has come to mean the blending of one or more cultural identities into a new, hybrid identity. Toward that end, people of mixed native Alaskan and Russian ancestry are frequently called “Alaskan Creoles.” In the late eighteenth century Russian adventurers, hunters, and traders known as promyshtleniki came into contact with and married or formed unions with native Alaskan women, giving rise to a people who assumed a prominent position in the economy of fur trading in the northern Pacific. For example, by 1880, the U.S. census documented fifty-three “Creoles” (people of Russian-Sugpiaq ancestry) living in Ninilchik, a village located on the west coast of the Kenai Peninsula in Alaska. There also exist varieties of Russian-native Alaskan languages—either pidgins or Creoles—throughout the region, such as Copper Island Aleut, a mixed Aleut-Russian language spoken on Medny, or Copper Island.

In the English-speaking Caribbean a Creole was originally a European born in the New World, but the term is
most commonly used to describe anyone, regardless of race or ethnicity, who was born and raised in the region. It is also in the English-speaking, formerly British colonial Caribbean that the term has come to indicate the syncretism or blending of the various cultural forms or institutions: African, French, British, and Spanish, among others. Creolization in this context can mean anything from syncretized religious forms such as Vodou, Santeria, and Orisha, to culinary practices, to musical forms such as calypso, reggae, mambo, zouk, merengue, and many others. Yet the term also may have a variety of local meanings. In Trinidad, for instance, Creole culture generally refers to the practices of local African-Trinidadians as opposed to local whites (often known as French Creoles) and Indo-Trinidadians (the descendants of Indian indentured laborers brought to the island from 1845 to 1917).

In Réunion island and Mauritius, in the Indian Ocean, Creoles fall generally into two categories: (Malagasy) Creoles and Creole-Mazambe. The former were brought in as slaves to work the plantations of Mauritius (as well as Réunion and Seychelles). These laborers were mostly Malagasy (natives of Madagascar), but other African minorities, from Mozambique, Malawi, Tanzania, and Zambia, also were enslaved. In present-day Mauritius Creoles of all kinds are outnumbered by the Indo-Mauritians; however, they still form the majority in Réunion and the Seychelles. Although English is the official language of Mauritius, a French-based Creole language is widely used by all ethnic groups.

CREOLIZATION

Creolization, in its most general meaning, is a process of cultural change, the origins of which lie in encounters between Africans and Europeans, initially in a context of slavery and colonialism. This process produces new “creole” cultures and societies. Creolization is characteristic of the Caribbean, Louisiana, and much of Latin America, where creole refers to people, languages, music, and things that are created in the “New World” but are not of indigenous ancestry. The term may also refer to the cultures of Liberia, Sierra Leone, and Mauritius. More specific meanings are demographic, where creolization refers to an increasing proportion of the population being locally born of African, European, or mixed descent, as distinct from both indigenous people and immigrants; and linguistic, where it means the development of a new language, such as Haitian or Jamaican Creole, which normally coexists with, but is distinct from, a particular European language.

Creole people, languages, and products resulted from interactions between external influences and local conditions, where power was a pervasive factor. When slave owners, missionaries, and colonial administrators tried to suppress African cultures and impose aspects of European cultures, they were often ignored or resisted. In many Caribbean societies during the period of slavery, most people were enslaved Africans who came from many different cultures, while power was exercised by a minority of Europeans and white Creoles. Africans tried to maintain their traditions, and the process of creolization was an adaptation to the physical environments and social constraints in which they lived. A creole culture is generally not homogeneous, but may be conceived as a continuum between its Afro-creole and Euro-creole variants.

Édouard Glissant, a poet, playwright, novelist, and cultural theorist from Martinique, views creolization as the central cultural process that defines the Caribbean. He emphasizes that creole cultures, like the ceaselessly changing creole languages, are characterized by diverse origins, fragmentation and adaptation, fluidity and openness. Glissant posits that the creolization process, unlike assimilation or acculturation, is creative, accepts difference, and remains open, because people may adopt aspects of “other” cultures without relinquishing their own.

The concept of creolization has ideological and political implications. Creole people and culture are evaluated negatively by those who consider them inferior because they are not “pure” European, but positively by those who view them as being authentic and appropriate to the places where they developed. The positive evaluation of creole culture and identity became an important aspect of cultural nationalism because it emphasizes the local and unifying nature of the creole way of life, but people and cultures that are defined as “noncreole” may be excluded.
from full participation in nations that are defined as creole. In Trinidad and Tobago, for example, the Afro-creole culture that includes carnival, calypso, and steel bands is promoted as the center of national culture, so many Trinidadians of Indian descent feel marginalized.

Acculturation, hybridization, and transculturation are related concepts that are more general in application than creolization. Acculturation emphasizes the process in which an ethnic group acquires another culture in a largely one-way process of cultural change, and hybridization implies a process of miscegenation, or biological mixing. Transculturation, a concept coined by the Cuban scholar Fernando Ortiz (1881–1969) in 1940, refers to the multiple interactions and creation of new cultures, not limited to creole cultures in the Caribbean. Creolization, despite its ideological implications, is a useful concept because it focuses on creative aspects of cultural change, without assuming the unlimited power and success of the Europeans, but it is limited by its specific association with cultures that originated from encounters between Africans and Europeans.

CRIME AND CRIMINOLOGY

Criminology is the study of crime, criminal behavior, and the criminal justice system. While this captures the essence of the discipline, there has been considerable debate about what constitutes criminal behavior and how it differs from other behaviors widely held to be socially deviant. This debate has produced five types of definitions of criminality: natural law explanations, moralistic explanations, labeling explanations, social harm explanations, and legalistic explanations.

Natural law explanations of criminality are perhaps the oldest of the five. They are influenced by natural law theory, which suggests that some behaviors must be universally prohibited because by their nature they are so morally repugnant or detrimental to the normal functioning of society. Like natural law definitions, moralistic definitions suggest that crime, as defined by statutes and codes, is a direct reflection of society's moral consensus. When the majority of people living in any given society finds a particular action morally reprehensible, their will, often expressed through representative legislators, becomes law.

In contrast to natural law and moralistic definitions of crime, labeling or critical definitions suggest that no behavior is intrinsically criminal, nor is the will of the majority of society members necessarily relevant to the designation of a behavior as criminal. Rather, crimes are behaviors that are defined as such by those in positions of power. In support of these claims, labeling theorists point out that affluent and powerful people are far more likely than the poor and powerless to escape criminal prosecution. In addition, when the affluent are subjected to criminal prosecution, because of their social status (which they have in common with those in positions to make law) they tend to escape being labeled as "criminal," a designation typically reserved for the poor and minorities. Other definitions of crime have rested on more pragmatic considerations, such as social harm. Harms-based definitions suggest that crime is any behavior that infringes upon basic human rights or otherwise produces individual or social harm.

Each of these theories has influenced how crime has been defined in different eras, but the definition that most of today's criminologists rely upon to distinguish criminal behavior from other types of social deviance is the legalistic definition. This definition suggests that a crime is any behavior that is legislatively prohibited and committed without defense or justification. When these three elements converge—an act or behavior, a statement by a legislature that these behaviors are unacceptable, and the absence of a legally valid reason for committing the act—then regardless of social harm, moral judgments, or relative power, a person has committed a crime.

One important caveat in any discussion of crime is that virtually everything people do in modern industrial and postindustrial societies is regulated by law, and most of it has nothing to do with the criminal law or crime. Contracts we enter into, nutrition labels on foods, levels of vehicle emissions, the amount of taxes we are required to pay, the methods we use in voting, the height of the buildings in which we work, and nearly everything else we
do and experience in our day-to-day lives are regulated by a complex web of laws that have nothing to do with criminal law. Nonetheless, because of the personal nature of many crimes, the criminal law tends to be the most visible category of law in modern societies.

**TYPES OF CRIME**

For the purposes of data collection and comparison, crime data is usually divided into two broad categories: personal crimes and property crimes. Personal crimes include crimes of violence such as murder and robbery as well as any other criminal offenses that involve direct contact between a perpetrator and a victim, such as rape, aggravated assault, and battery. Property crimes are those in which personal property is the object of the offense and there is no force or threat of force used against the person to whom the property rightfully belongs. Examples of property crimes include larceny-theft, burglary, motor-vehicle theft, and arson. Property crimes occur with far greater frequency than personal crimes, making up between 85 and 90 percent of all crimes reported to U.S. law-enforcement agencies. Expressed differently, according to official data, every 23.1 seconds in the United States a crime of violence is committed, and every 3.1 seconds a property crime is committed.

Beyond the distinction between personal and property crimes, other more detailed differentiation among criminal behaviors exist. Some of the more common crime types include violent crime, white collar and corporate crime, organized crime, and “victimless” crime. Other types not discussed in this article include hate crime, environmental crime, technological crime, and political crime.

**Violent Crime** There are four major violent crimes tracked by both the Federal Bureau of Investigation and most international policing agencies: murder, rape, robbery, and aggravated assault. Murder/nonnegligent manslaughter involves the willful killing of one human being by another without excuse or justification. In most cases, accomplices are equally as culpable in the victim’s death as the person who directly causes the victim’s death. Forcible rape involves unlawful sexual intercourse committed against the victim’s will. In the United States the trend has been to view both force by the accused and the victim’s substantial impairment of power to appraise or control conduct as bases for prosecution for rape. Many countries also recognize statutory rape—sexual intercourse with a person (usually female) under the legal age of consent (which varies from country to country). Robbery involves taking personal property from the possession of another against his or her will by the use or threat of force. The threat of violence is what distinguishes robbery from the lesser offense of theft. Aggravated assault refers to an unlawful attack by one person on another for the purpose of inflicting severe bodily injury.

Among Western industrialized nations, the United States long has been considered a particularly violent and crime-ridden society. However, according to the International Crime Victimization Survey, U.S. victimization rates for many personal and property crimes may not be much different from other nations (Mayhew and van Dijk 1997). This survey notwithstanding, the United States continues to have rates of murder and other serious violent crimes that vastly exceed those of other high-income nations.

**White Collar and Corporate Crime** The greatest economic costs to society from crime come not from those acts commonly referred to as “street crimes”—that is, the personal and property crimes that receive most of the public’s attention—but from white-collar and corporate crime. The term white-collar crime was coined by Edwin Sutherland, former president of the American Sociological Association. In his 1939 presidential address Sutherland discussed persons of the upper socioeconomic class whose criminal behavior is dealt with much less severely than that of the lower socioeconomic class (Sutherland 1940). He defined white-collar crime as “crimes committed by a person of high respectability and high social status in the course of his occupation” (Rosoff et al. 2003, p. 2), distinguishing it from crime committed by persons of a lower occupational status (“blue-collar”).

Contemporary criminologists have expanded Sutherland’s definition to include other types of crimes committed in the course of someone’s legitimate occupation. These more recent definitions of white-collar crime usually contain some or all of the following elements: an illegal act, committed by nonphysical means, with concealment or guile, to obtain money or property, or to obtain a business or personal advantage. Criminologists have also begun to recognize corporate crime as a distinct form of white-collar crime, in which the immediate benefits of the criminal behavior go to a corporation rather than to any particular individual.

In the United States conservative estimates place the material costs of white-collar at more than $300 billion annually. In comparison, losses from property theft/damages, cash losses, medical expenses, and lost pay due to injuries suffered or other activities related to other types of crime cost Americans an estimated $15 to $20 billion per year (Rosoff et al. 2003). Similarly, about 16,000 people are murdered each year in the United States, but far more people die as the result of white-collar criminal activities. For example, more than 100,000 people die each year in the United States because of neglect of worker-safety
requirements, on-the-job accidents, and exposure to hazardous materials in the workplace (Reiman 2003).

Organized Crime Organized crime refers to criminal enterprises that specialize in vice crimes such as gambling, prostitution, drug operations, and other correlated illegal activities, including money laundering and racketeering. The origin of organized crime in the United States is often traced to national Prohibition in the 1920s (Brown et al. 2004). The controversial federal ban on alcoholic beverages brought about by the passage of the Eighteenth Amendment to the Constitution and the Volstead Act created opportunities for criminal syndicates to flourish by illegally supplying liquor; later they were able to expand their enterprises into vice and other illicit activities. Today, in spite of international efforts to control organized crime, various sources estimate that international organized crime syndicates draw about $1 trillion in profits each year (Federal Bureau of Investigation 2006).

Victimless Crime Victimless crime refers to illicit behaviors in which the participants do not recognize that anyone involved in the illegal transaction is directly victimized by the deed. These crimes are often referred to as “complainantless” because nobody directly involved is likely to initiate enforcement by complaining to the police. Examples of victimless crimes include prostitution, pornography, illegal gambling, and drug use. Victimless crime is a contentious label because, while none of the parties sees themselves as victims, many people argue that society itself is harmed by the prohibited behaviors. For example, it is argued that illegal drug use drives up healthcare costs for everyone, destabilizes families and communities, drains worker productivity, and leads to a number of additional social problems. Further, a meta-analysis of North American studies on prostitution found that prostitutes are very likely to become victims of violence during the course of their work (Farley and Kelley 2000).

In contrast, other theorists argue that victimless crimes should not be considered crimes at all. Rather, they are private behaviors that, when criminalized, represent an overreach of the state’s authority. In support of these latter claims, they highlight the variations in prohibitions from state to state and country to country, and societal ambivalence toward many of the prohibited activities. Toward this last point, in 2004 an estimated 19.1 million Americans aged 12 or older were current illicit drug users, spending around $100 billion on illegal drugs. Critics of the criminalization of these behaviors also refer to substances such as alcohol and tobacco that are legally available but cause greater social harm than illicit substances.

The Social Production of Crime
Perhaps the most understudied area of criminology is the role society plays in fostering certain types of crime, such as domestic abuse, hate crime, and sexual assault. Over the past century most societies have changed for the better with regard to recognizing all people as equals irrespective of characteristics such as race, gender, sexual orientation, and religion. However, the extensive histories of inequality and violence have undoubtedly shaped how crimes are defined, and have also played a role in the types of crimes prevalent in any given society. For example, many theorists have argued that the relatively high rates of serious violent crime in the United States can be traced to the culture of violence produced during its particularly hostile formulation period: African slavery, Native American genocide, and warfare related to Manifest Destiny all set the stage for a future mired by violence.

Rape presents another example of the social production of crime. For much of world history, patriarchy has been a primary principle around which societies have been structured. Many theorists have argued that this history of socially constructed male supremacy is strongly correlated with rates of male-on-female sexual assault and has shaped how sexual assault has been defined over time. Only in the latter part of the twentieth century did U.S. lawmakers pass laws against marital rape—that is, a rape committed by a husband upon his lawful wife. Before then, the legal standard in the United States was largely consistent with that expressed by Sir Matthew Hale, a chief justice in seventeenth-century England, who wrote “the husband cannot be guilty of a rape committed by himself upon his lawful wife, for by their mutual matrimonial consent and contract, the wife hath given herself in kind unto the husband which she cannot retract” (European Court of Human Rights 1995).

Tolerance for rape in marriage, as well as rape laws that historically have protected the property interests of men over the personal safety of women, may partially explain why rape is so prevalent: each year in the United States nearly 100,000 forcible rapes are reported to police. This figure does not reflect the estimated 100,000 unreported forcible rapes committed against women each year in the United States, nor does it capture lesser-degree sexual assaults that do not meet the reporting criteria required for a charge of forcible rape.

Predictors of Criminal Behavior
Contrary to the efforts of hard-line positivist criminologists who seek to identify biological traits that predispose people to criminal behavior, and rational-choice theorists who suggest people commit crimes of their own free will,
the consensus among most criminologists is that sociological factors play a significant role in producing criminal behavior. Criminological research has shown that there is no one socioeconomic factor that has proved an accurate predictor of criminal behavior. However, there are some variables that seem to affect the likelihood, volume, and type of crimes that occur in particular countries, regions, and communities. For traditional street crimes, socioeconomic variables such as median income, educational attainment and access to education, religion, family conditions (e.g., divorce and overall family cohesion), and job availability have been correlated with criminal behavior. Population density and the degree of urbanization, the concentration of youth in a community, community stability (e.g., population turnover rates and commuting patterns), alcohol and drug use, the strength of law enforcement agencies in a particular area, community attitudes toward law enforcement, and even climate and weather have all been shown to affect the number of and types of crime that occur.

Of all of these links, the correlation between alcohol and drug use and crime receives the greatest attention from both academicians and policymakers. According to the Bureau of Justice Statistics, 35 to 40 percent of all convicted offenders under the jurisdiction of U.S. corrections agencies were estimated to have been under the influence of alcohol when they offended. Alcohol use is widespread among those convicted of public-order crimes, the most common type of offense among those in jail or on probation. Among violent offenders, about 40 percent of probationers, local jail inmates, and state prisoners, as well as 20 percent of federal prison inmates, were estimated to have been drinking when they committed the crime for which they were sentenced. Comparatively, in a recent survey of jail inmates nearly 30 percent reported drug use at the time they committed their offense, and an estimated 16 percent of convicted jail inmates committed their offenses to get money for drugs. According to the National Survey on Drug Use and Health, about 40 percent of adults who were on parole, probation, or some other form of supervised release from jail were classified as drug dependents or drug abusers, compared to 9 percent of the general U.S. population (U.S. Department of Health and Human Services 2005).

In the United States, if recent incarceration rates remain unchanged, an estimated one of every fifteen persons will serve time in a prison during his or her lifetime. However, the lifetime chances of a person being sentenced to a prison term differ based on race, ethnicity, and gender. Men stand an 11.3 percent chance of going to prison, compared to a 1.8 percent chance for women. This dramatic difference remains in spite of the significant increases in rates of female criminality since the 1970s. Of even greater concern to criminologists are the differences that exist along racial and ethnic lines. In 2001, approximately 65 percent of U.S. state prison inmates belong to a racial or ethnic minority. African Americans have an 18.6 percent chance of going to prison, Hispanics have a 10 percent chance, and whites have a 3.4 percent of serving time in a prison. Based on current rates of first incarceration, an estimated 32 percent of black males will enter state or federal prison during their lifetime, compared to 17 percent of Hispanic males and 5.9 percent of white males (Bureau of Justice Statistics).

**INADEQUACIES OF THE U.S. CRIMINAL JUSTICE SYSTEM**

It comes as no surprise to most criminologists that the U.S. criminal justice system is not an effective tool in preventing crime. One reason for this lies in the uncoordinated structure of the system itself. As Barkan and Bryjak note in *Fundamentals of Criminal Justice*, “the U.S. criminal justice system is only partly a ‘system’ as usually defined. ‘System’ implies a coordinated and unified plan of procedure. Criminal justice in the United States is only partly coordinated and unified . . . . the U.S. criminal justice system is really thousands of systems” (p. 7). Another reason the criminal justice system is largely incapable of preventing crime is that law enforcement, courts, and corrections are reactive institutions; they respond to crimes already committed rather than addressing the root causes of criminal behavior before they fester into crime. This is not a condemnation of the efforts of law enforcement or corrections officers: the criminal justice system simply does not have the resources, expertise, or capabilities to deal with most predictors of criminal behavior.

Politicians and the public present another obstacle in effectively addressing crime. For many reasons, including sensationalized accounts of crime in news and entertainment media, the inability of academics to package criminological research in a publicly palatable fashion, fear promoted by opportunistic political figures, and the unwillingness or inability of the public to inform themselves on crime and justice issues, the public has a distorted image of the crime problem in the United States (Reiman 2003). This distorted image leads to ill-advised, impractical, and ineffective criminal justice policies such as “three-strikes” laws (laws requiring prison terms of 25 years or more for offenders convicted of their third felony or serious crime), mandatory minimum sentencing, and the mandatory charging of juveniles as adults for certain offenses. These policies appeal to politicians because it allows them to appear to be “tough on crime” and makes the public think that the justice system is working. However, these policies represent knee-jerk responses to complex problems of crime; they divert resources from other approaches that carry a greater likelihood of success,
and they take discretion away from sentencing judges and other criminal justice practitioners who have a more accurate sense of the crime problem. Ultimately, the onus falls upon members of the academic community to debunk crime myths, dispel stereotypes regarding deviant groups, and promote responsible criminal justice policy.

CRITICAL LEGAL STUDIES

SEE Critical Race Theory.

CRITICAL RACE THEORY

Critical race theory is an intellectual and political movement within legal studies to transform the legal academy in terms of its analysis of racial inequalities and use the law to transform society in markedly antiracist directions. The intellectual breadth of critical race theory presages a much larger contribution to the social sciences aimed at understanding race relations in more interdisciplinary manners. Arising from the critical legal studies movement, critical race theory is identified in terms of two separate origins stories. Kimberlé Crenshaw (Crenshaw et al. 1995, 2002) identifies its origins in the work of Derrick Bell and the Harvard Law School. Sumi Cho and Robert Westley (2002) identify the development of critical race theory on the West Coast and the law school of the University of California Berkeley, Boalt Hall, and the free speech and Third World student movements that gripped college campuses in the 1960s.

Crenshaw, Richard Delgado, and Angela Harris identify the official beginning of critical race theory (CRT) in
1989, with the first workshop on the topic held in Madison, Wisconsin. Many of the scholars associated with critical race theory attended this and subsequent workshops. The impetus for a gathering of law faculty and students of color was their shared frustration over the colorblind veneer of critical legal studies.

Critical legal studies and critical race theory share a commitment to understanding the role that law plays in shaping social relations. Challenging the centrist model of jurisprudence that assumes law to be a self-contained, objective, rational entity designed to make maximally efficient decisions under the rule of law, critical legal studies scholars argue that law often structures social inequalities. Law operates like a bureaucratic iron cage that limits equal access and shapes economic and political hierarchies in society.

Focusing specifically on racial inequalities, critical race theory scholars share a commitment to viewing the law as exacerbating inequalities while maximizing its transformative potential. The foremost scholar in critical race theory is Derrick Bell, whose legal storytelling method has shifted scholarly boundaries between fiction and nonfiction, autobiography and legal analysis, legal and social science scholarship, and law and society. Bell’s And We Are Not Saved (1987) and Faces at the Bottom of the Well (1992) feature the fictional character Geneva Crenshaw, a civil rights lawyer who enters into a dialogue with Bell the law professor on the role that race continues to play in a post–civil rights era. Similar dialogues have been composed by Richard Delgado and his fictional student Rodrigo in The Rodrigo Chronicles (1995) and The Coming Race War! (1996).

For Crenshaw, the origins of the 1989 critical race theory workshop rest in the Harvard Law School and Bell’s decision to leave Harvard over the law school’s unwillingness to tenure a woman of color. The Alternative Course was a course on civil rights, race and law designed to continue Bell’s intellectual legacy and push to diversify a homogeneously white, male faculty. Harvard law students of color fought hard through the 1980s to study race from a critical perspective and diversify the law school’s students, faculty, and curriculum.

Other legal scholars, particularly Cho and Westley, identify the origins of critical race theory in the Free Speech and Third World consciousness-raising student movements of the 1960s. Particularly on the West Coast, university students from a plurality of minority communities came together to challenge the white, male patterns of privilege and reproduction. Harvard was not the only law school where students challenged the patterns of racial exclusion. The Boat Coalition for a Diversified Faculty orchestrated the Nationwide Law Student Strike on April 6, 1989, to publicize the dearth of faculty of color at the nation’s law schools (30 percent had never hired a faculty member of color, and 34 percent had made only a token or single hire as of 1981).

Today, many of the most influential law professors identify with critical race theory or its progenies. Derrick Bell, Sumi Cho, Kimberlé Crenshaw, Jerome Culp, Richard Delgado, Neil Gotanda, Lani Guinier, Ian Haney Lopez, Angela Harris, Kevin Johnson, Charles Lawrence, Mari Matsuda, Margaret Montoya, Michael Olivas, Robert Westley, Alfreda Robinson, Dorothy Roberts, Mary Romero, Jean Stefancic, Francisco Valdes, Patricia Williams, Robert Williams, and Eric Yamamoto are widely recognized scholars associated with critical race theory. This list is clearly not exhaustive but simply illustrative of a few of the many names associated with the intellectual movement.

Critical race theory finds its most influential, current expression in the New York University Press’s Critical America Series, edited by Delgado and Stefancic. Critical race theory is also cultivating offshoots that are blossoming into their own research programs. Current offshoots include: LatCrit, addressing Latinos, law, and identity; OutCrit, addressing the legal predicaments of lesbian, gay, bisexual, and transgender communities; critical race feminism, which takes an intersectional approach to law, race, and gender; NatCrit, addressing Native Americans and law; ClassCrit, addressing social class and law; critical white studies, challenging white privileges inscribed in law; and mixed-race crit, addressing law from biracial and multiracial identities.

The topics of inquiry in critical race theory vary but include hate speech, hate crimes, reparations, diversity in higher education and the legal academy, racial categorizations and law, identities theorized in relation to anti-essentialisms and multi-positionalities, corporate social responsibility, immigration enforcement, racial profiling, civil rights legislation, race-based backlash, and retrenchment. Many CRT scholars were instrumental in the successful reparations claim on the part of Japanese American internees. Reparations for African Americans (based on slavery and Jim Crow institutions), Native Americans (artifacts, land, and treaties), Mexican Americans (for mass repatriation during the Great Depression and the temporary worker or Bracero Program from 1942 to 1964), and Jewish Holocaust survivors represent critical race theory movements where law and politics intersect to advocate for social change.

The contributions to the social sciences include new approaches to narrative inquiry, the legal storytelling tradition, identities, and politics. The narrative storytelling tradition and its validation in the academy serve as major contributions not only to legal studies but to most fields of the humanities and social sciences. The fundamental
Critical Theory

epistemological claims of whose knowledge is deemed valid, how we come to “know truth,” and the privileged position of outsiders in understanding power relations are revolutionary contributions to an alternative philosophy of science that informs the social sciences.

Finally, fields such as education and interdisciplinary studies in law and society have incorporated critical race theory into their analytical frameworks. University of Wisconsin educators Gloria Ladson-Billings and William Tate’s 1995 call for the application of critical race theory to the fundamental issues of race in education has been answered by scholars such as Sofia Villenas, Tara Yosso, and Daniel Solórzano.

Critical Theory

The Frankfurt school of critical theory is one of the major schools of neo-Marxist social theory, best known for its analysis of advanced capitalism. Opposed to the determinism and scientism of Soviet Marxism, critical theory challenged the philosophical foundations of Marxist theory, and formulated an original analysis and diagnosis of the major changes in social structure that took place in the twentieth century.

The philosopher and social theorist Max Horkheimer (1895–1973) was appointed director of the Institute for Social Research in 1930, and shifted its emphasis from historical research to a project of interdisciplinary social research with an empirical intent. Horkheimer wanted to know why the working class supported the Nazi regime when it was not in their interest to do so. He rejected the deterministic view that consciousness was a product of class position, and looked to integrate psychology, more specifically Sigmund Freud’s (1856–1939) psychoanalysis, into a critical theory of society. To carry out his research program, Horkheimer brought into the institute Erich Fromm (1900–1980), a trained psychoanalyst, who fused psychoanalysis with social theory. Horkheimer further expanded the focus of research to include Leo Löwenthal (1900–1993), Herbert Marcuse (1898–1979), later Theodor Adorno (1903–1969), and the lesser-known figures Frederich Pollock (1894–1970), Franz L. Neumann (1900–1954), and Otto Kirchheimer (1905–1965).

The psychological dynamics of rising authoritarian attitudes were the focus of the institute’s early empirical research. A larger project that included the study of working-class attitudes toward authority remained uncompleted when the institute fled Germany to avoid the Nazis and went first to Switzerland and then was relocated at Columbia University in New York.

The term critical theory is often thought of as a code word to avoid the association of the institute’s research with Marxism. Critical theory, however, also drew upon German idealism from Immanuel Kant (1724–1804) onward. Kant saw critique as a theory of the scope and limits of understanding that combatted dogmatic conceptions of absolute knowledge. The Hegelian tradition came to see critique as a reflective self-consciousness that encompassed both self and social formation in one grasp. Both were crisis-ridden processes of struggle in which humans won their freedom through freedom from necessity and social domination.

Horkheimer rejected the idealism of G. W. F. Hegel’s (1770–1831) conception, but saw critical theory as a philosophy of engaged theorizing. Traditional theory took an objective observer perspective. It saw the ideal of theory construction as the achievement of a deductive system of propositions that are systematic and logical. In contrast, critical theory has an interest in freedom from unnecessary constraint and the improvement of practical life. It is a partisan in the struggle for a better life. Theory is tied to emancipation and freedom. Marcuse especially emphasized the Hegelian elements found in Karl Marx’s (1818–1883) early manuscripts (then just discovered) and their link to problems of alienation and reification.

The second phase of critical theory, which began at the end of the 1930s, was concerned with the great transformations in economic structure that were occurring in advanced capitalist and socialist societies, such as the rise
of state capitalism. Critical theory linked the increasing concentration of economic power by large corporations and government to the need for state administrative activity to support a crisis-ridden economy. Governments were not watchman states. They had to intervene directly in the economy to assure the conditions of successful economic accumulation.

The Frankfurt school analysis of late capitalism, however, went beyond economic analysis to depict state intervention in socialization processes. Intervention in social processes like schooling and social welfare became necessary in order to effectively manage state capitalism. The school also analyzed the emergence of mass media, which developed sophisticated modes of persuasion and manipulation in order to create a more compliant and agreeable citizenry. The Frankfurt school developed a pessimistic diagnosis of the power of advanced capitalism to control the populace and limit the possibilities of constructive social transformation.

The culmination of this stage was the publication of Horkheimer and Adorno’s *Dialectic of Enlightenment* (1944). Here, critical theory becomes a critique of instrumental reason. For Horkheimer and Adorno, reason (and science) no longer retained its link to human freedom, and had, in becoming instrumentalized, transformed into a force for domination and oppression. Marx’s thought itself, and not merely its orthodox deformations, were sometimes guilty of a technological determinism. Horkheimer and Adorno, however, unlike some post-structuralists, never fully rejected reason, or looked to a realm of the ineffable or irrational, but were keenly aware of the paradoxes and contradictions of modern instrumental rationality.

Horkheimer and Adorno looked to other dimensions of reason that were resistant to the forces of instrumental rationalization, notably to art, to find potentials for freedom. A somewhat different and more positive evaluation of the role of mass culture and art was developed by Walter Benjamin (1892–1940), a literary theorist who, though marginal in the institute, came to exert a strong influence on Adorno’s aesthetic theory.

Adorno’s work eclipsed Horkheimer after their return to Germany in 1950. In *Negative Dialectics* (1966) and *Aesthetic Theory* (1970), Adorno formulated a critique of reason using the power of the negative. The latter equated rationalization with reification. Positive reason, which always has a residue of instrumentality, is contrasted with a dimension of reason that can never be fully specified but holds truth content.

In the United States, Marcuse made some significant contributions to critical theory in the 1950s and 1960s. Marcuse’s *Eros and Civilization* (1955) was perhaps the school’s most successful fusion of Marx and Freud. Marcuse developed a dialectic of civilization that linked labor and economic scarcity with social and psychic repression. Marcuse’s acceptance of the death instinct, however, was controversial. His *One-Dimensional Man* (1964) and *An Essay on Liberation* (1969) continued the Frankfurt school’s critique of the pathology of technological reason. One-dimensional reason represented a global project of instrumental reason that suppressed the aesthetic aspects of sensibility and feelings. Marcuse’s more politically charged version of the dialectic of enlightenment struck a chord with the New Left in the United States and Europe.

Jürgen Habermas is the preeminent figure in the second generation of critical theory. Habermas modified key aspects of critical theory, especially the critique of instrumental reason, and made significant contributions to a critical theory of democracy, a task neglected by earlier theorists. Habermas’s first book, *Structural Transformation of the Public Sphere* (1962), took issue with the first-generation reading of the freedom-creating potentials of liberalism. Habermas depicted the rise of a sphere of civil society in early modern Europe as a public sphere of free discussion of political affairs. While Habermas concurred in broad terms with the critique of instrumental reason, he did not equate rationalization with reification. Habermas argued that instrumental reason had a legitimate role and was not inherently repressive. Reliance on technical expertise leaves out the elements of public debate and discussion.

In *Knowledge and Human Interests* (1968), Habermas reformulated Horkheimer’s idea of emancipatory social theory. Habermas developed three distinct cognitive interests—instrumental, communicative, and emancipatory—and rejected the idea that critical reason is found in negation alone. Returning to a more Hegelian-perspective critique requires an intersubjective process of understanding that emphasizes critical reflection on the formative processes of self and society. The emancipatory interest is a form of reflection on coequal processes of social formation (instrumental and communicative) that frees action from domination.

*Theory of Communicative Action* (1981) was the first systematic statement of Habermas’s mature theory of society. The cognitive interests were replaced by a broadly interpretive social theory that distinguishes two basic forms of social action: instrumental and communicative. The first is action oriented toward success. The second is action oriented toward mutual understanding.

Habermas’s revision of Marx centers on the conflict between intersubjective forms of understanding and the imposition of system imperatives on social life. In complex modern societies, some functions, such as the economy, have become detached from moral and political
regulation in order to efficiently carry out social reproduction. However, in capitalism this rationalization process is one-sided. It replaces realms of communicative action that are constitutive of human subjectivity and intersubjectivity with system imperatives. Habermas coined the phrase “colonization of the life world” to indicate the way in which these communicative spheres are controlled and reified by instrumental and functional imperatives. Reification involves threats to the integrity of communicative subjectivity in the contradictions between democracy and capitalism in modern society.

Most of Habermas’s later work has focused on the formation of a cosmopolitan legal, moral, and political theory. This emphasis maintains a tenuous link to emancipatory theory and social crisis. Habermas’s discourse ethics revises the Kantian principle of universalization in light of intersubjective aspects of communicative rationality. Kant’s categorical imperative applies to the individual who reflects by himself or herself. It asks us to “act only according to a maxim by which you can at the same time will that it shall become a general law” (Kant, 39). In contrast, Habermas’s discourse ethics requires a social, intersubjective perspective. Participants have to reflect on the consequences for all those potentially affected by a norm: “for a norm to be valid, the consequences and side effects of its general observation for the satisfaction each person’s interests must be acceptable to all” (Lenhardt and Nicholson, 197). The only norms that can be valid are those which can be accepted by all participants in discourse.

In Between Facts and Norms (1992), Habermas extends the communicative basis of discourse theory to democratic constitutionalism. Communicative freedom in Habermas’s view incorporates aspects of liberal democracy and republican theory. It stresses the self-determination emphasized by liberal theory and the self-realization of republican theories.

Many critics also see Habermas’s moral and political theory as a return to a Kantian moral theory. It can, however, also be viewed as an attempt to fuse Kantian insights into Hegelian notions of concrete intersubjectivity. In addition, post-structuralists reject the idea of an inclusive intersubjective foundation for ethics, politics, and law. For Jacques Derrida (1930–2004), for example, law is a closed system instituted through violence. Genuine intersubjectivity is rooted, in contrast, in care and compassion for the other, which is always beyond law and justice. On this reading, Habermas replays the earlier notion of a unified social subject. Habermas’s use of systems theory in Theory of Communicative Action has also been criticized by interpretive social theorists who believe that Habermas’s theory of society is inconsistent with his general commitment to interpretive and critical social science.

**Croatians**

Croatians are a Slavic people, but theories of their origins are widely disputed. The most widely accepted “Slavic” theory of the origin of the Croats traces their migration starting in the seventh century from the area north of the Carpathian Mountains into the western Dinaric Alps. Croats are predominantly Roman Catholic. The name Hrvat (Croat) was recorded for the first time on the Adriatic coast in 852.

The earliest Croatian state was the Principality of Dalmatia. In 925 the Croatian duke of Dalmatia, Tomislav of Trpimir, united all Croats. He organized a state by annexing the Principality of Pannonia. Throughout history, Croats were subjected to forced Magyarization as well as Germanization. After World War I, most Croats united within the Kingdom of Slovenes, Croats, and Serbs. The state was transformed into the Kingdom of Yugoslavia in 1929, and the Croats became part of a new nation called the Yugoslavs or South Slavs. In 1939 the Croats attained a high degree of autonomy when the Banovina of Croatia was created, which united almost all ethnic Croatian territories within the kingdom. During World War II, the Axis created a puppet state—the State of Croatia, led by fascists whose goal was an ethnically clean Croatian state. At the same time, many Croats joined the antifascist partisan movement led by the Communist Party of Yugoslavia.

Croats have maintained a strong culture and sense of national identity, and the Roman Catholic Church has contributed to this significantly. The most distinctive features of Croatian folklore include *klapa* of Dalmatia (*klapa*, meaning “company” or “ensemble,” refers to folksinging groups) and the orchestras of Slavonia. Folk arts are performed at special events and festivals.

In the early twenty-first century, in addition to their homeland, where about 4 million Croats live, 600,000 Croats live in Bosnia and Herzegovina, while 100,000 to 200,000 live in other states of the former Yugoslavia. The largest immigrant groups live in western Europe, primarily Germany, Italy, and Sweden. Outside Europe, Croats live in the United States and Canada as well as in Argentina, Chile, Peru, and Bolivia. The earliest Croatian settlement in America is dated to 1573, when a peasant uprising was crushed in Croatia and many of them left. There are also large Croatian communities in Australia, New Zealand, and South Africa.

The Croatian national identity, which was suppressed in the name of the preservation of an overarching Yugoslav national identity during the cold war, experienced a new resurgence and played a crucial role in Croatia’s involvement in the Yugoslav war in the 1990s. This resurgence of Croatian nationalism and the desire for the creation of a nation-state caused the rebirth of historical ethnic tensions with the neighboring Serbs. Part of the reemergence of the national identity was the Croat campaign to distinguish Croatian as a language separate from the previously united Serbo-Croatian language.

CRONY CAPITALISM

The term crony capitalism refers to forms of capitalism in which leading businessmen enjoy close personal relationships with key politicians. Crony capitalism is often associated with corruption and many commentators have seen it as a major obstacle to Third World development. Commentators often contrast crony capitalism with highly idealized neoclassical models of capitalism. In actuality, however, significant linkages between political elites and business classes can be found in almost all capitalist regimes, past and present, and the real task is to identify the variety of ways in which such linkages either facilitate or hinder economic development.

In many underdeveloped countries crony capitalism may be perceived both as corrupt and as antinational. Crony capitalists often belong to ethnic minority groups whose activities have been historically concentrated within the business or financial sector and who in some cases had enjoyed protection under earlier colonial regimes. As in the cases of the Lebanese in Sierra Leone, Indians in Kenya, and the Chinese throughout Southeast Asia, perceived government favoritism toward entrepreneurial minorities may lead to fierce ethnic conflicts and the shattering of polities.

Crony capitalism may result in corruption. But corruption's effects on economic development need not necessarily be lethal and corruption is certainly not unique to modern Third World nations. While the World Bank and the U.S. government have intervened to make aid conditional on struggles against corruption, relatively little attention has been given to historical studies of the effects of corruption on economic development. American civic life in the era of the Second Industrial Revolution between 1870 and 1914 was immensely corrupt, though the effect of this corruption on U.S. economic growth remains largely unexplored. In _The Shame of the Cities_ (1902) the social reformer Lincoln Steffens documented many cases of corrupt ties between businessmen and politicians during the era of the so-called Robber Barons. Steffens condemned the “shamelessness” of municipal politics in St. Louis, a politics characterized by “government of the people, by the rogues and for the rich.” Recent examples of cronyism show that the spirit of the Robber Barons continues: In 2001 the Enron case revealed collusion between politicians and corporate executives, while 2006 saw the conviction of the lobbyist Jack Abramoff, who had served as an intermediary between businessmen and key congressmen.

Some sociologists and political scientists have even maintained that some forms of crony capitalism may be indispensable for capitalist development, particularly when those forms of cronyism help prevent untrammeled corruption. As modern China shows, personal political networks tying central government leaders to regional industrialists may be invaluable in combating entrepreneurial corruption. China’s increased movement away from state-owned enterprise has greatly increased opportunities for corruption at the higher ranks of society. Interestingly, however, the emerging Chinese culture of corruption so far seems mainly limited to regional levels, as the political elite that rules China at the national level has resisted absorption into this culture. Much of the success of the current Chinese economy may be due to the combination of local businessmen adept at adapting laws to local conditions and an uncorrupted political elite with ties to regional economic leaders that imposes limits on regional corruption and maintains a legal framework on which local and foreign businessmen can rely.

Cronyism has been an important element of capitalism everywhere, but the relationship between cronyism, business, and politics and cronyism’s effect on development vary greatly from nation to nation.

CROSS OF GOLD

In a passionate speech to the Democratic national convention on July 9, 1896, William Jennings Bryan (1860–1925) used the “cross of gold” metaphor to attack the U.S. gold standard and defend the “free coinage of silver.” Bryan’s nomination as the presidential candidate of the Democratic Party made the national currency the central issue of the fall election. Bryan’s defeat in the landmark 1896 election ushered in a new political era in American politics.

The federal government had begun to restrict the supply of money in the United States after the Civil War (1861–1865). In 1879 the U.S. government effectively adopted the gold standard, pegging the value of the dollar to a fixed amount of gold. In a nation with a growing pop-

Crony capitalism is often associated with corruption and many commentators have seen it as a major obstacle to Third World development. Commentators often contrast crony capitalism with highly idealized neoclassical models of capitalism. In actuality, however, significant linkages between political elites and business classes can be found in almost all capitalist regimes, past and present, and the real task is to identify the variety of ways in which such linkages either facilitate or hinder economic development.

In many underdeveloped countries crony capitalism may be perceived both as corrupt and as antinational. Crony capitalists often belong to ethnic minority groups whose activities have been historically concentrated within the business or financial sector and who in some cases had enjoyed protection under earlier colonial regimes. As in the cases of the Lebanese in Sierra Leone, Indians in Kenya, and the Chinese throughout Southeast Asia, perceived government favoritism toward entrepreneurial minorities may lead to fierce ethnic conflicts and the shattering of polities.

Crony capitalism may result in corruption. But corruption’s effects on economic development need not necessarily be lethal and corruption is certainly not unique to modern Third World nations. While the World Bank and the U.S. government have intervened to make aid conditional on struggles against corruption, relatively little attention has been given to historical studies of the effects of corruption on economic development. American civic life in the era of the Second Industrial Revolution between 1870 and 1914 was immensely corrupt, though the effect of this corruption on U.S. economic growth remains largely unexplored. In _The Shame of the Cities_ (1902) the social reformer Lincoln Steffens documented many cases of corrupt ties between businessmen and politicians during the era of the so-called Robber Barons. Steffens condemned the “shamelessness” of municipal politics in St. Louis, a politics characterized by “government of the people, by the rogues and for the rich.” Recent examples of cronyism show that the spirit of the Robber Barons continues: In 2001 the Enron case revealed collusion between politicians and corporate executives, while 2006 saw the conviction of the lobbyist Jack Abramoff, who had served as an intermediary between businessmen and key congressmen.

Some sociologists and political scientists have even maintained that some forms of crony capitalism may be indispensable for capitalist development, particularly when those forms of cronyism help prevent untrammeled corruption. As modern China shows, personal political networks tying central government leaders to regional industrialists may be invaluable in combating entrepreneurial corruption. China’s increased movement away from state-owned enterprise has greatly increased opportunities for corruption at the higher ranks of society. Interestingly, however, the emerging Chinese culture of corruption so far seems mainly limited to regional levels, as the political elite that rules China at the national level has resisted absorption into this culture. Much of the success of the current Chinese economy may be due to the combination of local businessmen adept at adapting laws to local conditions and an uncorrupted political elite with ties to regional economic leaders that imposes limits on regional corruption and maintains a legal framework on which local and foreign businessmen can rely.

Cronyism has been an important element of capitalism everywhere, but the relationship between cronyism, business, and politics and cronyism’s effect on development vary greatly from nation to nation.

CROSS OF GOLD

In a passionate speech to the Democratic national convention on July 9, 1896, William Jennings Bryan (1860–1925) used the “cross of gold” metaphor to attack the U.S. gold standard and defend the “free coinage of silver.” Bryan’s nomination as the presidential candidate of the Democratic Party made the national currency the central issue of the fall election. Bryan’s defeat in the landmark 1896 election ushered in a new political era in American politics.

The federal government had begun to restrict the supply of money in the United States after the Civil War (1861–1865). In 1879 the U.S. government effectively adopted the gold standard, pegging the value of the dollar to a fixed amount of gold. In a nation with a growing pop-
ulation and an expanding economy, this restrictive monetary policy helped force prices downward. Prices for agricultural commodities fell dramatically from the late 1860s to the late 1890s. Falling prices created hardship for many farmers, especially in the South and West. Indebted farmers in these areas resented the flow of capital to creditors in northeastern cities. Naturally, these farmers blamed the gold standard as the reason for their problems. They demanded that the government circulate more currency to alleviate these pressures. At first, they urged the government to support “greenback” (paper) dollars. By the 1870s, they were insisting on the “free coinage” of silver, that is, the circulation of silver and silver-backed currency, valued at a sixteen to one ratio to gold-backed currency. Their resentment of the gold standard fueled the growth of the populist movement in the late 1880s and the 1890s.

The economic depression of 1893 discredited gold supporters in the Democratic Party because it occurred during the presidency of Democrat Grover Cleveland (1837–1908), a staunch defender of the gold standard. The successes of the silver-supporting People’s Party in the 1892 election strengthened the influence of Democrats who supported silver in 1896. During a crucial convention debate over the currency plank at the 1896 Democratic national convention, thirty-six-year-old Bryan, a silver supporter and former U.S. representative from Nebraska, gave an electrifying speech for silver. Bryan insisted to gold supporters that “you shall not press down upon the brow of labor this crown of thorns, you shall not crucify mankind upon a cross of gold.” Nominated for president on the fifth ballot, Bryan ran a campaign of unprecedented energy, traveling eighteen thousand miles and making over six hundred speeches. Gold standard supporters dominated the 1896 Republican convention and nominated Ohio governor William McKinley (1843–1901) for president, thus making currency the central issue of the election. Bryan lost the popular vote by 4 percent and the electoral college 271 votes to 176. Though Bryan won a wide swath of southern and western states, McKinley carried the more densely populated states of the Midwest and Northeast. The 1896 election revitalized and realigned the American party system, creating a “fourth party system,” in which Republicans dominated most national elections. During McKinley’s presidency, the U.S. formally adopted the gold standard.

**CROWDING HYPOTHESIS**

Societies have been stratified on the basis of income since ancient times. One of the main axes of stratification is the occupational hierarchy. Evidence of the nonrandom distribution of social groups among occupations is apparent in labor markets around the world (e.g., secretaries are disproportionately female). Social groups that are restricted from access to the range of occupations tend to concentrate in those occupations with the lowest economic rewards. For example in *Black Metropolis: A Study of Negro Life in a Northern City* (1993), St. Clair Drake and Horace R. Cayton noted that in 1930, 56 percent of black females in Chicago were servants of some kind.

The *crowding hypothesis* originated in the United States during the women’s union movement of 1890 to 1925. In 1922 British economist F. Y. Edgeworth (1845–1926) argued that women’s lower pay was explained by the fact that women crowded into a small number of occupations. Unions had excluded women from “men’s work,” causing an oversupply of female workers and reducing the price (wage) for their labor. Thus crowding was caused by institutional barriers that artificially distorted the operation of the labor market, resulting in lower wages for some groups and higher wages for others. The crowding hypothesis received little attention until 1971 when economist Barbara R. Bergmann published a pathbreaking paper called “The Effect on White Incomes of Discrimination in Employment.” She estimated that the integration of black male blue-collar workers into white occupations would have a negative effect on white male incomes. In 1974 Bergmann analyzed crowding among female workers and since then economists have considered occupational segregation by sex to be a major determinant of the gender disparity in wages.

The empirical evidence is clear that crowding benefits some groups by reducing competition for the most desirable occupations. This helps to explain why occupational segregation is so universal. The crowding hypothesis is simple yet very powerful because it employs the fundamental laws of economics, supply and demand, to explain intergroup wage disparity. Sir William Arthur Lewis
Crowding Hypothesis

(1915–1991), a Nobel-prize winning economist, stated in Racial Conflict and Economic Development (1985) that “The essence of discrimination is its measures to restrict relative numbers in higher paid occupations. Race is not a necessary factor; such measures are found even in homogenous societies” (Lewis 1985, p. 43). Discrimination occurs when devices such as unions and credentialing processes restrict entry; it becomes imbedded in the system and is not necessarily intentional. Lewis theorized that restrictions on access to preferred occupations can render groups noncompeting, making it easier to deny discrimination.

A critique of the crowding hypothesis is that crowding could arise from factors other than discrimination. Women may prefer jobs considered “women’s work,” such as the nurturing occupations of nursing and childcare. Human capital factors such as education and skill level may also influence crowding. Another critique is that market competition should eliminate crowding as profit-seeking employers replace high-wage workers with low-wage workers from crowded occupations. In “The Crowding Hypothesis” (2005) Timothy Bates and Daniel Fusfield reported little evidence of this. They consider racial crowding self-perpetuating because it traps workers in occupations requiring little skill and with high unemployment rates. Workers have little incentive to acquire skills and racial hostility is mutually reinforced—thus crowding is both the cause and effect of “racial antagonisms and the lack of human capital on the part of blacks and other minority groups” (Bates and Fusfield 2005, p. 109). The crowding hypothesis offers a most useful way to think about the problems of urban labor market structures (e.g., low wages, little training, and job insecurity) impacting low-income communities of color. Crowding plays an important role in the black unemployment rate, which has been double the white rate since the mid-1950s.

There is ample empirical evidence linking occupational crowding and lower wages, though most studies concern sex segregation. Estimates are that 12 to 37 percent of the U.S. gender wage gap is attributable to crowding. Analytical techniques for measuring this relationship have become more sophisticated to control for worker characteristics and adjust to data limitations, statistical bias, and other problems. Evidence from detailed, matched employer-employee datasets with sex, occupation, industry, and work establishment data supports the crowding hypothesis. Beginning in the 1970s women’s opportunities in white-collar and service employment widened. While black male and female occupational patterns (and wages) have improved as well, especially in public sector employment, white males still dominate high-skill blue collar occupations (e.g., carpenter). Blacks have made less progress in white-collar managerial and executive positions. In “Male Interracial Wage Differentials: Competing Explanations” (1999) Patrick L. Mason showed that wage discrimination accounts for 21 percent of the black male/white male wage differential and 17 percent of the Latino/non-Hispanic white male wage differential. However once the differences in the race-gender employment densities of the occupations are accounted for, the black male/white male unexplained wage differential declines to 7 percent, while the Latino/non-Hispanic white male unexplained wage differential declines to 11 percent. Hence crowding accounts for 14 percent of the black/white male wage differential and 6 percent of the Latino/white male differential. Further for all groups individual wages rise with white employment density, though white males receive the largest boost to individual wages.

Affirmative action policies have widened occupational choice for women and racial minorities. Continued occupational crowding, however, reveals the need for more rigorous enforcement of equal employment law. The notion of comparable worth (equal pay for different work) derives from the crowding hypothesis, but policies to achieve it are complicated and face stiff resistance. Some view economic growth as the most effective remedy, however this too has limits. Crowding is increasingly important as an impediment to equality and efficiency in a globalized economy.

CUBAN MISSILE CRISIS
Perhaps no single event in the history of the cold war presented as great a challenge to world peace and the continued existence of humankind as the thirteen days of the Cuban Missile Crisis in October 1962. The outcome of the crisis has been linked to the development of a direct Teletype “hotline” between Moscow and Washington, D.C., the initial stages of superpower détente, and the ratification of a bilateral atmospheric testing ban on nuclear weapons.

LEADING UP TO OCTOBER 1962
Despite the failed U.S. effort to overthrow Cuban dictator Fidel Castro during the Bay of Pigs invasion in April 1961, President John F. Kennedy continued to make Castro’s removal a primary goal. In November 1961, Kennedy initiated Operation Mongoose, a covert operations plan designed to incite dissident Cubans against Castro. Perhaps as a result, Castro, who enjoyed the Soviet Union’s political and military backing, began receiving regular covert shipments of Soviet arms, ostensibly for defensive purposes only.

SOVIET NUCLEAR MISSILES IN CUBA
On October 14, 1962, a U2 spy plane, flying a routine Strategic Air Command mission over Cuba, snapped a series of photographs that became the first direct evidence of Soviet medium-range ballistic nuclear missiles in Cuba. These missiles clearly constituted an offensive weapons buildup on the island.

The Quarantine
On the morning of October 16, National Security Adviser McGeorge Bundy presented a detailed analysis of the photographic evidence to Kennedy at an Oval Office briefing. Just before noon, Kennedy convened the first meeting of fourteen administration officials and advisers. The group became known as the Executive Committee of the National Security Council, or ExComm.

Time was of the essence. ExComm members received estimates that the Soviet missiles could be at full operation within fourteen days, with individual missiles readied within eighteen hours under a crash program. Most missiles were determined to be SS-4s, with a range of approximately 1,100 nautical miles (1,266 statute miles). This placed major American cities, including Dallas and Washington, D.C., within range of a strike. Later, photographic evidence concluded that several SS-5s, with a range of 2,200 nautical miles, were also included in the Soviet arms shipments.

For the next seven days, ExComm debated the merits of three general approaches to the developing crisis, all while keeping a tight public lid on the Cuban discovery. The first was a surgical airstrike targeting as many missile sites as possible. The second was an air strike followed by a U.S. military invasion of Cuba. The third was a blockade of Soviet ships thought to be carrying additional materials in support of the offensive weapons program.

In an attempt to allow diplomatic approaches an opportunity to work, Kennedy opted for the blockade, which was termed a quarantine so as to avoid warlike denotations.

THE QUARANTINE
On October 22, in anticipation of a Cuban and/or Soviet reaction to the quarantine, the joint chiefs of staff placed U.S. military forces worldwide on DEFCON 3 alert. At five that afternoon, Kennedy met with seventeen congressional leaders from both major parties to discuss the situation. The president received some support for the quarantine, but notable exceptions included Senators J. William Fulbright and Richard B. Russell, both of whom believed that the strategy would not compel the Soviets to abandon their missiles.

By six that evening, Secretary of State Dean Rusk met with the Soviet ambassador to the United States, Anatoly Dobrynin, and presented the ambassador with an advanced copy of Kennedy’s address. At seven, Kennedy addressed the American public in a seventeen-minute speech. His major objective, in addition to calling public attention to the Soviet missiles in Cuba, was to outline the U.S. response—the quarantine of all offensive military equipment under shipment to Cuba.

Soviet premier Nikita Khrushchev’s reply to Kennedy’s speech arrived on the morning of October 23.
Premier Khrushchev’s letter insisted that the Soviet missiles in Cuba were defensive in nature, and that the proposed U.S. response constituted a grave threat to world peace.

Kennedy was concerned that Berlin, which was divided into segments of East and West at the end of World War II, would become a focal point for Soviet retaliation. As such, he directed the Central Intelligence Agency (CIA) to develop plans for protecting Berlin in the event the Soviets mounted a quarantine around the city.

By the evening of October 23, Kennedy and ExComm had new worries much closer to home. Earlier in the day, the CIA began tracking several Soviet submarines unexpectedly moving toward Cuba. This made the Navy’s job of conducting the quarantine more complicated, as it now had to track the changing position of the Soviet subs in order to ensure the safety of its own vessels.

The quarantine, which received the unanimous backing of the Organization of American States, went into effect at 10:00 a.m. on October 24.

Early morning intelligence on that day suggested that sixteen of the nineteen Soviet cargo ships identified as Cuban bound were reversing course. The remaining three, however, were nearing the quarantine line, including the Gagarin and Komiles. Naval intelligence reported that one of the Soviet subs had taken a position between the two ships. Kennedy, though wishing to avoid conflict with the sub, authorized the aircraft carrier USS Essex to take whatever defensive measures were necessary against the submarine. This was perhaps the most dangerous moment of the cold war, as both superpowers were armed and mere moments from turning the war hot. Just prior to any armed hostilities, however, both Soviet ships stopped dead in the water, and eventually reversed course.

Realizing that a diplomatic resolution to the crisis was imperative, Kennedy and senior ExComm advisers began to consider offering the Soviets a missile trade. Specifically, if Khrushchev pulled his missiles out of Cuba, the United States would dismantle and remove its Jupiter missiles in Turkey.

RAISING THE STAKES
October 25 found the U.S. ambassador to the United Nations, Adlai Stevenson, publicly confronting the Soviet ambassador, Valerian Zorin, in front of the United Nations Security Council. The Soviet Union had, until this date, denied that offensive Soviet missiles were in Cuba. At this point, Stevenson showed the council, and the world, several reconnaissance photographs of the Cuban missiles.

This triumph was short-lived. By five that evening, CIA director John McCone reported to ExComm that some of the Cuban missiles were now operational.

By the morning of October 26, Kennedy was convinced that only an invasion of Cuba could succeed in removing the missiles. ExComm initiated preliminary civil defense measures for the American Southeast, while the State Department began to devise plans for establishing a new civil government in the wake of Castro’s deposing. By that afternoon, the U.S. military was poised to conduct a land invasion. Secretary of Defense Robert McNamara advised Kennedy to expect heavy American casualties in the campaign.

At six that evening, the State Department received a letter from Khrushchev proposing that the U.S. declare it would not invade Cuba in exchange for the Soviets dismantling the missiles. Later that evening, Attorney General Robert F. Kennedy, the president’s closest adviser and brother, held another in a series of private meetings with Dobrynin. It was at this meeting that Kennedy, with the president’s approval, began to specifically discuss the option of a Turkey-for-Cuba missile trade.

Any positive momentum from this meeting stalled on the morning of October 27. A second letter from Khrushchev arrived at the State Department around eleven. This letter replaced the noninvasion pledge with the requirement of a complete removal of U.S. missiles in Turkey. This raised the stakes for the Kennedy administration, as any public agreement on the Jupiter missiles would appear as a quid pro quo, with the U.S. forced to develop its security and foreign policies under severe threat.

The situation deteriorated even further when a U2, piloted by Major Rudolf Anderson, was shot down over Cuba around noon. Sensing that he was losing control of the crisis, Kennedy decided not to retaliate against the anti-aircraft site that fired on Anderson, much to the consternation of his military leaders.

At an ExComm meeting later that evening, the idea of responding only to the offer in Khrushchev’s first letter—the noninvasion pledge—while ignoring the terms of the second letter, was debated. President Kennedy eventually came to adopt the proposal. Robert Kennedy was sent to discuss the terms with Dobrynin, which included an agreement not to publicly disclose the Turkey-for-Cuba missile trade, so as to avoid the appearance of a quid pro quo.

MAXIMUM DANGER AVERTED
President Kennedy, while hopeful that a deal would be reached, activated twenty-four Air Force units in preparation for a Cuban invasion to occur no later than October 29.

A CIA update in the early morning of October 28 claimed that all MRBM sites in Cuba were now operational. At nine that morning, Radio Moscow broadcast
Khrushchev’s reply to the terms outlined to Dobrynin the night before. In it, Khruschev stated that all Soviet missiles in Cuba would be dismantled and crated. No public mention of the missile trade deal was made. The Cuban Missile Crisis was over, and a world war with nuclear weapons had most likely been averted.

Many historians generally view President Kennedy’s performance in the crisis as exemplary, and worthy of emulation by all chief executives. However, some revisionary scholars have criticized Kennedy’s interpretation of the threat posed by the Cuban missiles as an overreaction not warranted by a sober assessment of Soviet intentions and strategic goals.

UNDERSTANDING THE CRISIS

Of the many scholarly works devoted to understanding the dynamics of the missile crisis, and its effects on policymakers on both sides of the Atlantic, is Graham T. Allison and Philip Zelikow’s Essence of Decision (1999). This volume has perhaps the greatest continuing impact for scholars and other interested persons alike. Allison analyzes the crisis through three distinct models. Model One assesses foreign policy from the rational actor approach, which considers each state as an individual or person, and attempts to understand actor behavior according to specified risks and payoffs. Model Two examines the crisis from the vantage point of the individual agencies involved, while Model Three attempts to capture the individual interests and proclivities of the major players involved.

Allison and Zelikow use the unique exigencies presented by the crisis to suggest that the models are incompatible in understanding the strategic calculus between states. Yet their description leaves the models open to the argument that they are not able to account for the novel and immediate adaptations that events, such as the Cuban Missile Crisis, require of government actors. At the same time, it is not clear that there is much true difference between the models, especially two and three, as all three are steeped in the rational choice tradition. Thus, while the examination does help to shed some light on the internal dynamics inherent in government decision-making processes, the uniqueness of the Cuban Missile Crisis and the relative inability of the three models to capture the dynamics at work in both Washington and Moscow serve as a reminder of how critical, and potentially catastrophic, a period the thirteen days in October 1962 truly were.

CUBAN REVOLUTION

The Cuban revolution headed by Fidel Castro (b. 1926) began on January 1, 1959, after Cuban military dictator Fulgencio Batista (1901–1973) fled the country. Since that time Cuba has been headed by a nationalist, revolutionary government. The prime mover of the revolutionary process has been Fidel Castro himself, although his brother Raúl Castro took over in August 2006 when the 80-year-old president underwent major abdominal surgery.

THE SEEDS OF REVOLUTION

To understand the Cuban revolutionary process, it is necessary to appreciate the philosophy of Cuban patriot and writer José Martí (1853–1895), whose radical anti-imperialist thought was adopted by the Castro government several decades after Martí’s death. Martí was the leader of the movement for Cuban independence from Spain and was killed in battle in 1895. It is also crucially important to bear in mind the United States’s role in Cuba. After Martí was killed fighting against Spanish forces, the war for Cuban independence dragged on for three more years. Under U.S. president William McKinley (1843–1901), and following the destruction of the USS Maine in Havana harbor, U.S. troops intervened, and three months later Spanish forces surrendered. This liberation war (1868–1878, and 1895–1898) is often referred to as the “Spanish American War,” an act of historical oversight, since the name ignores the Cuban role in the struggle for independence and the death of over 200,000 Cubans.

From 1899 to 1902 the U.S. military ran the country, under the leadership of two American generals. U.S. investment grew quickly in agriculture, banking, mining,
Cuban Revolution

transportation, and utilities, and by 1911 U.S. investment had reached about $200 million. U.S. military intervention also occurred on several occasions, to shore up governments friendly to Washington. The end result was a profound frustration among many Cubans with U.S. domination of the political and economic systems. This combination of the radical thought of José Martí and a sense of frustrated nationhood brought about the overthrow of Cuban dictator Gerardo Machado (1871–1939) in 1933, and it would later result in the downfall of Batista in 1958.

Fidel Castro was already well known in Cuba before 1959. He had been a candidate for political office in 1952, though those elections never took place since Batista mounted a military coup. Afterwards the young Castro decided to use arms as a means of taking power and attacked the second largest military garrison in Santiago, Cuba, on July 26, 1953. Castro was arrested, but his prison sentence was commuted in an amnesty given by Batista, a costly mistake for the dictator. Castro laid out many of his basic tenets in his defense speech at trial (later published as History Will Absolve Me). After his trial Castro left for Mexico where he trained approximately eighty men (including Argentine physician and revolutionary leader Ernesto “Che” Guevara [1928–1967] and his brother Raúl Castro), and on December 2, 1956, they arrived in Cuba in a small yacht called the Granma. Castro and his followers took to the mountains where they fought a relentless guerrilla campaign until December 31, 1958, when Batista fled Cuba.

CASTRO SEIZES POWER

There has been much debate as to the nature of the political thought of Fidel Castro when he took over as leader of Cuba in 1959. For some he was a committed Marxist, determined to install a Communist dictatorship in Cuba. Others saw him as a nationalist radical, intent on bringing social justice to Cuba after another mammoth struggle in which an estimated 30,000 were killed—many as the result of acts of barbarism by Batista’s forces.

There were several stages in the revolutionary process. The initial years witnessed a political radicalization, with massive social divisions appearing. The revolutionary government brought in sweeping legislation to protect the weakest sectors of society—reforms that were introduced at the expense of the middle class. Of the population of almost six million in 1958, approximately 10 percent formed a powerful middle class, who came second only to Venezuela in terms of per capita income and lifestyle.

Meanwhile, while Havana boasted that in 1954 it sold more Cadillacs per capita than any city in the world, rural Cuba suffered. Some 25 percent of the total labor force worked only 100 days annually (mainly in the sugar industry) and lacked many basic amenities. The urban-rural division was a major factor for many Cubans in supporting the revolution: rural illiteracy, for example, was four times that found in cities, while only 9 percent of rural homes—compared with 87 percent in the cities—had electricity.

The period from 1959 to 1961 was accompanied by social, economic, and political reforms—mainly realized at the expense of the wealthy middle-class sectors. The nationalization of many businesses, a sweeping land reform, an urban reform law, legislation protecting the rights of Afro-Cubans, closure of private schools, and criticism of the influential Catholic Church and opposition media, all resulted in a broad social polarization. Many U.S. businesses were expropriated, and Washington responded by breaking diplomatic relations with Cuba in January 1961.

THE GOLDEN YEARS

After this rupture the revolutionary process appeared in dire straits. Cuba’s major export product, sugar, went to one major client—the United States. It appeared only a matter of time before the revolution crumbled. But the cold war with the Soviet Union and the United States was about to warm up considerably, with Moscow arranging to buy all of Cuba’s sugar, and to provide arms, industrial training, technology, investment, and aid to Cuba. This arrangement of increasingly close Cuban-Soviet cooperation continued until the implosion of the Soviet Union in 1989–1990.

In many ways the cooperation with the Soviet Union and other socialist countries constituted the golden years for the Cuban revolution. Generous subsidies (approximately $4 billion per year) flowed in, Soviet technology was installed, and military protection was effectively guaranteed. This was seen as being particularly important after the U.S.-sponsored invasion of Cuba by Cuban exiles in April 1961 (known as the Bay of Pigs) and the October 1962 Cuban Missile Crisis, when Soviet nuclear weapons in Cuba were dismantled after enormous international tension brought the world to the brink of nuclear war.

At this time Cuba was largely isolated in international circles, being suspended from the Organization of American States, and ignored by most members of NATO. Gradually, however, Havana was able to make alliances with nations in the developing world, many of whom respected the cooperation that the Castro government provided. In 2006 Cuba reached the zenith of this international support, with its motion condemning the U.S. embargo of Cuba winning the support of 183 countries (with 4 voting against, and 1 abstention). Also in that year Cuba took over as the elected leader of the Non-Aligned Movement (representing countries with 60 per-
CULTS

The term cult is derived from a Latin root meaning “to break ground,” particularly in preparing (cultivating) a field for domesticated crops. The same root is seen in culture, in both a specialized scientific sense (a bacteria culture) and in a broader social sense (human culture). By extension, it was originally used in a religious sense, meaning behavior glorifying a deity or saint (the “cult” of Saint James). By the nineteenth century, the word came to be

CUBA TODAY

Following the demise of the Soviet Union, the Cuban revolution faced major challenges. Again Cuba had to find new markets for its goods, but also it now had to retool its industries, find suppliers for its factories, secure fuel—and it had to do so in a harsh international capitalist market. After some five extremely difficult years, the economy bottomed out, but it has grown annually since 1994. In no small measure this is due to a series of economic reforms, including the legalization of hard currency, the promotion of joint ventures with foreign capital, and the development of the tourism industry. An exchange program with Venezuela—which provides 90,000 barrels of oil per day in return for the medical services of 20,000 Cubans—has also proved beneficial.

The radical thought of José Martí in the late nineteenth century, the resentment of U.S. control, and the subsequent profoundly rooted nationalism, all came together to produce a leader who has held center stage in Cuban politics for five centuries. Despised by a vocal minority (most of whom have voted with their feet and are living in exile), Fidel Castro has acted as a lightning rod for social change in Cuba, a process that has brought about a revolutionary socialist society and which to the present has survived against all odds.

Again Cuba had to find new markets for its goods, but also it now had to retool its industries, find suppliers for its factories, secure fuel—and it had to do so in a harsh international capitalist market. After some five extremely difficult years, the economy bottomed out, but it has grown annually since 1994. In no small measure this is due to a series of economic reforms, including the legalization of hard currency, the promotion of joint ventures with foreign capital, and the development of the tourism industry. An exchange program with Venezuela—which provides 90,000 barrels of oil per day in return for the medical services of 20,000 Cubans—has also proved beneficial.

The radical thought of José Martí in the late nineteenth century, the resentment of U.S. control, and the subsequent profoundly rooted nationalism, all came together to produce a leader who has held center stage in Cuban politics for five centuries. Despised by a vocal minority (most of whom have voted with their feet and are living in exile), Fidel Castro has acted as a lightning rod for social change in Cuba, a process that has brought about a revolutionary socialist society and which to the present has survived against all odds.

CULTS

The term cult is derived from a Latin root meaning “to break ground,” particularly in preparing (cultivating) a field for domesticated crops. The same root is seen in culture, in both a specialized scientific sense (a bacteria culture) and in a broader social sense (human culture). By extension, it was originally used in a religious sense, meaning behavior glorifying a deity or saint (the “cult” of Saint James). By the nineteenth century, the word came to be
used pejoratively about those who were excessively devoted to popular authors (the “cult” of Wordsworth), worshipping them as modern “saints.” Around 1900, this pejorative use influenced anthropologists to use cult to refer to ancient or allegedly primitive religious practices (as in “cult” objects or “cargo cults”).

The popularity of this negative sense makes the term difficult to define objectively, since a “cult” in an outsider’s eyes may well be a “new religion” to someone inside the group. Both the positive and negative uses of the term, however, agree that a cult is a small religious group that exists in tension with a predominant religion. In particular, such groups are highly cohesive in structure and are headed by a dominant leader who influences members’ behavior in dramatic ways. They pursue a transcendent goal, claiming that the truths they preserve will transform all of society, and encourage direct religious experience through participation in rituals intended to foster ecstatic or supernatural phenomena. Often (though not always) they are apocalyptic in nature, holding that contemporary society is hopelessly corrupt and will soon be destroyed or transformed through the direct intervention of supernatural forces.

Cult behavior in the ordinary sense needs to be differentiated from the popular image of dangerous cults, drawn from the most extreme cases. In the popular imagination, cult leaders prey on impressionable youth and use mind control, brainwashing, hypnosis, and physical and sexual abuse to entrap and hold them against their will. “Cult” activity, in the most sensationalized images, includes ritualized sex abuse, self-mutilation, and, in some unconfirmed accounts, animal and human blood sacrifice. Often the agenda of such groups is thought to be to overturn organized religion or to promote the political agenda of evil others. Contributing to such pejorative images is the faux-etymology of cult as derived from occult, although this term, originally meaning “hidden” or “concealed,” has a distinct history. Few of these claims have ever held up to skeptical inquiry; nevertheless, popular accounts frequently assume that sociopathic behavior is integral to these cults’ activities.

Most cults in the historical record have been short-lived, but some persist to become the nuclei of important religious movements. Cults in both senses have been commonplace in European history from ancient times. Mystery cults, common in the Greek and Roman world, clearly were seen as charismatic movements that presented challenges to mainstream religions. Such groups, particularly the Bacchanalia, were frequently accused of being cults in the negative, sociopathic sense. Similarly, the persecution of the early Christian church by Roman authorities was based on persistent rumors that it was a dangerous cult that abducted and cannibalized babies.

During medieval times, Christianity itself fostered the growth of locally based movements devoted to the veneration of a local saint. Many of these developed into cultlike groups, and, while most were limited to a town or region in their influence, some, like the followers of Saint Francis of Assisi (c. 1181–1226), became important institutions (the Franciscan monks) in their own right. In early modern times, a number of breakaway factions of Protestant Christianity similarly began as small, strongly differentiated cults, and then grew into persistent religious movements. Some of these groups, like the Amish and Mormons (Church of Latter-day Saints) developed into stable institutions.

Yet some cults did engage in violent and abusive acts, giving warrant to these fears. Two notorious examples were the People’s Temple, founded by James Warren Jones (1931–1978) in Indianapolis during the 1950s, and the Heaven’s Gate movement, begun by Marshall Herff Applewhite (1931–1997) in the Pacific Northwest during the 1970s. Both cults ended their existence in spectacular acts of group suicide, the first in 1978, the second in 1997. Both have been extensively studied, and while both groups came to the same tragic end, the factors leading up to their self-destruction varied considerably. Both can be seen as extreme examples of cult behavior caused by each group’s isolation from outside culture and the growing mental instability of their leaders.

Both cults drew much of their ideology from the doomsday worldview prevalent among charismatic groups, which have become an important factor in both Catholic and Protestant Christianity. This ideology emphasizes controlling one’s personal and social behavior strictly in preparation for an imminent, violent apocalyptic struggle against demonic forces. This mindset makes such groups potentially dangerous when contacted unwisely by outsiders. The notorious 1857 Mountain Meadows massacre, carried out in part by members of the early Mormon Church, and the bloody counterattacks taken by the Branch Davidian enclave (near Waco, Texas) against federal agents in 1993 illustrate two additional
cases in which embattled cults turned to violent acts against outsiders.

Such extreme cases should not, however, distract scholars from studying objectively the many cults that continue to arise within mainstream religions and as alternatives to them. However, many more such groups remain diffuse enough that their members’ involvement in these religious groups does not separate them from their everyday work and social worlds. Such cults have been and will continue to be positive factors in the development of new religions and the modification of mainstream sects in response to the cults’ challenge. In addition to cults composed of charismatic Christians, many more such groups have become devoted to reviving neo-pagan rituals and investigating paranormal phenomena such as UFOs. According to the 2001 American Religious Identification Survey, the numbers of self-proclaimed Wiccans increased nearly seventeen-fold from 8000 to 138,000 during the previous ten years, with an additional 200,000 now belonging to a “pagan” or “new age” (Kosmin and Mayer 2001). Such new movements continue to provide individuals with creative means for pursuing religious experience.

CULTURAL CAPITAL

The concept of “cultural capital” posits that the way of life of a community constitutes a dynamic structure, including a number of services, that enhances the livelihood of the people. It also forms the basis of power relations and class. The origins of the concept stem mainly from the work of the French sociologist Pierre Bourdieu (1930–2002), who argued that it represents one of the many forms of capital that people can draw on to enhance their lives. The other forms include social capital, human capital, durable fixed capital, ecological capital, and even bodily capital. The notion of cultural capital is part of the “multiple capital paradigm” (O’Hara 2001), and one must link various capitals to comprehend macro-sociological processes such as inequality, stratification, and conflict.

DIMENSIONS OF CULTURAL CAPITAL

There are three main types of cultural capital: cultural artifacts, institutions, and embodied capital. Cultural artifacts include reproductions of the cultural creations of society. These may be materials in museums, art galleries, and libraries; modes of dress; symbolic commodities; or modes of architecture. These artifacts can be seen as a form of embodied cultural labor, provided they truly form part of the historical or contemporaneous life process of the community. These artifacts may be critical in the study of previous cultures, particularly if there is little or no written record of cultural habits and practices. For contemporary market capitalist economies, artifacts sold for money provide a source of knowledge about the relationship between cultural and economic capitals.

Institutions provide insights into the way of life of the community. For instance, the institutions of nationalism provide insights into the way in which people bond together as a nation-state, while the institutions of education help comprehend the reproduction of knowledge and class in society. The family, as an institution, enables insights into critical forms of gender relations, kinship linkages, and networks of privilege and association. Market institutions, meanwhile, enable one to recognize how symbols, status, and financial advantage are interrelated and reproduced through historical time.

The third form of cultural capital, embodied capital, is a personal form of intergenerational transfer of networks and relations. Families, for instance, provide a series of lifestyle habits and relationships through networks, which become a sort of “advance” to the next generation of children. There is a tendency for these family linkages to shape people’s behavior and values from generation to generation. This relates to practices such as manners, connections, qualifications and habits of life and livelihood.
Such linkages are critical to the generation of class differences between people.

AGENCY AND STRUCTURE

Bourdieu's analysis of cultural capital has been quite successful in linking agency and structure in the determination of class, habit, and space. Class relationships are reproduced in a subtle manner through association, upbringing, emotional ties, education, and access to material resources. Individuals are as important as institutions in the generation of privilege and power.

Individuals and structures are linked through cultural capital, as shown in Figure 1. Individuals and structures interact through time in the determination of socioeconomic processes. Individuals have certain preferences, resources, sentiments, and personalities that impact on their quality of life and contribution to society. Structures—in the form of families, classes, gender, ethnicity, institutions, networks, and the gene pool—also impact on individuals. Agency and structure are linked through cultural capital, particularly through the activation of habits in particular cultural spaces.

Bourdieu’s notion of “habitus” refers to the acquired habits of dress, manners, modes of perception, ways of speaking, personal hygiene, and other traits of everyday life. Many of these habits have commonalities among certain groups, classes, and nations, and they help to bind people together in networks and institutions.

The notion of “cultural space” or “field” is also important here, for people’s everyday behavior is acted out in various relatively autonomous arenas. There are a multiplicity of such spaces, which are interrelated yet become activated through their own logic of operation and motion (see Emirbayer et al. 2005). These include the fields of legal space, economic space, social space, bureaucratic space, familial space, and so on. These can be delimited further—social space, for example, includes further microcosms of fashion, media, literature, art, and academia. The habits of individuals acted out in various cultural spaces demonstrate how people interact as social individuals, thus linking agency and structure.

Evidence shows that, in many contemporary societies, there are distinct differences in the way parents bring up their children, inculcating them with certain habits in familial space. Middle-class parents tend to inculcate a degree of debate and exploration in their children. They also tend to stimulate fairly wide social networks and nurture a degree of independence of thought. Working-class parents, on the other hand, tend to be more specific in their directions and discussions; have stronger family, rather than social, networks; and have children who are more dependent upon them emotionally and physically (see Egerton 1997). These variable forms of cultural capital are critical to the reproduction of privilege, advantage, and power.

POWER, CULTURE, AND POLICY

Cultural capital also illuminates the role of power in society. Power is not simply a product of economic and political relationships. It also emanates more broadly from cultural associations. Power resides in the ability of people to form and maintain dynamic social networks, with reciprocity and friendships being an important part of the process. Power is enhanced by cultural capital through the building and maintaining of relationships and habits of advantage. These advantages take many forms, including material and monetary wealth, political influence, friendships and relationships, health, and safety within the society.

Those individuals and groups seeking power and authority thus either need to be ideally suited (or adapted to) the dominant modes of interplay of habitus and space, or they must try and condition people’s habitus through these cultural spaces. They can try and change the very rules through which people act out their social life, but it must be done subtly and with a thorough knowledge of the cultural way of life of the community. Similarly, policymakers must put their measures into practice within the framework of this nexus of individual-social habits and cultural space. Social capital is important in the provision of trust and sociality required to divert resources and assets in the prescribed direction.

Cultural capital is thus part of the multiple capital paradigm, which by linking agency and structure interprets relations of class, power, ethnicity, and social position. Some questions remain in areas such as class, gender, and ethnicity, with a need for more complexity and historical specificity, and for more empirical and theoretical development. Overall, though, cultural capital is a powerful mode of interpretation of structures of diversity, cooperation, and power in the contemporary world.
**Cultural Group Selection**

The concept of group selection is controversial in both the natural and social sciences. In contrast to the standard social science assumption of methodological individualism and the biological assumption of the gene as the relevant unit of selection, group selection posits that distinct evolutionary and selection pressures may operate at the level of the group rather than the individual level. As a result, group selection argues that it may be possible for social rules and biological traits to evolve and persist that cause individuals to act *altruistically*, that is, in ways that are good for others or the group as a whole, but detrimental to particular individuals within the group. In group selection models, the relevant level of selection for some questions is thus at the level of the group (family, firm, cultural group, nation) rather than among the constituent individuals that compose those groups.

The concept of group selection gained some intellectual currency in the 1960s and its leading modern advocate in the social sciences was F. A. Hayek. These early naïve group selection models were swept aside by the rise of “selfish gene” theory as the dominant paradigm in evolutionary biology. Selfish gene theory argues that altruism is not an evolutionary stable strategy as an *a priori* matter because selfish individuals will have the incentive and opportunity to free ride by accepting the benefits of others’ altruism without bearing the costs. Those with selfish genes will prey on the altruists in the population, thereby rendering the altruistic tendencies unfit for survival and replication. Critics of cultural group selection have similarly argued that those models are similarly suspect because cultural rules and practices are similarly subject to erosion by free riding by selfish individuals who comparatively benefit from refusing to abide by socially beneficial rules (such as prohibitions on fraud or theft) followed by others. Both critiques thus conclude that group selection models lack appropriate microfoundations that ground group level selection in the incentives and interest of the individuals that compose the group and thus should be selected against in the population.

Subsequent analysis, however, has concluded that the plausibility of group selection models is an empirical question, not a priori question. Group selection rests on a tension between two competing forces that push in opposite directions—intragroup selection, that is, competition among different individuals within a given group, versus intergroup selection, or competition between different groups. Intragroup selection promotes individual selfishness and free riding in seeking to appropriate a disproportionate share of the social surplus. Intergroup selection, by contrast, promotes altruism within a given group because it benefits the group as a whole in competition with other groups (and thereby indirectly benefits each member of the group), even though altruistic individuals contribute more to the group than they personally receive in exchange.

In reconciling these competing pressures, the plausibility of a group selection model thus rests on three basic operative conditions. First, the genetic trait or cultural rule must promise sufficient benefits to the group that the members of the group will benefit from adopting it when compared with groups that do not adopt the rule or prac-

tice, that is, a social surplus is generated. These rules may be invented consciously or may simply arise by accident.

Second, there must be some mechanism for between-group competition to occur, that is, for groups with superior traits or practices to displace others. This competition and displacement may occur through warfare and conquest by the more successful group, migration from the less-successful group to the more successful, or imitation of the more successful by the less successful.

Third, the group must be able to restrain free riders that will dissipate the social surplus generated by the beneficial trait or rule. It is not necessary to completely eradicate free riding (which will be virtually impossible given the individual incentives to free ride), but simply to reduce it to the point where the overall benefits to the group are sufficiently large such that the benefits of retaining the trait or practice are large enough to offset the costs imposed by free riders. Social norms against antisocial behavior, legal and political institutions such as police forces that prevent theft, and constitutional institutions that encourage positive-sum wealth creation activities rather than zero-sum redistributive activities (or negative-sum rent-seeking activities), can all be viewed as mechanisms to limit the ability of free riders to dissipate the social surplus.

CULTURAL LANDSCAPE

Landscape is a word introduced into the English language during the late sixteenth century as a technical term used by painters. The word derived from the Dutch landschap and was known in English for some time as landskip. This painterly source of the landscape notion is significant. Landscape was recognized as such because it reminded the viewer of a painted landscape—a piece of inland scenery (Thomas 1984, p. 265; Groth and Wilson 2003, pp. 2–3). Landscape became a prominent, if contested, concept in mid-twentieth-century geography through the work of Carl Sauer (1889–1975)(see Livingstone 1992). His ideas about landscape were influenced by the debates between the German geographer Friedrich Ratzel (1844–1904) and the French sociologist Émile Durkheim (1858–1917), debates that focused on the society-milieu relationship (Buttimer 1971). Sauer argued that culture shaped the natural landscape to produce a “cultural landscape” (Sauer 1963, p. 343). He sought to avoid the environmental determinism of Ratzel, but acknowledged that it was not possible to devise an objective procedure for the study and comparison of landscape: a subjective, aesthetic, or meaningful element always remained (see Cosgrove 1984; Cosgrove and Daniels 1988).

Independent of this tradition of thought, the cultural and literary critic Raymond Williams (1921–1988) argued in The Country and the City (1973) that it is “outsiders”—estate owners, improvers, industrialists, artists—who have recourse to the notion of landscape, not those who live and work “in” the landscape. His influential work introduced the key element of politics and power to the way landscapes—cultural landscapes—are understood (see Bender 1993). Williams’s sharp distinction between “insider” and “outsider,” though, is difficult to sustain in any particular context and suggests that only some people make use of this concept.

Recent research and writing in anthropology, history, and related disciplines argue that peoples around the world shape and view their surroundings in ways not dissimilar to that captured by the Western concept of landscape and that the distinction between a “natural” and
“cultural” landscape is fraught with problems (see Ingold 2000). Consider the case of the Amazonian rainforest. It is often viewed as a pristine “natural” environment in which separate “cultures” live and draw upon its resources. However, historical ecology has shown that the current form of this environment is the outcome of extensive human manipulation over substantial time periods—creating grasslands, forests, and savannas (see Balée 1998). In a comparable manner the forest-savanna transition zone of Guinea in West Africa has been viewed by environmental policymakers for many decades as a relic of a once-extensive natural forest now destroyed by local farming and fire-setting. By contrast, anthropological research demonstrates that the landscape had been “misread”: local peoples explicitly create “forest islands” in which to live, and these are viewed as an index of prosperity and are aesthetically valued (Fairhead and Leach 1996). The historian William Cronon (1983, 1991) has documented analogous transformations in colonial New England and with respect to the rise of Chicago and the West: landscapes—whether prairie or forest—were reformed to enable the production and expansion of property ownership and commodity capitalism. In short, all landscapes are inherently “natural” and “cultural” (see Schama 1995). Landscapes are thus a process where people seek to realize, in diverse ways, the possibilities of their culture by simultaneously creating themselves and their environments or natures (see Hirsch 1995, 2004).

CULTURAL RELATIVISM

More than a century of ethnographic research profoundly supports the theory of cultural relativity, the theory that culture shapes beliefs, provides concepts, organizes value systems, and informs and orients human behavior. Anthropologists find it obvious that human behavior is culturally informed and culturally specific, and best approached as a series of “practices” with specific cultural orientations and entailments. Anthropologists are comfortable with cultural relativity as a matter of fact. While other disciplines have struggled to accommodate the realities of cultural relativity, in recent decades anthropologists have debated the social organization of cultural differences in complex societies under modern conditions. Cultural relativism, the paradoxical extension of the facts of cultural difference into an epistemology and moral philosophy doubtful of all absolutes, troubles other kinds of social scientists far more than it does anthropologists, who are, by and large, still confident of their capacity to critically understand matters of fact and questions of value under conditions of cultural variety and complexity. While other disciplines debate the perils of relativism, anthropologists debate the fate of cultural differences in a globalizing world.
Anthropologists are comfortable with facts of cultural difference because such differences are the very stuff of their research. Ongoing successes in the description and analysis of cultural differences are degrees of proof, after all, against strong forms of cultural relativism. Insofar as ethnographers—researchers into particular cultures—can successfully understand and explain unanticipated cultural differences, then regardless of the extremity of differences, cultures are not truly incommunicably and ungraspsably variant. To this degree they are not “incommensurable,” to use a term from Romanticist philology made popular (by Thomas Kuhn) in twentieth century philosophy of science. However, in other social science disciplines, facts of cultural difference have often seemed to threaten the quality of data rather than integrating it. In some disciplines, acknowledging fundamental cultural differences has seemed tantamount to succumbing to a knowledge-defeating relativism. In psychology and in linguistics, cultural relativism is rendered into an extreme, fascinating, but partly dubious theory of perception; for economics, political science, and sociology it is a challenge to the generalizability of research findings; for philosophy it is a contemptible threat to the certainty and even adequacy of any and all concepts and conclusions. Ironically, thus, cultural relativism means different things in different contexts. What it means and the depth of its threat to knowledge varies significantly according to the premises, needs, and purposes of the various disciplines. The public, like academic disciplines, can also take different stances toward different cultural relativisms; the same person can be a fascinated cosmopolitan when trying new clothing or food, an appalled observer watching a news broadcast, an angry voter, and a generous neighbor. Cultural relativities and cultural relativism can be unevenly acknowledged within a single discipline or person.

Debates about cultural relativism and cultural relativity predate the beginnings of the modern social sciences, and play an important role in their foundation. At one key juncture in the history of ideas, the philosopher Immanuel Kant was challenged by his one-time student, Johannes Gottfried Herder, over the origin and nature of concepts. Herder inspired research in the disciplines of geography, ethnology, and above all philology—the study of the history of words—when he doubted his teacher’s theory of pure reason. In a dispute that was simultaneously theological, political, and scientific, Herder argued that human beings observably relied upon signs to gain their concepts, and that their ideas neither came from nor moved toward any ethereal realm but began with words handed down within human communities. Human communities each thereby had their own kinds of knowledge, understanding, and meaning, not passively imbibed but actively fashioned and changed, with each person and each society its own blooming, self-fashioned work of art. Kant’s vision was of humanity gaining enlightenment slowly, reaching closer to a single, ultimate, God-given potential, and progressing most when political control was wisest and most absolute. In Herder’s view, humans had to rely on signs that were “arbitrary,” and highly variant from place to place and time to time, as part of God’s divine plan: The unending need to critically assess and change their signs and concepts gave humanity creativity and free will.

As philological research led to nineteenth-century efforts to found a science of language in general, one of the pioneers of this transition, F. Max Müller, coined one of the most extreme expressions of a language-sign-based cultural relativity: “No reason without thought; no thought without language.” By this formulation, reason and truth would be entirely dependent on language. Müller debated with Charles Darwin over the origins of language and thought; Müller thought he had found a perfect synthesis of Kant, Herder, and all religion in a theory that posited humanity’s active corruption of originally perfect God-given signs and symbols. Darwin argued for a material origin in natural history for thoughts, concepts, and language, and was joined by William Dwight Whitney, another of the founders of linguistics, who reconfigured Herder’s conception of the arbitrary nature of signs into a theory of the material, natural origins of words and concepts. Whitney led linguistics to seek an evolutionary theory of language without recourse to divine reason or invention.

By the twentieth century, especially in U.S. anthropology under the leadership of Franz Boas and his students, the debates moved from language to culture, and scholars resorted to theological arguments much more rarely. Perhaps the most famous explorer of linguistic relativity and its significance was anthropological linguist Benjamin Lee Whorf. Whorf proposed that Hopi habitual thought and behavior was organized by ontological premises also present in Hopi language grammar; he claimed especially that the Hopi thought about time differently than Europeans, and organized their way of life, including ritual, politics, and economics, around premises about repetition and duration that were readily understandable from study of their language grammar.

Whorf’s arguments have been misunderstood, largely because psychologists had great need for a different argument, suitable for laboratory testing. What became known in psychology as the Whorf hypothesis or the Sapir–Whorf hypothesis (Edward Sapir being another leading Boasian linguist) was the idea that language shaped human perception of things. This argument could have and probably should have been attributed to Müller, who made it, rather than to Whorf, who did not. (Whorf argued that Hopi perceived space the same way Europeans did, the focusing system of their eyes generating the same
Psychologists have been most interested, for obvious reasons, in the significance of variations in language and culture for apparatuses of cognitive function, and in particular the relations of systems of perception and cognition. They find increasingly precise and complex means to identify what is variant and invariant in the structure and organization of human perception and cognition. The situation is different for other social sciences (and for some branches of psychology as well, including social psychology and abnormal psychology, and the emerging field of biosociality). When research focuses not on processes happening within mind and body, but rather on larger social fields of interaction between people, then the issues connected to cultural relativity challenge scholarship differently.

The Boasians also opened up the questions in this area. Ruth Benedict, a student of Franz Boas, wrote extensively in the 1930s and 1940s about social and political implications of cultural relativity. Some credit her with coining the concept. In Patterns of Culture (1934) and The Chrysanthemum and the Sword (1946) she wrote directly to the U.S. reading public, on a mission to demonstrate the reality and significance of cultural differences. On a “shrinking planet,” she argued, with societies increasingly interconnected and interdependent, the hard work of mutual understanding was increasingly vital to achieving peace, health, and prosperity. Americans still strongly tended to imagine that their most cherished values came straight from God, and while few social scientists took that route many still hoped to directly observe behaviors generated by an unmediated human nature, and were disappointed to discover that culture mediated even passions and pleasures, and expectations of risk and reward. At the end of World War II, Benedict was greatly concerned about an American society that mistook for human nature the fundamental tenets of its own political culture, such as the individual’s right to the pursuit of happiness, which Americans gave a near sacred status. Benedict argued for culture-consciousness in mature political debate. She exemplified the fact that consciousness of cultural relativity need not lead to relativism in morality and politics. She allied herself with skepticism, not relativism, in philosophy, and had no trouble aligning her science with specific politics, as in her anti-Nazi, pro–civil rights treatise against prejudice in the assessment of race differences. Race: Science, and Politics (1940), which disputed allegations of difference in racial capacities, and traced the connection of such allegations to other forms of prejudice.

In the division of labor in the social sciences, anthropologists continue as students of cultural difference and skeptics of claims about human universals, while other disciplines accommodate facts of cultural difference while pursuing more general truths. The tensions here are productive. Anthropologists have also, for decades now, studied the creative conflicts that result when people, societies, and cultures productively and destructively interact. While some political commentators at the end of the twentieth century were convinced that globalization and democratization had brought on “the end of history,” few anthropologists agreed. Reflections on the extremities of twentieth-century political violence make moral relativism unsustainable—not only for what it would allow, but also for what it would license us to forget or ignore. But in between moral relativism and universalistic insistence on one best final outcome for all political, social, and cultural questions there are, still, the positions pioneered by the Boasians—scientific skepticism with recognition of cultural relativity, and perhaps room even for a version of the philosophical plenitism pioneered by Herder. If scientists are, by method, skeptical of final claims, it does not make them relativist. The science of culture, even in the most cosmopolitan zones and most self-conscious reflections on selves and others, still produces a plenitude of evaluations—the point is not that “anything goes,” but that many things continue and new things come along, and that all things might be improvable with reflective recognition of cultural specificities and differences.

Culture is the condition of possibility of meaning, and in both small scale and large, it thrives and grows with human success in making the world meaningful. It is an irreducible part of the environment, a built environment, an environment that makes human intelligence useable and increasingly useful. Some seek to move beyond cultural relativity, and try to think beyond culture, and seek truths independent of culture or constant across all cultures. Ironically, recurrent and persistent renewal of this quest is a hallmark of the culture of the European enlightenment, especially in the dreams of freedom and independence that it shares with its own countercurrent,
Cultural Resource Management

Romanticism. Neither this Enlightenment tradition, nor many other value systems, are likely to submerge easily into a homogenous and unitary global culture, no matter how much our global civil society intertwines.

CULTURAL RESOURCE MANAGEMENT
Mostly used in North America, the term cultural resources refers to important sites, objects, and places that have some form of legal protection. The term has its origins in the late 1960s as part of an effort to gain the same level of legal protection for places of cultural and historic importance as had been achieved by endangered natural resources. The term cultural resource management (CRM) can be defined as the practice of managing cultural resources in response to some legal or policy mandate. The terms heritage resources and heritage management are common synonyms for cultural resources and CRM, respectively.

Cultural resources include a vast range of properties whose importance derives from their aesthetic, historic, religious, or scientific value. A cultural resource may be a traditional plant-gathering area or an example of high Victorian architecture. The term covers places and objects both glorious and modest: archaeological sites from the most ancient of prehistoric sites of all eras to the remains of 1930s labor camps; buildings ranging from St. Paul’s Cathedral in London to a vernacular cabin; structures, including canals and bridges; and places that are important to living cultures, from historic battlefields to sites of religious or traditional significance to indigenous groups.

Despite their diversity of forms, all cultural resources have two characteristics in common: they are regarded as important by a segment of contemporary society (be it a group of neighbors, an Aboriginal clan, or professional archaeologists); and they are considered worthy of some form of protection because of this value.

The goal of CRM is to manage important cultural properties for the public benefit. This is achieved by the application of law and public policy. Since every nation has its own unique and important history and cultures, most have developed their own statutes on national, regional, and even local levels that govern how cultural resources should be treated. In the United States, for example, the National Environmental Policy Act (NEPA), the National Historic Preservation Act, and dozens of state laws, such as the California Environmental Quality Act, require analysis of potential impacts on cultural resources. This process has a general counterpart in the United Kingdom in the requirements of “Planning Policy Guidance 16,” in New Zealand in the Historic Places Act (1993), and in Australia in the Environmental Protection and Biodiversity Conservation Act (1999). Like nonfederal governments worldwide, the Australian state of Victoria has enacted its own law—the Heritage Act (1995). This statute offers more protection than is provided by federal legislation, which is principally concerned with nationally significant resources.

The looting of historic shipwrecks located in international waters is a matter of continuing discussion between...
nations and the International Congress on Monuments and Sites (ICOMOS), an influential nongovernmental organization. While many national governments have taken measures to protect wrecks from looting within their own waters—such as the United Kingdom's National Heritage Act (2002)—few restrictions apply to the open seas. ICOMOS's Charter on the Protection and Management of Underwater Cultural Heritage (1996) is an attempt to fill this gap; it is, however, still to be ratified by many nations.

As a practical matter, the CRM process is usually set in motion when an activity is proposed and the potential impacts are reviewed by a public agency to comply with an environmental protection law. Building a dam and reservoir, for example, may lead to the inundation of an indigenous group's traditional plant gathering site—a type of cultural resource. Construction projects often involve three phases of CRM: identifying resources by means of an on-the-ground inventory, evaluating their importance, and deciding how impacts to significant examples should be managed.

CRM is not synonymous with preservation. Since it assures a process, not a result, the only guaranteed outcome of CRM is that the values contained in cultural resources are weighed in relation to other social benefits. Thus, a government agency might allow the destruction of an important archaeological site in the interest of improving a dangerous road. In this case, the project proponent may be required to scientifically excavate the site to retrieve important information it contains before the data are destroyed by construction. This commonly imposed mitigation measure is termed preservation by record or data recovery in the United Kingdom and United States, respectively.

As a profession, CRM is practiced by anthropologists, architectural historians, geographers, environmental planners, historians, and archaeologists, among others. It has been estimated that CRM accounts for over 90 percent of archaeological projects carried out in the United States.

CULTURAL RIGHTS

The term cultural rights refers to a claimed entitlement on the part of identity groups—typically based on religion, ethnicity, language, or nationality—to be able to express and maintain their traditions or practices. Such an entitlement usually implies some form of political or legal recognition. Cultural rights have developed as a distinct set of rights claims particularly since the 1960s, and then largely in light of the experience of cultural minorities—such as indigenous peoples, substate nationalities, and immigrant groups—living in a state or society that is characterized by a dominant culture. “Cultural rights” thus figure prominently in discussions of national minority rights and multiculturalism. Nevertheless, cultural rights are commonly understood as a universal human right, one that recognizes the fundamental importance of a sense of cultural identity, membership, and shared values to human well-being and flourishing.

The political and legal recognition associated with cultural rights may take various forms. Such recognition may be symbolic, as when a state includes the symbols of one or more of its minorities in the national flag or observes a minority holiday as a public holiday. It may involve accommodation of specific minority cultural practices, such as granting exemptions from generally applicable dress codes to members of religious minorities who wish to wear their special clothing. It may concern the public subsidization of cultural groups—through direct grants or tax relief—so that they might better preserve their cultural heritage and community life. It may encompass intellectual-cum-cultural property rights that compensate groups for the use of their artifacts, land, or participation. Recognition may also include allowing citizens to hold dual or multiple citizenships, admitting cultural defense in criminal proceedings, or granting cultural or linguistic autonomy to particular groups to run their own educational and cultural institutions in their own languages. Finally, cultural recognition may be overtly political in the sense of granting special political representation or even political autonomy or self-government to particular cultural groups.

As these examples suggest, cultural rights should be distinguished from rights to nondiscrimination and affirmative action policies, which also relate to group membership. Where antidiscrimination legislation seeks to preclude, and affirmative action seeks to redress, the prejudicial denial of offices and opportunities to individuals on the basis of their background group characteristics, cultural rights are concerned with enabling cultural groups or their members to express and maintain their cultural attachments. Nevertheless, an important historical and conceptual connection between antidiscrimination legislation and cultural rights has been the growing
Cultural Studies

Cultural rights have been recognized in various international protocols and legal instruments. The 1948 Universal Declaration of Human Rights states that “everyone, as a member of society,” is entitled to “cultural rights indispensable for his dignity and the free development of his personality” (Article 22). Article 15 of the International Covenant on Economic, Social, and Cultural Rights (1966) recognizes the right to “take part in cultural life,” and Article 27 of the International Covenant on Civil and Political Rights (1966) asserts the right of “persons belonging” to “ethnical, religious, or linguistic minorities” to “enjoy their own culture, to profess and practice their own religion, or to use their own language.” The Declaration on the Rights of Persons Belonging to National or Ethnic, Religious, and Linguistic Minorities (1992) stipulates further that such persons have the right to enjoy their own culture “in private and in public,” and that states “shall take measures to create favourable conditions to enable” individuals to exercise their cultural rights (Articles 2 and 4). Although not binding, a major United Nations research report, The Human Development Report 2004: Cultural Liberty in Today’s Diverse World, helpfully addresses the major issues and concerns surrounding cultural rights by incorporating them into a broader human development framework.

CULTURAL STUDIES

Anyone attempting a definition of cultural studies is confronted at the outset by a paradox. On the one hand, the emergence of cultural studies as a recognized discipline or field of study, particularly from the 1970s onward, can be clearly seen in the proliferation of academic departments, degree programs, academic journals, and scholars who proclaim themselves to be producing work in “cultural studies.” On the other hand, what precisely “cultural studies” takes as its object or area of study, its definitive theoretical, epistemological, or methodological approach, is less clearly identifiable—indeed, some scholars have claimed it is this very breadth and eclecticism that is the definition of cultural studies (Barker 2003; During 1999, 2005). Colin Sparks has thus described cultural studies as “a veritable rag-bag of ideas, methods, and concerns” (1996, p. 14).

At a basic level, cultural studies is, as the term suggests, the study of “culture.” It takes as its focus the ways in which people live, think, and express themselves in everyday practices and contexts. Raymond Williams (1921–1988), one of the founding figures of cultural studies, famously described culture as “a particular way of life, whether of a people, a period, or a group” (1976, p.
90)—a definition that has close links to the anthropological idea of culture. However, the focus for cultural studies has been primarily on Western, modern, and contemporary cultures, on understanding the seemingly ordinary practices, objects, and images that surround us and that make up our sense of who we are—from music and media to education, inner-city subcultures, pubs, and shopping malls. Its focus stretches from the microstudy of local identities, such as gangs, to the global movement of cultural commodities, such as hip-hop or Bollywood films. To this end, cultural studies has been resolutely inter-, multi-, or even transdisciplinary in its approach, drawing from disciplines such as sociology, anthropology, history, and English literature. Similarly, cultural studies utilizes a range of research methods, from in-depth ethnographic fieldwork to textual and visual analysis.

STARTING POINTS: THE BRITISH CONTEXT AND THE CCCS
Cultural studies is now a global phenomenon, but it is generally agreed that the discipline began locally, at the Centre for Contemporary Cultural Studies (CCCS) in Birmingham, England, in the 1960s. Most scholars trace the emergence of cultural studies to the interventions of three men and three seminal texts: Richard Hoggart’s *The Uses of Literacy* (1957), Raymond Williams’s *Culture and Society* (1958), and E. P. Thompson’s *The Making of the English Working Class* (1963). Hoggart, indeed, was the founder and first director of the CCCS, which was established as a postgraduate research center attached to the University of Birmingham in 1964.

What these three texts shared, albeit in very different ways, was a concern with “popular culture” that sought to challenge traditional elitist notions of culture as art and aesthetics—what Matthew Arnold (1822–1888) referred to as “the best that has been thought and said in the world” ([1869] 1960, p. 6)—or as “civilization” (Jenks 2004). In its place, they celebrated culture as ubiquitous, as everyday, and as made by ordinary people—“the study of relationships between elements in a whole way of life” (Williams [1961] 1965, p. 63). There are two key arguments that characterize these texts: firstly, that culture expresses meanings (i.e., it reflects our understanding of the world around us); and secondly, that culture flows from the experiences of ordinary people (hence, Williams’s assertion that “culture is ordinary”) (Procter 2004). Furthermore, this experience comes out of the historical and social location of individuals and groups—specifically, their class location. In particular, the authors claimed a sense of legitimacy and agency for working-class and popular cultures as valid and valuable sources of cultural expression and meaning making (Hall 1996).

THE STRUGGLE FOR CULTURE
Stuart Hall took over the directorship of the CCCS in 1968, marking a change in the way cultural studies was both thought and done. In particular, Hall brought the center’s engagement with Marxism into creative tension with structuralist theory, as exemplified in the works of French theorists Claude Lévi-Strauss, Roland Barthes (1915–1980), and Louis Althusser (1918–1990) (Hall 1992a, 1996; Procter 2004). Put simply, structuralism contests the assumed connection between culture and meaning. Rather than seeing culture as simply reflecting meaning (as Williams had done), structuralism sees this relationship as constructed and arbitrary (Hall 1997). This means that culture is not simply an embodiment of a real experience, but creates that experience and shapes its meaning for us.

Hall sought to bring these two paradigms—culturalist and structuralist—together through the work of Italian Marxist Antonio Gramsci (1891–1937) and his theory of hegemony. This refers to the ways in which a dominant group maintains its control over other groups not through coercion, but through winning and shaping assent “so that its ascendancy commands widespread consent and appears natural and inevitable” (Hall 1997b, p. 259). This is achieved in the realm of “culture”—through shaping how people think of and experience their world. However, because our societies are marked by forms of social division and inequality, subordinate groups enter into conflict with the dominant group to contest these meanings. Culture thus becomes the site where social divisions (class, gender, race and ethnicity, sexuality, disability, etc.) are both established and resisted.

Culture, in the traditional cultural studies paradigm, is thus highly contested and politicized. Firstly, it rejects the distinction of high and low culture, and celebrates popular and mass cultures as legitimate forms of expression. Secondly, it sees culture as always changing and dynamic—as a process rather than a possession. Thirdly, it sees cultures as challenging and transforming meanings, images, and understandings (Hall 1997a; Jenks 2004). Fourthly, it has taken as its primary focus of study subordinated and marginalized cultural forms and expressions—particularly around working-class and youth (sub)cultures.

This classic cultural studies approach was challenged in the 1980s and 1990s through the emergence of postmodern and post-structural theories. Although part of a much broader intellectual movement, postmodernism rejects the idea of coherent or stable cultural identities and meanings, and insists instead on the fragmentary and transitory nature of culture. Stuart Hall thus writes of “the breakdown of all strong cultural identities . . . producing that fragmentation of cultural codes, that multiplicity of
styles, emphasis on the ephemeral, the fleeting, the impermanent, and on difference and cultural pluralism” (1992b, p. 302). This view of culture is linked closely to the increased globalization and commodification of culture. Individuals become bricoleurs, creating their own styles and inhabiting a multiplicity of identities, and opening up a range of cultural options, meanings, and political possibilities (Barker 2003; During 2005).

CULTURAL STUDIES GOES GLOBAL
Through the 1990s, cultural studies has grown both in terms of scope and of content, traversing disciplines and diversifying its subject matter and theoretical and methodological approaches. In particular, as researchers have engaged with the increasingly globalized nature of cultural forms and connections, cultural studies can also be said to have gone global—at once exploring the ways in which culture travels and how it is shaped within particular local or national contexts (During 2005).

“Cultural studies” as an academic discipline is now well established in the Anglophone world, particularly in Australia, Canada, and the United States, and is increasingly linked to the arts and media practitioners. Interest in the field is also growing in Asia, Africa, and Latin America, though in all these places it takes on different forms and emphases. In the United States, for example, where “cultural studies” as both a discipline and set of institutions has exploded, cultural studies traces its historical development from postwar American studies and from African American writers, scholars, and activists (During 2005) and is closely linked contemporarily with the study of minorities, postcoloniality, multiculturalism, and race. This is in sharp contrast to the United Kingdom (and Australia), which has traditionally marginalized issues of race and ethnicity—as well as gender—in cultural studies (Hall 1992a).

CULTURAL STUDIES IN CRISIS?
Cultural studies is not without its critics, both from outside and within the field. Indeed, as cultural studies has expanded and transformed, it has been argued that it has lost its original engagement with politics and power, with the lived experiences of “the everyday,” and has instead become overly fascinated with cultural commodification, consumption, and production. Focusing on music, film, literature, and the media, cultural studies has, it is argued, privileged texts and discourse over people, and cultural practices and pleasures over the structures of power and material contexts within which these practices and pleasures take shape (Hall 1992a; McRobbie 1992). Still others have argued that the neo-Marxist underpinnings of the cultural studies project have been thrown “into crisis” by its encounter with postmodernism and post-structuralism, which have fractured ideas of power and meaning, and the relationship between them, and have privileged an individualistic and overcelebratory version of cultural expression (Storey 1996; During 2005). The lack of engagement of some strands and traditions of cultural studies with race and gender has already been commented upon. The growth and institutionalization of cultural studies have led some to fear for a loss of focus—that cultural studies could mean anything—and others to fear for a regulation of its critical and political edge in favor of a marketable pedagogy (Hall 1992a).

Clearly, what cultural studies is, or may become, is open to debate, contestation, and transformation. However, as Hall has stated, the study of culture is “a deadly serious matter . . . a practice which always thinks about its intervention in a world in which it would make some difference” (1992a, p. 286).

CULTURAL TOURISM

Cultural tourism is a type of special interest tourism involving leisure travel for the purpose of viewing or experiencing the distinctive character of a place, its peoples, and its products or productions. A wide range of destinations and cultural activities fall under the umbrella heading of cultural tourism: visits to UNESCO World Heritage Sites (e.g., China’s Great Wall, Chichén-Itzá); tours of historic cities, architectural sites, cathedrals, and battlefields; excursions to museums; trips to sample typical regional foods; tours of ethnic neighborhoods; travel to local music festivals and cultural performances; visits to indigenous villages or distinctive cultural landscapes (e.g., observing farming practices in Asian rice fields). Although cultural tourists’ motives vary, some common themes include the desire to experience an “authentic” cultural landscape, interest in other cultures, and an interest in scenery that fosters an engagement with the past.

Since anthropologists and sociologists first turned their attention to tourism in the 1970s, there have been a variety of attempts to classify particular types of tourism. Some scholars, such as Valene Smith (1989), have proposed more refined subdivisions to the broader category of cultural tourism, including ethnic tourism (to see indigenous peoples), historical tourism (focused on the glories of the past, museums, monuments, and ruins), and, in a separate category, cultural tourism, which she defines as travels to see “vestiges of a vanishing lifestyle that lies within human memory” and involves “rustic inns, folklore performances, [and] costumed wine festivals” (Smith 1989, pp. 4–5). While some scholars embrace these taxonomic distinctions, others simply utilize the broader umbrella term cultural tourism. Recognizing that most tourists engage in a variety of activities on any given trip (ranging from sampling local delicacies to touring picturesque villages), more social scientific attention has been directed away from refining taxonomies and toward better understanding the sociocultural transformations that are part and parcel of cultural tourism.

A number of scholars have chronicled how the advent of tourism has transformed local peoples’ conceptions of their own identities and cultural products. Tourism literature tends to project fixed and alluring images of destinations, despite the fact that these destinations are undergoing transformations in tandem with the broader dynamics of globalization, including tourism development. In some locales, the promotion of cultural or ethnic tourism has prompted residents to become experts in marketing their own authenticity, playing the native and drawing on and manipulating the cultural symbols spotlighted in the tourist literature for economic gain or to enhance their cultural standing vis-à-vis other ethnic groups, as Timothy Oakes (1998) has illustrated in his analysis of ethnic villages in China. As Pierre van den Berghe (1994) and Nelson Graburn (1976) observe, the focus of ethnic tourists’ gazes are often Fourth World peoples, members of disempowered communities on the fringes of larger nations. For such peoples, while tourism can potentially bring new sources of revenue, it can also attract outside entrepreneurs who may substantially divert the flow of income.

Likewise, cultural tourism can fuel the commoditization of ethnic arts, dances, and rituals. Although commoditization does not necessarily bring loss of meaning, as Graburn notes, the significance may be transformed. For example, Michel Picard (1990) observes that tourism and tourist productions have become so intrinsic in Bali that they have contributed to shaping contemporary Balinese ethnic identity. Other scholars find that cultural tourism can be a factor in reconfiguring aspects of local gender relations. For instance, Elyane Zorn (2004) documents how the new tourist market for textiles woven by Taquilean women has enabled these Andean women to take on more visible roles in public life. Elsewhere, cultural tourism may contribute to the eroding of local rank hierarchies and to newfound ethnic self-consciousness and cultural pride, as Kathleen Adams (2006) has chronicled among the Sádan Toraja of Indonesia.

Cultural tourism can be highly political. As Michel Picard and Robert Wood illustrate, states are deeply involved in structuring cultural tourism and in “shaping the visible contours of ethnicity” (1997, p. 5). In some cases, such as the Mexican government’s promotion of Aztec pyramids as national symbols, tourist sites associ-
ated with the heritage of indigenous minorities are used to legitimate the nation. In other cases, such as the bombing of Egyptian pyramids by militant Muslims, cultural tourism is so enmeshed with international politics that destinations frequented by tourists from Western nations become targets.

In some places cultural tourism has led to the transformation of physical settings, environmental degradation, soaring land prices, and reduced access to the land for indigenous peoples. Cultural tourism can also create conflict between tourists, tourism promoters, and locals over the meaning and use of sites. Australia’s Ayers Rock is one such setting, where tourists scaling the peak violate indigenous views of it as a sacred site. In some settings, locals have developed strategies to reduce the intrusive aspects of tourism, formally or informally delineating front-stage areas for tourists and back stage areas for local life beyond the tourist gaze (MacCannell 1989).

CULTURE

Culture is notoriously one of the most difficult terms to define. The cultural historian Raymond Williams (1921–1988) notes that the difficulty in defining the word is located on its “intricate historical development” in European languages and on the fact that despite its long history the term is relatively new in the English language (Williams 1983, p. 87). The word derives from the Latin cultura, which in turn comes from the Latin verb colere, which had a wide range of meanings that corresponded to different domains in life: agricultural (to cultivate), domestic (to inhabit), religious (to honor a deity through worship), social (to protect). Williams pointed to the eventual divergences of these original meanings, such as the derivation of the term colony, from the meaning of cultura “to inhabit,” or cult, from the meaning “to honor through worship.” The primary meaning of cultivation, in cultura, has nevertheless been retained within the integrity of the word. Hence culture and cultura still echo the original main meaning of cultivation. The poet and critic T. S. Eliot (1885–1965), in his 1949 book Notes Towards the Definition of Culture, observed that the term “cultivation” applies as much to “the work of the bacteriologist or the agricultralist” as “to the improvement of the human mind and spirit,” (p. 19) although he concludes that the primary location of culture is religion.

By the mid-eighteenth century the term appears in both French and English in its proto-modern form, and in German it appears as a borrowing from the French first as Cultur (in the eighteenth century) and then as Kultur (in the nineteenth century) as almost synonymous with “civilization.” The German philosopher Johann Gottfried von Herder (1744–1803) observed that the slippery nature of the two terms denoted the slippery understanding of “culture” and “civilization” and the frequent conflation of the two. Herder separated the notion of “civilization” from the notion of “culture” and developed the theory of “cultures” in the plural, refuting the universalist theories of a unified development of humanity. The anthropological development of the theory of culture rests precisely on this notion of “culture-in-the-plural,” the acknowledgment that specific cultures existed in different times and places,
and that even within specific nations there existed a number of different cultures (Herder [1784] 1968).

The English anthropologist Edward Tylor (1832–1917) in 1871 proposed a definition of culture that conflated "culture" with "civilization" and informed early anthropological definitions of the term: "Culture, or civilization ... is that complex whole which includes knowledge, belief, art, law, morals, custom, and any other capabilities and habits acquired by man as a member of society" (Tylor 1871, p. 1). Franz Boas (1858–1942), one of the key figures in modern anthropology, especially in the history of U.S. anthropology, comes from the intellectual tradition begun by Herder and furthered by Tylor; Boas developed a theory of culture from which he derived a theory of racism. He noted that cultures cannot be judged according to an a priori value system. Rather, each culture has its own integrity, and all cultures are equal to each other and ought to be gauged according to their own system of values. This relativist approach to culture underlined Herder's original idea that one ought not be thinking about a culture to which all the rest would be held accountable but about cultures as they appear in different formulations and places over time. Boas wrote: "Culture may be defined as the totality of mental and physical reactions and activities that characterize the behavior of the individuals composing a social group" (Boas 1938, p. 159)—a definition strangely constricted from the one he had produced only eight years earlier: "[C]ulture embraces all the manifestations of social habits of a community, the reactions of the individual as affected by the habits of the group in which he lives, and the products of human activities as determined by these habits" (Boas 1930, p. 79). Leslie White expanded the definition of culture provided by Boas by including in its definition not only the traits that characterize it but also "the traits that do not characterize it" including, thus, within the definition of culture as comprising the characteristic traits of a group those traits which could be considered as marginal, resistant, or, even, abjected (White and Dillingham 1973, p. 32).

The anthropological definitions of culture were in part a reaction to the exclusionary definitions put forth in 1869, two years before Tylor's, by the British poet and critic Matthew Arnold (1822–1888). Against the Herderian opening of culture and civilization to all human societies, Arnold erected the discourse of a priori perfection: "I have been trying to show that Culture is, ought to be, the study and pursuit of perfection," Arnold wrote, "and that of perfection as pursued by culture, beauty and intelligence, or, in other words, sweetness and light, are the main characters" (Arnold 1869, p. 11). Arnold thus articulated the difference between what is called "high" culture (sublime, light, sweet, beautiful) and "low" culture (what later came to be called popular culture).

In a critique of this sublimity of culture as presented by Arnold, the literary theorist Edward Said (1935–2003) argued that high culture was complicit with the project of imperialism. In his 1979 book Orientalism, Said showed the ways in which the constructed distinctions made between the Orient and Occident as fabricated geographical ideas were mainly located in the internalization of the idea of high culture as intrinsic to Europe set against "cultures" that needed to be translated into the European intellectual idiom.

The Frankfurt School philosophers Max Horkheimer (1875–1973) and Theodor Adorno (1903–1969), in their Dialectic of Enlightenment, apply a rigorous critique to popular culture (especially what they call "the culture industry" of Hollywood and jazz music). They argue that popular culture destroys the careful distinctions between the object of high culture (the elevation of the individual as an autonomous subject) and that of popular culture (the degradation of the subject into the position of the nonthinking object). Popular culture as a means of production of a compliant body politic is at the core of the theory of hegemony as developed by the Italian theorist Antonio Gramsci (1891–1937). In a gentle critique of Marx's theory of revolution, Gramsci explains that the reason why the industrial workers of the large capitalist countries did not become a revolutionary force was that capitalism makes enough minor cultural concessions to them (primarily minor commodities) to assure their acquiescence. For Gramsci, keeping the cultural programs of the Italian Fascist state in mind, the process of producing a compliant body politic, what he calls hegemony, is mapped onto the process of participation in popular culture. In a tone more celebratory of popular culture, the German critic and philosopher Walter Benjamin (1892–1940) notes how the availability of mechanical reproduction of art problematized the notions (in his view outdated) of genius and creativity. Benjamin proposed that proletarian art might thus be able to participate in the production of a form of culture that would neutralize the distinction between high and low.

The French cultural theorist Jean Baudrillard (1929–2007) in Symbolic Exchange and Death attempts to provide a radically different theory of culture. He first presents his theory of the simulacrum as the delineation of the relationship between reality and its artistic reproduction. For example, Disneyland is the result of simulation of the reality of southern California in the 1930s and 1940s as it had been represented in the comic cartoons of Mickey Mouse, which, in its turn, has been simulated as its actualization in the United States of the 1950s. In this sense the comic cartoons simulated southern Californian realities in the 1930s and 1940s, which southern California simulated in the 1950s and then Disneyland represented in the 1960s. Baudrillard then substitutes the notion of symbolic
exchange for the classic Marxist notion of exchange value, claiming that symbolic exchange (e.g., the living providing prayers for the salvation of the dead in exchange for the intercession of the dead with God on behalf of the living) dislocates utility from the center of the exchange system and replaces it with a cultural value that rests on a symbolic rather than a monetary value system.

CULTURE, LOW AND HIGH
Discussions and analyses of culture are common in the social sciences. Sociologists, anthropologists, and other social scientists are often interested in similarities and differences between groups and societies. An important component of social scientific research on culture revolves around the question of stratification. In other words, are some cultures more valued than others?

According to sociologist Herbert Gans, cultures can be divided according to various tastes. In his article American Popular Culture and High Culture in a Changing Class Structure (1986), Gans argues that “taste cultures” are the “array of arts, and forms of entertainment and information, as well as consumer goods available to different taste publics” (pp. 17–18). Taste cultures fall into at least five categories, each differing by preferences in literature, art, consumption patterns, hobbies, and other leisure activities. According to the author, the categories are different, but not implicitly unequal.

However, empirical evidence suggests that not all cultures are equally valued. A stratification system exists in which some cultures are considered “high” cultures while others are considered “low.” According to Tia DeNora (1991), the differential valuation of cultures has been present throughout history in a variety of nations and is maintained through an array of institutional practices.

The difference between high culture and low culture is somewhat arbitrary. Both types of culture involve tastes in music, art, literature, and various material goods, for example, so the distinction generally revolves around specific types of tastes within those categories. High culture, in general, involves an interest in classical music or opera, fine art, gourmet foods, and so forth. Low culture tastes, in contrast, fall outside of these particular preferences.

Because high culture is valued more highly than other forms, several advantages are bestowed upon those who participate in high cultural activities. According to Pierre Bourdieu (1977), participation or interest in high culture leads to a form of capital that can be used to produce various types of “profits.” For example, several scholars have argued that children who possess cultural capital are advantaged in the school system because teachers may “communicate more easily with students who participate in elite status cultures, give them more attention and special assistance, and perceive them as more intelligent or gifted than students who lack cultural capital” (DiMaggio 1982, p. 190). Numerous empirical studies have supported this claim. Students with higher degrees of cultural capital tend to have higher grades, higher educational attainment, and higher educational expectations.
Theoretically, the opportunity to obtain cultural capital is open to all members of a society. However, there is a strong correlation between cultural capital and socioeconomic status. Since cultural capital is likely to be obtained through socialization, family background strongly influences whether or not individuals will have access to opportunities that could increase their levels of capital. According to Gans, “it takes money to buy culture” (1986, pp. 18–19). Those with low incomes may be unable to afford to participate in high culture activities. Other factors that can affect the accumulation of cultural capital include educational attainment and occupational status. To be able to understand and appreciate high culture, one may need to have a particular level of education. Because information about cultural events is likely to be transmitted through social networks, occupation status becomes important. Because the poor have lower incomes, lower levels of education, and fall into the lower levels of the occupational hierarchy, they may be excluded from opportunities to participate in high culture activities, which will limit the amount of cultural capital they, and their children, possess.

Members of racial and ethnic minority groups may also be excluded from opportunities to obtain cultural capital, partially due to those factors that exclude the poor in general. Members of minority groups are disproportionately represented in the lower classes of society, have lower levels of educational attainment, and are underrepresented in professional occupations. Therefore, like poor whites, they may lack opportunities to participate in high culture activities. However, minority groups may face further exclusion based on various unique circumstances they face as a result of racial or ethnic group status.

As high culture, to a great extent, is synonymous with Euro-American culture, those who are not Euro-American may be particularly disadvantaged with regard to access to cultural capital. According to Paul DiMaggio and Francie Ostrower (1990), historical practices involving overt discrimination excluded African Americans from fully participating in high culture activities. For example, various museums either denied or limited access to blacks, black artists and white artists were segregated, and audiences were often separated by race. Discrimination in education, the economy, and other institutions also played a role in limiting cultural opportunities.

Although opportunities for blacks have expanded since the 1960s, both past and present discrimination may continue to limit access. As noted earlier, race continues to affect socioeconomic status. Due to high degrees of educational and occupational segregation, blacks may lack access to important forms of economic and social capital that could contribute positively to participation in high culture activities. According to DiMaggio and Ostrower, blacks may also participate less in high culture because the benefits of doing so vary by race. For example, attendance at high culture events may be uncomfortable for blacks, as they may be less familiar with these environments, or may be subjected to “‘social slurs, unpleasant incidents,’ and discrimination” (DiMaggio and Ostrower 1990, p. 758). Therefore, the cost of attendance may outweigh the benefits.

Another important factor to consider is that of taste. DiMaggio and Ostrower find that blacks, for example, are more likely to attend or participate in events that involve jazz, soul, rhythm-and-blues, and other forms of music. Because these tastes are historically associated with African American culture rather than Euro-American culture, they tend to be valued less. Since these tastes are not considered to be as valuable or prestigious, blacks may be excluded from the rewards they might otherwise have received by conforming to dominant cultural tastes.

In conclusion, cultures are not only different but also unequal. Since participation in high culture activities is dependent upon factors such as socioeconomic status, equal opportunity, and taste preferences, poor and minority group members may be excluded from participation, and may therefore also be excluded from the benefits that accompany involvement.

CULTURE OF POVERTY
The theory of a “culture of poverty” was created by the anthropologist Oscar Lewis in his 1959 book, Five Families: Mexican Case Studies in the Culture of Poverty. The culture of poverty theory states that living in conditions of pervasive poverty will lead to the development of a culture or subculture adapted to those conditions. This culture is characterized by pervasive feelings of helplessness, dependency, marginality, and powerlessness. Furthermore, Lewis described individuals living within a culture of poverty as having little or no sense of history and therefore lacking the knowledge to alleviate their own conditions through collective action, instead focusing solely on their own troubles. Thus, for Lewis, the imposition of poverty on a population was the structural cause of the development of a culture of poverty, which then becomes autonomous, as behaviors and attitudes developed within a culture of poverty get passed down to subsequent generations through socialization processes.

Critics of the culture of poverty theory have pointed out several flaws within both the theory itself and the ways in which it has been interpreted and applied to society. The culture of poverty assumes that culture itself is relatively fixed and unchanging—that once a population exists within the culture of poverty, no amount of intervention in terms of the alleviation of poverty will change the cultural attitudes and behaviors held by members of that population. Thus public assistance to the poor, in the form of welfare or other direct assistance, cannot eliminate poverty, since poverty is inherent in the culture of the poor. Following this reasoning, the culture of poverty theory shifts the blame for poverty from social and economic conditions to the poor themselves. The theory acknowledges past factors that led to the initial condition of poverty, such as substandard housing and education, lack of sufficient social services, lack of job opportunities, and persistent racial segregation and discrimination, but focuses on the cause of present poverty as the behaviors and attitudes of the poor.

Much of the evidence presented in support of the culture of poverty suffers from methodological fallacies, particularly a reliance on the assumption that behavior derives solely from preferred cultural values. That is, evidence of poverty itself, including rates of unemployment, crime, school dropout rates, and drug use, are assumed to be the result of behavior preferred by individuals living within conditions of poverty. The culture of poverty theory presumes the development of a set of deviant norms, whereby behaviors like drug use and gang participation are viewed as the standard (normative) and even desired behaviors of those living in the ghetto. An alternative explanation is that individuals behave in ways that are nominally illegal, like participation in the underground economy or participation in gangs, not because they wish to do so or are following cultural norms, but because they have no choice, given the lack of educational and job opportunities available in their neighborhoods. In other words, individuals living in the ghetto may see themselves as forced to turn to illegal methods of getting money, for example by selling drugs, simply to survive within the conditions of poverty. Thus so-called “ghetto behaviors” are adaptive, not normative, and given sufficient opportunities, individuals within the ghetto would eagerly turn to conventional means of earning a living.

The culture of poverty theory has had a tremendous impact on U.S. public policy, forming the basis for public policy toward the poor since the early to mid-1960s and strongly influencing President Lyndon Johnson’s War on Poverty. In 1965 Senator Daniel Patrick Moynihan authored a report entitled “The Negro Family: The Case for National Action.” In the report Moynihan stated that poor blacks in the United States were caught in a “tangle of pathology,” the core reason for which was the breakdown of the black family—specifically the decline of the traditional male-headed household, resulting in a deviant matriarchal family structure. In Moynihan’s conception, this family breakdown was responsible for the failure of black males to succeed, both in school and later in jobs, and that this failure was transmitted down generations. Moynihan argued that the origins of this deviant family structure lay in slavery, where the destruction of the “traditional” family “broke the will of the Negro people,” particularly black males. This sense of powerlessness led to, in essence, a culture of dependency.

The related notions of a culture of poverty and a culture of dependency have become the foundations for antipoverty legislation, such as Temporary Assistance for Needy Families, enacted in 1997 and reauthorized in 2005 as a part of welfare reform. This and other programs rely on the assumption that behavior generates poverty, citing the need to end the dependence of the poor on government benefits and promote work and marriage as social norms. Among scholars, sociologists in the field, and government policy makers, the debate as to whether poverty stems from social, political, and economic conditions or from entrenched behaviors on the part of the poor themselves, continues.

CUMULATIVE CAUSATION
Cumulative causation refers to a self-reinforcing process during which an impulse to a system triggers further changes in the same direction as the original impulse, thus taking the system further away from its initial position in virtuous or vicious circles of change that may result in a continuing increase in advantages (to some people or activities) and disadvantages (to others).

The term cumulative causation was coined by the Swedish economist Gunnar Myrdal (1898–1987), even though the basic hypothesis first appeared in American economist Allyn Young’s (1876–1929) analysis of economic progress (“Increasing Returns and Economic Progress,” 1928). In An American Dilemma (1944), Myrdal used the concept of cumulative causation to explain race relations in the United States. In a vicious circle of social determination, the prejudice of the white populations and the low living standards of the black populations could reinforce each other in a downward spiral: a decline in black living conditions could worsen white prejudice and trigger institutional discriminatory processes, further deteriorating black Americans’ standards of living.

In Myrdal’s analysis, the circular interdependence between social, economic, and political forces, by hindering identification of the “primary” factors (e.g., economic) behind social issues, challenges traditional scholastic boundaries among the social sciences. Fundamentally, Myrdal’s notion of cumulative causation conflicts with the concept of “stable equilibrium” (central to most social sciences, particularly to economics)—that is, the self-stabilization properties of the social system, whereby a disturbance to it will trigger a reaction directed toward restoring a new state of balance between forces. In Economic Theory and Under-Developed Regions (1957), Myrdal addressed the failure of neoclassical economic theory to account for the persistence and widening of spatial differences in economic development within and between countries. He ascribes these differences to cumulative processes, whereby regions or nations that gain an initial advantage maintain and expand it as they attract migration, capital, and trade to the detriment of development elsewhere, an idea that permeates the voluminous “non-formal” literature on “uneven development” of the 1960s and 1970s.

As discussed in the valuable surveys by Amitava Dutt (1989) and William Darity and Lewis Davis (2005), in the 1970s and 1980s cumulative causation was incorporated into formal models of “North-South” trade and growth and into models of the “structuralist” tradition that explicitly recognized structural and institutional asymmetries between industrial (“Northern”) and developing (“Southern”) countries. These models challenged the static neoclassical framework and captured explicitly, by means of dynamic analyses based on differential equations and phase diagrams, the role of history in the evolution of economic processes, resulting in unorthodox effects of trade and in cumulative processes of diverging growth and incomes between countries.

Cumulative causation is also central to the view of economic growth as a “learning process” (resulting from virtuous circles of specialization and technical progress) that emerged in the 1960s and 1970s (e.g., Arrow 1962). However, its assimilation into mainstream economic theory was hampered by the difficulty of modeling “increasing returns,” on which it inherently relies. Inspired by Adam Smith (1723–1790) and Alfred Marshall (1842–1924), Young (1928) emphasized how increasing returns stem primarily from the process of the division of labor and specialization in production. In Young’s virtuous circle, an expansion of the market deepens the division of labor, ensuing in cumulative increases in production efficiency and in market size. Nicholas Kaldor (1966) formalized this idea in his four-stage model of
industrial development. In Paul Krugman's model (1981), increasing returns in manufacturing effect, via virtuous circles of capital accumulation and cost reductions, uneven patterns of industrialization. Increasing returns are crucial to the self-reinforcing cumulative nature of economic processes and became central to most of the “endogenous” growth literature (whereby growth is generated within the economy), pioneered by Paul Romer (1987), which accounts for persistent international inequality.

The “new” economic geography literature that emerged in the 1990s formalizes cumulative causation mechanisms that account for the uneven geographical distribution of economic activity. Regions or countries with similar underlying structures are shown to endogenously differentiate into a rich “core” and a poor “periphery,” as production of manufactures concentrates where the market is larger, which in turn will occur where the concentration of manufactures is higher. In Krugman’s seminal paper (1991), the tendency for firms and workers to cluster together as economic integration increases is driven by the interaction of labor migration across regions with increasing returns and transport costs. Larger markets attract more firms, which in turn attract more workers. The larger population eases competition in the labor market and thus attracts more firms.

In Anthony Venables’s (1996) model, agglomeration of industry occurs via cumulative processes triggered by input-output linkages between “upstream” intermediate producers and “downstream” final-good firms. With increasing returns to scale, upstream firms have an incentive to concentrate where there is a large downstream industry to produce at a more efficient scale. This in turn will make it attractive to downstream firms to locate where there is a large upstream industry, as the cost of the intermediate goods will be lower there. These models, in which the market output depends on the initial conditions, offer a neat formalization of Myrdal’s idea and capture the role of history in determining spatial differences in development, acknowledging how minor changes in the socioeconomic environment may result in large and self-perpetuating asymmetric geographical configurations.

CURRENCY

In economics and finance, currency refers to paper money and coins that represent the monetary base of a country. Currency is a form of money, which is used primarily as a medium of exchange. In international economics, the word currency is used mostly as a reference to foreign currency, the monetary unit of a foreign country.

Currency developed because of the need for a unit of exchange that would be portable, nonperishable, and easily divisible. It appeared with a shift from commodity money to coins made out of precious metals. Currency further developed into fiat money, money that carries no intrinsic value, such as coins made out of nonprecious metals and banknotes, the paper money that is used in most countries today. In the form of fiat money, currency’s
value is based on the universal acceptance of the currency for payments. For a given level of a country’s output, the more currency that is in circulation, the higher would be the level of prices in the country.

Many countries have their own national currency, such as the dollar in the United States. There are some countries, however, that do not have their own currency. Economists separate the latter into two groups: those that belong to a common currency area, and those that simply use foreign currency for transactions in their countries. An example of a common currency area is the European Monetary Union. The members of the European Monetary Union all use the same currency, the euro. Countries and regions that use foreign currency are Panama, Ecuador, and El Salvador, which use the U.S. dollar; Kosovo and Montenegro, which use the euro; and small countries and island nations that use the currencies of their closest neighbors or the country that had formerly governed them as a protectorate. Such economies are referred to as dollarized, even if the currency they use is not called “the dollar.”

The amount of currency in circulation is determined by the monetary authority of the country and represents one of the instruments of the country’s monetary policy. In the United States, the monetary authority is the Federal Reserve System. In the European Monetary Union, the European Central Bank, which includes representatives from all the member countries, determines the amount of currency in circulation. Dollarized countries cannot influence the amount of currency in circulation and therefore do not have an independent monetary policy.

Should each country have its own currency? This question, first analyzed in modern economics literature by Robert Mundell (1961), has been the subject of heated debate ever since. Mundell’s theory suggests that two countries should have a common currency if monetary efficiency gain outweighs economic stability loss from having a common currency. This will more likely be the case if the two countries are closely integrated through trade, capital, and labor mobility. Many economists believe that the European Monetary Union is not an optimum currency area because the economies that represent it are too diverse and are not sufficiently integrated. On the other hand, most economists agree that the United States is an optimum currency area, and that it would be costly for each state to use its own currency. Some believe that the world can benefit from the introduction of the single global currency, but most economists think it is not a good idea because independent monetary policy is important to stabilize both real goods and asset markets in conjunction with fiscal policy.

CURRENCY APPRECIATION AND DEPRECIATION

In economics, the terms currency appreciation and currency depreciation describe the movements of the exchange rate induced by market fluctuations. If a country is fixing the exchange rate, official adjustments to the fixed exchange rate are called currency revaluation and devaluation. Currency appreciates when its value increases with respect to the value of another currency or a “basket” of other currencies. Currency depreciates when its value falls with respect to the value of another currency or a basket of other currencies.

These special terms have to be used because exchange rates can be expressed in different ways, so that using the words “rise” and “fall,” or “increase” and “decrease,” for changes in the exchange rate can be confusing. For example, if the exchange rate between the U.S. dollar and the euro is expressed in dollars per euro (e.g., 1.20 dollars per euro), an increase in the exchange rate (e.g., to 1.25 dollars per euro) means that the dollar depreciates with respect to the euro and the euro appreciates with respect to the dollar. In other words, the dollar becomes less valuable and the euro becomes more valuable. The same exchange rate can be expressed in euros per dollar (e.g., 0.83 euros per dollar). In this case, an increase in the exchange rate (e.g., to 0.9 euros per dollar) means that the dollar appreciates with respect to the euro and the euro depreciates with respect to the dollar.

In the short run, currency appreciations and depreciations are driven by changes in demand and supply for a currency in the foreign exchange market. The demand and supply of currency depend on a country’s imports and exports, international financial transactions, speculations on the foreign exchange market, and, under “dirty float,” government interventions in the foreign exchange market. In the long run, currency appreciations and depreciations are determined by the inflation rate and economic growth of the country.

Forecasting currency appreciations and depreciations turns out to be a big challenge for economic theorists. In a 1983 paper titled “Empirical Exchange Rate Models of
the Seventies: Do They Fit Out of Sample?” Richard Meese and Kenneth Rogoff demonstrated that a simple statistical model of the random walk—which states that the best forecast of the exchange rate tomorrow is the exchange rate today—does a better job at forecasting the exchange rate than any of the economic models available at that time. In addition, economic researchers have shown that the exchange rate tends to be “disconnected” from the fundamentals, or the factors that usually affect the exchange rate in economic models. These findings are known as the Meese-Rogoff puzzle and the “exchange rate disconnect” puzzle, respectively. In a 2005 paper, “Exchange Rates and Fundamentals,” Charles Engel and Kenneth West demonstrated that given the statistical properties of the fundamentals and the discount factor of the individuals (the weight they place on future consumption relative to today’s consumption), it should be expected that exchange rate behavior is similar to a random walk.

In a 2002 paper, “Order Flow and Exchange Rate Dynamics,” Charles Evans and Richard Lyons took another approach. They showed that using information on the demand and supply of foreign currency (the order flows by the banks participating in the foreign exchange market), it is possible to forecast currency appreciation and depreciation in the short run better than using the random walk.

Currency appreciation and depreciation affect all the international transactions of a country because they affect international relative prices. In international trade, currency appreciation makes a country’s exports more expensive for the residents of other countries if exporters in that country can increase the prices at which they sell their goods to foreign customers. If the exporters cannot increase their sale prices due to competition, their profits fall because the cost of production, which is denominated in their domestic currency, rises relative to their revenues, which are denominated in the foreign currency. If the profits decline a lot, some firms will stop exporting, so that the volume of exports from a country experiencing currency appreciation will decline. The reverse is also true: Currency depreciation will make a country’s exports more competitive, increase exporters’ profits, and increase the volume of country’s exports.

Similar mechanisms link currency appreciation and depreciation to a country’s imports. If a currency appreciates, the country’s residents will find imported goods inexpensive relative to goods produced domestically, and the volume of imports will increase. Likewise, if a currency depreciates, the country’s residents will find that imported goods are very expensive, and they will prefer to switch to buying goods produced domestically, thus lowering the volume of imports. Such changes in trade pattern occur in response to the long-run changes in the exchange rate, and they develop slowly over time because international trade contracts are written well in advance.

Currency appreciation and depreciation also affect international asset trade and the value of the holdings of foreign assets. If a domestic currency depreciates, the value of that country’s residents’ foreign currency asset holdings increases (because foreign currencies become relatively more valuable), while the value of foreigners’ holdings of that country’s assets declines. These changes can be described as capital losses and gains due to changes in the exchange rate. In the beginning of the 2000s, the U.S. dollar experienced substantial depreciation. While the United States continued to borrow abroad, its total debt to foreigners did not increase, because dollar depreciation meant capital gains for the U.S. residents and capital losses for the foreigners, which offset new borrowing by U.S. residents. This effect is known in economic literature as a valuation effect of exchange rate changes. Cédric Tille, in his 2003 paper “The Impact of Exchange Rate Movements on U.S. Foreign Debt,” calculated the exact contribution of the valuation effect to the international financial position of the United States.

When a country accumulates a large amount of foreign currency debt, a sharp depreciation of its currency can be very harmful. If firms’ revenues or assets are denominated in their own currency while their debts or liabilities are denominated in foreign currency, the currency depreciation will lower the value of firms’ assets relative to liabilities, sometimes so much that firms become bankrupt. Such an effect is known in the economic literature as the balance sheet effect. During the financial crises of the late 1990s, the negative balance sheet effects of currency depreciations outweighed their positive effects on exporters’ profits. This experience exposed the importance of matching the currency composition of assets and liabilities.

**CURRENCY DEVALUATION AND REVALUATION**

In economics, the terms *currency devaluation* and *currency revaluation* refer to large changes in the value of a country's currency relative to other currencies under a fixed exchange rate regime. These changes are made by the country's government or monetary authority. If a country has a floating exchange rate regime, or if the changes in the exchange rate under a fixed exchange rate regime are small (within the boundaries allowed by the government), the changes in the exchange rate induced by market fluctuations are referred to as *currency depreciation* and *appreciation*.

When a government conducts a devaluation, or devalues its currency, it changes the fixed exchange rate in a way that makes its currency worth less. When a government conducts a revaluation, or revalues its currency, it changes the fixed exchange rate in a way that makes its currency worth more. Since the exchange rates are usually bilateral, an increase in the value of one currency corresponds to a decline in the value of another currency. The convention is to use the term that describes the origin of the policy change. For example, during the period when the Bretton Woods system of currencies was in use (from 1944 to 1973, when many currencies were fixed to the U.S. dollar and the U.S. dollar was fixed to gold), there were cases of devaluations and revaluations. Figure 1 shows how, in November 1967, the British pound was devalued with respect to the U.S. dollar from 2.8 dollars per pound to 2.4 dollars per pound. The pound thus became less valuable with respect to the U.S. dollar, while the dollar became more valuable with respect to the pound. Such an episode is referred to as pound devaluation, rather than a dollar revaluation, because it was originated by the British government.

Before World War II (1939–1945), many countries were fixing their currency to gold. In order to improve the competitiveness of their exporters, the countries engaged in competitive “beggar-thy-neighbor” devaluations, meaning that one country would devalue its currency (with respect to gold and therefore with respect to all other currencies that were pegged to gold) and another would devalue in response. Such competitive devaluations were harmful for the international financial system overall. One reason behind the establishment of the Bretton Woods system and the International Monetary Fund (IMF) in July 1944 was to avoid such competitive depreciations in the future. The charter of the IMF directs policymakers to avoid “manipulating the exchange rates … to gain an unfair competitive advantage over other members.”

Governments usually fix the exchange rates to allow for stable conditions in foreign trade or to fight high levels of inflation driven by high inflationary expectations. In the fixed exchange rate regime, the exchange rate is not determined by the markets. It can therefore deviate from the equilibrium exchange rate, creating disequilibrium in international prices. Thus, countries that fix their currency frequently find themselves in a situation in which their currency is either overvalued (is worth more than in equilibrium) or undervalued (is worth less than in equilibrium). In the case of overvalued currency, the government has to keep selling foreign exchange reserves in exchange for domestic currency to take the currency out of circulation. Conversely, when the currency is undervalued, the government may seek to devalue the currency in order to increase its international competitiveness.
for domestic currency in order to maintain the value of domestic currency above equilibrium. When the reserves run out (or, as Paul Krugman showed in his 1979 article “A Model of Balance-of-Payments Crises,” even before the reserves run out), the country has to either devalue the currency or let it float and depreciate while adjusting to its equilibrium exchange rate. Most countries with fixed exchange rate regimes either devalued their currency or switched to a floating exchange rate regime within less than five years after the initiation of the peg (Rose 2006).

The situation is different when the currency is undervalued. In order to keep the value of domestic currency below equilibrium, the government has to keep selling domestic currency in exchange for foreign currency. In this case, the government accumulates foreign exchange reserves and can always print more domestic currency. Thus, there is no well-defined limit on such foreign exchange interventions. Because the cases of undervalued currency are less common, they are less studied in economic literature than cases of overvalued currency.

The most discussed case of undervalued currency is the Chinese renminbi. China was fixing its exchange rate to be equal to 8.3 yuan (a unit of renminbi) per one U.S. dollar between January 1994 and July 2005, when China revalued the renminbi to 8.11 yuan per one U.S. dollar. After July 2005, the renminbi experienced a small controlled appreciation of about 3 percent per year. At the end of 2006, many economists believed that the renminbi remained undervalued, which explains an increasing amount of export from China (because, for the rest of the world, the goods produced in China seem inexpensive). However, since the equilibrium value of the currency is not observed in the fixed exchange rate regime, there was a disagreement as to how much revaluation would be needed to restore the equilibrium. At one extreme, Barry Eichengreen suggested that China allow its currency to float freely and adjust to its equilibrium level. At the other extreme, Michael Dooley and Peter Garber argued that there was no need for renminbi readjustment at all. There was a whole range of opinions in the middle as well, such as suggesting that China revalue its currency by 10 percent right away and let it float some time later, or that China allow a controlled appreciation of the currency.

As outlined by Andrew Rose in a 2006 discussion paper, most economies that are now open to international capital flows let their currencies float freely, meaning that devaluations and revaluations are slowly becoming a phenomenon of the past.

CURRENT POPULATION SURVEY
The Current Population Survey (CPS) is a survey of fifty thousand to sixty thousand households in the United States that has been conducted monthly since 1940 by the U.S. Census Bureau for the Bureau of Labor Statistics. The CPS has been used extensively by social science researchers to address a wide variety of questions, and it is the source used to compile numerous official statistics for the U.S. government.

The CPS emerged from a survey implemented in 1937, the Enumerative Check Census, that attempted to measure unemployment nationwide. One of the largest and most important changes to the survey occurred in 1954 when the number of primary sampling units increased more than threefold. In 1994, due to technological advances in computing, a redesign of the survey was instituted to obtain more accurate and comprehensive information.

THE STRUCTURE OF THE CPS
The CPS is administered to a sample representing the civilian noninstitutional population of the United States living in housing units. (For more on the material in this section, see U.S. Department of Labor 2002.) Each housing unit is in the sample for a total of eight months over a sixteen-month time horizon—four months in, eight months out, and four months in. This rotation cycle ensures that 75 percent of the sample overlaps from month to month and...
50 percent overlaps from year to year. (These need not be the same households, since the CPS is a housing unit–based sample rather than a household-based sample.) The survey is administered mostly by phone interviews with occasional site visits. The information is available at the individual, family, and household level.

The core portion of the CPS contains numerous variables portraying the employment status of all members of the households over the age of sixteen, including items such as their status in the paid labor force, occupation, number of hours worked, and reasons for not working. In addition, information on such subjects as age, sex, race, ethnicity, and education is collected. The CPS also collects supplemental data from additional questions besides the core content of the survey. Areas of supplemental data include length of time spent in the same occupation, reasons for changing occupations, use of unemployment benefits or health insurance benefits, migration, citizenship status, birth history, childcare, school enrollment, food insecurity, and food expenditures. Of particular note is the March Supplement of the CPS, where extensive information on income and its sources is garnered along with other relevant demographic variables, including participation in assistance programs.

RESEARCH USES OF THE CPS

CPS data is used by researchers across a wide variety of research topics, including the following four areas. First, researchers and government policymakers use the CPS to assess the nation’s economic situation and to obtain unemployment data and information regarding participation rates in the paid workforce. Specific areas examined include wage gaps among different races across different occupations, recent trends in economic status across races, and the hiring and firing experiences of different groups of people. Along the same lines, general income data is generated that is used to address such issues as income distribution among occupations, stability of earnings of males and females in marital relationships, and the relationship between stock market performance and retirement behavior.

Second, data from the CPS is used to study the well-being of families and children. The CPS aids in understanding the prevalence and severity of poverty, the determinants that lead to poverty, and the determinants of participation in government programs, such as the Food Stamp Program (e.g., Gundersen and Offutt 2005). One of the more visible reports is the annual report on income, poverty, and health insurance coverage in the United States (DeNavas-Walt et al. 2004, 2005).

Third, health issues and insurance coverage have been examined utilizing CPS data. Workplace policies to reduce smoking prevalence among workers have been investigated along with job attainment and the number of hours worked among ill individuals. Researchers have also studied the effect of Medicaid care provided by clinics and hospitals on insurance coverage, as well as gaps in health insurance coverage between different races and between men and women.

Fourth, CPS data has been used to explore issues in education. Such topics include the gap in early education between children of different income groups, the influence of maternal age on children’s disability status and school progress, and factors influencing educational attainment of immigrant children, adolescents, and adults. Additionally, researchers have explored the relationship between access to home computers and improved educational outcomes.

CURRICULUM

Curriculum theory, research, and reform have long been informed by a question posed by Herbert Spencer in 1861: “What knowledge is of most worth?” This question has continued to be examined and revised through significant educational and curricular reform movements. As a result, the competing interests of teachers, administrators, academicians, politicians, parents, and other stakeholders have led to a struggle for control of the American curriculum.
There are four major U.S. curricular initiatives that can be identified in the history of curriculum development and reform: (1) academic rationalism, (2) the social efficiency model, (3) progressive education, and 4) social reconstructionism. While each of these movements experienced varying degrees of support and criticism throughout the twentieth century, they more often overlapped in terms of development. For example, the academic rationalist orientation, with its roots during the Enlightenment, focused on the “Great Books” as the foundation of the Western cultural tradition. The goal of this approach, which was very popular at the turn of the century, was to develop the student’s mind to tackle life’s ultimate purpose, which was seen as a quest for truth, beauty, goodness, and liberty. Academic rationalism, however, continued to have strong support throughout the century. Beginning in the 1920s and continuing into the 1960s with the space revolution, the social efficiency model emphasized the efficient nature of the curriculum through operationally designed skills and knowledge. John Dewey’s progressive education movement was especially popular during the first two decades of the twentieth century, and advocated a child-centered approach that allowed the curriculum to accommodate children’s natural interests, and thus grow directly from the interests of the child. Lastly, the 1930s saw the advent of the social reconstructionist conception which posits that the curriculum should stress the needs of society over the needs of the individual, redress social injustice, and serve as an agent for social change (Schubert, 1986).

Although each curricular orientation has been vital in the formation of American schooling, the most recent, and most controversial, has been social reconstructionism. One of the most prominent proponents of social reconstructionism was the Brazilian scholar Paulo Freire (1921–1997). In his seminal work Pedagogy of the Oppressed (1970), Freire argued that only through “conscientization” can people liberate themselves from political and economic oppression. According to Freire, conscientization is the process by which the individual achieves a deep awareness of the social and cultural reality that shapes his or her life, and of the individual’s ability to transform that reality (Freire 1970b).

A product of Freire’s work is the concept of critical pedagogy, which emphasizes that education be viewed as a political, social, and cultural enterprise. In order to appreciate the contribution of critical pedagogy to curricular reform, it is imperative to understand the undeniable relationship between curriculum theory, the power of capital, and the state. For example, in light of the focus on the global marketplace that developed in the late twentieth century, capitalist ideology continuously encourages the consumption of commodities as a mechanism to continue the cycle of accumulation. Within educational settings, this is evident in the push toward integrating corporate management pedagogies within the classroom. As a result, academic success is almost exclusively defined in terms of “capital accumulation and the logic of the marketplace” (McLaren 2002, p. 34). Looking at this phenomenon through a Marxist lens, capitalism diminishes the individual to a commodity that can be bought and sold in the name of profit.

Western society, through the school curriculum, teaches that success can only be achieved through intelligence, hard work, and creativity. This type of pedagogical approach affects teachers, middle-class students, and working-class students. Reforms were initiated in the late twentieth century to provide “teacher-proof state-mandated curricula,” which some see as reducing the role of the teacher to nothing more than a “semi-skilled, low-paid clerk” (McLaren 2002, p. 187). From this perspective, students who possess the dominant cultural assets (e.g., particular ways of talking, acting, and socializing) are rewarded, while those possessing cultural assets of the oppressed are devalued. As a result, the curriculum perpetuates the unjust system of inequality based on cultural capital. As Freire points out, however, this practice is not perpetuated by force (McNeil 1996). Instead, the dominant culture is able to exercise power over subordinate classes through hegemony. Thus, this domination is maintained through consensual social practices, social forms, and social structures.

Critical pedagogy also advocates an analysis of the “hidden curriculum,” or the unintended outcomes of schooling that transmit messages to students through the “total physical and instructional environment” (McLaren 2002, p. 212). The curriculum is inextricably linked to the issue of power not only by culture but also by gender. For example, teachers often allow boys to dominate classroom conversations and offer them more academic praise than girls. While few teachers would admit to intentional sexist ideology, such interactions perpetuate sexist behavior. As a result, girls are often more hesitant to contribute to class discussions. Research also shows that girls are less likely to view themselves as competent in mathematics and science, and by the time they reach high school they are far less likely than boys to enroll in advanced math and science courses (McLaren 2002). Furthermore, girls are more likely to attribute failure to personal factors such as competence and ability.

As a consequence, men and women continue to be affected by the sexist nature of the hidden curriculum well into adulthood. For example, men tend to speak more often than women and frequently interrupt them in both professional and personal settings. It is also more difficult for women to be regarded as experts in their chosen occupations, and they are far less likely to obtain positions of power and authority.
Curriculum, from a critical theorist's standpoint, encourages teachers and students to foster democratic principles in order to question how the curriculum creates inequities between dominant and oppressed groups. Thus, the curriculum could help a society come to terms with its history, helping students understand the inequitable distribution of power and resources common to many nations. Encouraging students to value and articulate their own experiences of injustice are the first steps in creating a new social order.

To date, however, curricular reform in the U.S. that addresses inequity and injustice has been controversial and, at times, considered “dangerous” territory. However, to ignore these issues is to deny students a voice as active, reflective citizens. Just as the current educational system was “made,” it can be “unmade” and “made over” (McLaren 2002). The first and most important step is to remove the fear of questioning the unquestionable and realize the role that the curriculum plays in political, social, and cultural life.

CUSTOMS UNION
Economic integration is the process designed to eliminate discrimination among economic units located within different political boundaries. The traditional categories include Free Trade Area (FTA), Customs Union (CU), Common Market (CM), Economic Community (EC), and Complete Economic Integration (CEI). The various categories delineate the degree to which barriers to economic interaction are formally removed. In an FTA participating countries agree to remove barriers to trade among each other. In a CU the member countries agree not only to remove barriers to trade but also to set common levels of protection against all nonmember countries. Examples of a CU include the 1940s Benelux countries agreement (among Belgium, the Netherlands, and Luxembourg) and the Southern African Customs Union, signed in 1969 and still in existence. The CM agreement goes a step further than a CU agreement by removing barriers to movements of factors (essentially labor and capital) among members in addition to the CU components. An EC represents an additional step toward complete economic integration in that there is some degree of harmonization of national policies where community policies and institutions take precedence over national policies. An example of the latter is the Common Agricultural Policy of the European Economic Community.

A formal definition of a CU was provided by the General Agreement on Tariffs on Trade (GATT) in 1952:

A customs union shall be understood to mean the substitution of a single customs territory for two or more customs territories, so that (i) duties and other restrictive regulations of commerce are eliminated with respect to substantially all the trade between the constituent territories of the union … and (ii) substantially the same duties and other regulations of commerce are applied by each of...
the members of the union to the trade of territories not included in the union.

The implementation of a CU represents a reduction in protection between member countries, but it keeps in place discriminatory policies against nonmember countries. Although the former represents a clear movement toward less restricted trade and increased world welfare, the discrimination against nonmembers represents a potential loss in world trade and welfare. Thus whether a CU represents an overall movement toward less restricted trade and increased world welfare depends on the relative strength of these two forces, which are typically discussed as the static effects of economic integration under the categories of Trade Creation and Trade Diversion.

Trade Creation refers to the shift from higher-cost domestic producers to lower-cost partner producers. It is thus a shift from less efficient to more efficient production and is trade expanding. It also reflects a gain in country welfare. Trade Diversion refers to the shift from lower-cost nonmember suppliers to higher-cost partner suppliers, which takes place because of the tariff faced by nonmember products. It thus represents a loss in efficiency and a decrease in welfare. There are also accompanying consumption effects as consumers switch from domestic products to the now cheaper import products. Whether or not the CU represents a movement toward less restricted trade and enhanced welfare in the static sense depends on the relative size of these two effects. Whether the overall effect is positive or negative depends on a number of considerations, including the complementarity or competitiveness of the individual economies, the size of transportation costs between member countries, the height of tariffs before and after integration, the economic size of the member countries, and the elasticities of supply and demand within the member countries. Empirical estimates of the static effects of economic integration have generally been a net, though small, positive.

Economists tend to agree that the major benefits of economic integration occur because of the dynamic effects associated with increased economic interaction between member countries. These dynamic considerations include the benefits associated with a more competitive economic environment, which reduces the degree of monopoly power that possibly existed in the preintegration environment. In addition, access to larger markets within the integrated area may result in economies of scale in the expanding export sector as a result of both internal and external economies of scale. The growing and more profitable economic environment may also generate greater investment from both internal and external sources. Finally, there may also be dynamic benefits resulting from increased economic interaction with other countries in terms of increased access to technology, foreign institutions, and cultural factors.

CYBERSPACE

The term cyberspace, was originally a creation of late twentieth-century science fiction, and it has come to have two extended uses. In technical training contexts, it has become a useful handle for the notion of “space” a person (or “user”) enters when logging on to a computer. In a social science context, the term refers to new social spaces fostered by computer-enabled automated information and communication technologies (AICTs). Often, those using cyberspace in this way confer on it important, and even transformative, impacts on “real life” social relations. However, a tendency to assume transformation without demonstrating it means descriptions of cyberspace should be approached with caution.

The term was first used by William Gibson in his 1984 novel Neuromancer. By making an electronic connection, or “jacking in,” to networked computers, a character in the novel entered into “cyberspace,” an alternative and rather dark social universe whose interaction with real life drove the novel’s plot. Shedding negative connotations, “navigating in cyberspace” became a helpful metaphor for the experiences of getting around a com-
puter’s virtual “desktop,” navigating in and out of open software “windows,” or projecting a personal “avatar” in an online virtual game or business communications environment.

As computers appeared in more and more human activities, technology talk was similarly cyberspaced. This use paralleled the late twentieth-century, popular use of the term technology, which was often equated linguistically with advanced technological forms and innovations. Thus, the realm of technology became coterminous with cyberspace.

It is now common in social science to critique such uses of technology, and thus to be suspicious of cybertalk. Since all cultures are substantially mediated by technologies of one sort or another, to equate the technological with cyberspace is ethnocentric. In the field of STS (science and technology studies), technology is used analytically to refer to any complex of artifacts, actors, and practices. Still, social scientists interested in the relationship between technology and social change (e.g., Hakken 1999) have found interactions between cyberspace and real life to be a convenient point at which to start analyzing the dynamics of hybrid (computerized and noncomputered) social spaces.

The term information technology (IT) also became widely used in this period; it was used to refer to any system of practices involving devices for automatically storing and manipulating digitized information (e.g., computers). IT shifts the focus away from a particular computing machine to the broadening range of more general systems in which it becomes embedded. Particularly with the rise of the Internet and similar technologies of communication with embedded IT, scholars began to talk more about information and communication technologies (ICTs). What is distinctive about computer-mediated ICTs, and thus of cyberspace, is the extent to which information storage, manipulation, and communication take place according to protocols built into hardware and software.

Like other labels, such as Information Age or Knowledge Society, cyberspace tends to be equated with epochal social change. AICTs are presumed to play a seminal, causal role in globalization (see Friedman 2005). Such presumptions fit neatly into long traditions of theorizing, from Leninist Marxism to postmodernisms, that privilege technologies as engines of social change. In the long, especially American version of technological determinism, the impact of any other social dynamics on technologies is largely ignored.

Ironically, the social correlates of automated ICTs, and the dynamics of cyberspace, become both more pronounced and harder to see. The attribution of transformational changes in social relations to the adoption of AICTs is reinforced by, and reinforces, popular perceptions of massive, technology-induced social change. That AICTs automate processes (make them more rapid, more far-reaching, etc.) is what gives them their potential to transform. Yet in carrying out interactions among data, information, and knowledge “behind our backs,” AICTs also make these social processes more opaque. The political and social theorist Langdon Winner points to a dazzled, computing-induced “technological somnambulism” that has made the age of cyberspace an era of “mythinformation” (Winner 1984).

Thus, there is a belief that cyberspace colonizes real life, that the new social relations engendered by computing first influence and then come to dominate what went before. Its popularity explains why social science attends to cybertalk, but to many observers it should do so as hypothesis, not as presumption. Social scientists need to explore the ways in which the social dynamics of computer-mediated spaces are influenced by, as well as influence, other social dynamics. Some, such as Frank Webster, have studied cyberspace in this even-handed empirical manner, and those with long ethnographic involvement in cyberspace tend to document social continuities between cyberspace and other social dynamics. Yet even this work too often complexifies its own interpretation, performing transformationalist rhetoric irrespective of—and often in contradiction to—its own empirical results.

In practice, university courses on the social impacts of computing outnumber those on the impacts of social processes on computing. The pervasive sense that transformative social change is inevitable, and therefore not worth thinking about too much, may follow functionally from the actions of powerful social forces that have an interest in promoting this view. For all these reasons, social research on cyberspace, like most popular musings on technology, needs to be approached with skepticism.

DAHL, ROBERT ALAN
1915–
Robert Dahl, Sterling Professor of Political Science, Emeritus, Yale University, and past president of the American Political Science Association (1967), is most widely known as the leading theorist of pluralist theory, the dominant theory in the study of U.S. politics for about ten years after the publication of his *Who Governs?* in 1961. Dahl was the chief originator of this pluralist theory of political power, which needs to be distinguished from other uses of the term *pluralism* in the social science literature. Three of these are: pluralism as the doctrine opposed to the emphasis of the idea of sovereignty of the state; pluralism as the description of societal ethnic diversity; and pluralism as a value preference for furthering ethnic and gender diversity in state policy. Dahl’s pluralist theory of political power often has been mistakenly identified with pluralism as group theory, the idea that political groups are the chief explanatory variable in politics, often carrying the connotation that all groups in the United States are equally free to organize. Dahl explicitly denied this use of pluralism (1961, p. 4; 1982, pp. 207–209).

Dahl’s pluralist theory of political power was developed in distinction to power elite theory, as put forth by C. Wright Mills and by Floyd Hunter. Dahl argued that a sufficient research design for the study of political power should incorporate the following elements: (1) the concept of power as gaining one’s way through changing the behavior of others, and that *power* should not be equated with the resources used to gain power, such as money or prestige; (2) that power should be observed through construction of case studies of political action; (3) that there are different domains of political action, and power in one is not necessarily the same as power in another; (4) that one should define *power* in terms of the goals of the actors themselves, not in terms of some theoretical construct not understood by the actors.

In *Who Governs?* Dahl found that political power in the city of New Haven, Connecticut, was plural; that is, power in each of the different sectors of action was held by different people, except for the mayor, who was powerful in more than one area, but who was accountable to the voters through regular competitive elections. This pluralist theory of political power stated a general model for studying and interpreting political power, and as such, was readily applied in numerous studies of power in cities and towns, in legislatures, in federalist interactions, and even within the executive branches of various governments. Normally, pluralist studies of power in the United States found that power was dispersed within the institution studied.

Although it provided the dominant political science theory in the study of U.S. politics during the 1960s, Dahl’s pluralist theory was soon challenged by a number of arguments. Peter Bachrach and Morton Baratz argued that Dahl provided no method for the study of power over the determination of the agenda for political issues. Theodore J. Lowi Jr. argued that the fragmentation of power in pluralist theory often amounted to the finding of “islands of power,” in which unrepresentative coalitions of interest groups, administrative decision makers, and legislative committees controlled an area of public policy without countervailing power from the legislature as a whole. Mancur Olson Jr. propounded *The Logic of*
Collective Action (1965), which indicated that such dominance of particular public policy areas by unrepresentative coalitions is based on a fundamental logic of group formation. Carole Pateman (1970) and other political philosophers criticized Who Governs? as based on a constricted view of political participation, omitting the classical viewpoint of participation as public discussion of issues affecting the entire community.
